Package 'trackdf'

January 29, 2024

Type Package

Title Data Frame Class for Tracking Data

```
Version 0.3.3
Date 2024-01-28
Maintainer Simon Garnier <garnier@njit.edu>
Description Data frame class for storing collective movement data (e.g. fish
      schools, ungulate herds, baboon troops) collected from GPS trackers or
      computer vision tracking software.
License GPL-3
Encoding UTF-8
LazyData true
RoxygenNote 7.3.1
Depends R (>= 3.5.0)
Imports sf, tibble, data.table, lubridate, methods, dplyr
Suggests readr, ggplot2, mapproj, knitr, rmarkdown, adehabitatLT,
      move, ctmm, moveHMM, sp, terra, covr, testthat (>= 3.0.0)

.Mode

Compute The Mode(s) Of A Discrete Distribution

Description

This is an internal utility function to compute the mode(s) of a discrete distribution.

Usage

```
.Mode(x, na.rm = TRUE)
```

Arguments

x A vector or matrix of discrete values.

na.rm A logical value indicating whether NA values should be stripped before the computation proceeds (default: TRUE).

Value

A vector of values corresponding to the mode(s) of x.

Author(s)

Simon Garnier, <garnier@njit.edu>

reclass 3

.reclass

Maintain Class After Modification

Description

Copy class and attributes from the original version of an object to a modified version.

Usage

```
.reclass(x, result)
```

Arguments

x The original object, which has a class/attributes to copy

result The modified object, which is/might be missing the class/attributes.

Value

result, now with class/attributes restored.

Author(s)

Simon Garnier, <garnier@njit.edu>

bind_tracks

Bind Multiple Track Tables by Row

Description

bind_tracks uses data.table::rbindlist to combine track tables by rows, but makes sure that you cannot bind together two tables with different projections or time zones, that the projection attribute is inherited by the resulting track table, and that track tables based on different table classes are coerced to the same table class.

Usage

```
bind_tracks(...)
```

Arguments

A list containing track table objects, or the names of track table objects separated by commas. The track tables must have the same projection and time zone.

Value

A track table.

4 conversions

Author(s)

Simon Garnier, <garnier@njit.edu>

Examples

```
data(short_tracks)
bind_tracks(short_tracks, short_tracks)
bind_tracks(list(short_tracks, short_tracks))
```

conversions

Convert a Track Table to/from Other Formats

Description

The following methods will convert track tables to and from other common formats used for processing tracking and spatial data.

Usage

```
as_track(x, table = "df", ...)
## S3 method for class 'MoveStack'
as_track(x, table = "df", ...)
## S3 method for class 'Move'
as_track(x, table = "df", ...)
as_{move}(x, ...)
## S3 method for class 'SpatialPointsDataFrame'
as_{track}(x, table = "df", ...)
as_sp(x, ...)
## S3 method for class 'track'
as_sp(x, ...)
## S3 method for class 'ltraj'
as_track(x, table = "df", ...)
as_ltraj(x, ...)
## S3 method for class 'track'
as_ltraj(x, ...)
```

conversions 5

```
## S3 method for class 'telemetry'
as_track(x, table = "df", ...)

## S3 method for class 'list'
as_track(x, table = "df", ...)

as_telemetry(x, ...)

## S3 method for class 'track'
as_telemetry(x, ...)

## S3 method for class 'moveData'
as_track(x, table = "df", type = c("LL", "UTM"), ...)

as_moveHMM(x, ...)

## S3 method for class 'track'
as_moveHMM(x, ...)
```

Arguments

x An object to convert.

table A string indicating the class of the table on which the track table should be built.

It can be a ${\sf data.frame}$ ("df", the default), a tibble ("tbl"), or a ${\sf data.table}$

("dt").

.. Other parameters to be passed to:

• track_df, track_tbl or track_dt if as_track is used.

• sp::SpatialPointsDataFrame if as_sp is used.

• adehabitatLT::as.ltraj if as_ltraj is used.

• ctmm::as.telemetry if as_telemetry is used.

• moveHMM::prepData if as_moveHMM is used.

For converting moveHMM::moveData to track table only, a character string indi-

cating the type of coordinates stored in the ${\tt moveHMM::moveData}$ object: "LL" if

longitude/latitude (default), "UTM" if easting/northing.

Value

type

The coordinates converted in the chosen format.

Author(s)

Simon Garnier, <garnier@njit.edu>

See Also

```
track_df, track_tbl, track_dt
```

6 dplyr_track

Examples

```
## Not run:
data(short_tracks)
if (requireNamespace("sp", quietly = TRUE)) {
  sp <- as_sp(short_tracks)</pre>
  as_track(sp)
}
if (requireNamespace("adehabitatLT", quietly = TRUE)) {
  lt <- as_ltraj(short_tracks)</pre>
  as_track(lt)
}
if (requireNamespace("ctmm", quietly = TRUE)) {
  tl <- as_telemetry(short_tracks)</pre>
  as_track(tl)
}
if (requireNamespace("moveHMM", quietly = TRUE)) {
  hhm <- as_moveHMM(short_tracks, type = "LL")</pre>
  as_track(hhm)
## End(Not run)
```

dplyr_track

Dplyr Methods For Track Tables

Description

dplyr methods for track tables objects.

Usage

```
## S3 method for class 'track'
select(.data, ...)

## S3 method for class 'track'
rename(.data, ...)

## S3 method for class 'track'
filter(.data, ...)

## S3 method for class 'track'
arrange(.data, ...)
```

dplyr_track 7

```
## S3 method for class 'track'
mutate(.data, ...)
## S3 method for class 'track'
transmute(.data, ...)
## S3 method for class 'track'
summarise(.data, ...)
## S3 method for class 'track'
summarize(.data, ...)
## S3 method for class 'track'
group_by(.data, ...)
## S3 method for class 'track'
ungroup(x, ...)
## S3 method for class 'track'
slice_sample(.data, ...)
## S3 method for class 'track'
do(.data, ...)
## S3 method for class 'track'
slice(.data, ...)
## S3 method for class 'track'
semi_join(x, ...)
## S3 method for class 'track'
anti_join(x, ...)
## S3 method for class 'track'
inner_join(x, ...)
## S3 method for class 'track'
left_join(x, ...)
## S3 method for class 'track'
right_join(x, ...)
## S3 method for class 'track'
full_join(x, ...)
## S3 method for class 'track'
nest_join(x, ...)
```

8 duplicated_data

```
## S3 method for class 'track'
distinct(.data, ...)
## S3 method for class 'track'
rowwise(data, ...)
```

Arguments

```
... Additional arguments to be passed to the corresponding dplyr method. data, .data, x A track table.
```

See Also

dplyr

duplicated_data

Find Duplicated Data in a Track Table

Description

This function attempts to automatically detect duplicated data in track tables.

Usage

```
duplicated_data(x, type = "txy")
```

Arguments

x track table as produced by the track function.

type A character string or a vector of character strings indicating the type of dupli-

cations to look for. The strings can be any combination of "t" (for time duplications) and "x", "y", "z" (for coordinate duplications). For instance, the string "txy" will return data with duplicated time stamps and duplicated x and

y coordinates.

Value

A track table of all observations that are duplicated, as per the duplication rule defined by type.

Note

Incomplete data (that is, data containing "NAs") are ignored.

Author(s)

Simon Garnier, <garnier@njit.edu>

filter 9

See Also

track

Examples

filter

Subset rows using column values

Description

This is a re-export of the filter function in the dplyr package. See the help

Arguments

```
.data See filter for an explanation.... Other args
```

inconsistent_data

Find Inconsistent Locations in a Track Table

Description

This function attempts to automatically detect inconsistent locations (for instance due to a writing error or GPS inaccuracies) in track tables.

Usage

```
inconsistent_data(x, s = 15)
```

Arguments

- x track table as produced by the track function.
- s The discrimination threshold for the outlier detection algorithm. Higher values correspond to less outliers.

is_geo

Value

A track table of all inconsistent data.

Author(s)

Simon Garnier, <garnier@njit.edu>

See Also

track

Examples

is_geo

Check if Track Table Uses Geographic Coordinates

Description

Track tables produced by $track_df$ can use a cartesian (x, y, z) or a geographic (latitude, longitude, altitude) coordinate system. This function helps determine which is being used in a particular table.

Usage

```
is_geo(x)
```

Arguments

Χ

A track data table as produced by track_df.

Value

A logical.

Author(s)

Simon Garnier, <garnier@njit.edu>

is_track 11

Examples

```
data(short_tracks)
is_geo(short_tracks)
```

is_track

Check Validity of Track Table

Description

Test whether a variable contains a track table as produced by track_df, track_tbl, or track_dt.

Usage

```
is_track(x)
```

Arguments

Х

An object to test.

Value

A logical indicating whether the variable contains a track table (TRUE) or not (FALSE).

Author(s)

```
Simon Garnier, <garnier@njit.edu>
```

See Also

```
track_df, track_tbl, track_dt
```

Examples

```
data(short_tracks)
is_track(short_tracks)
```

12 missing_data

mп	SS	1	ng	_da	ta

Find Missing Data in a Track Table

Description

This function attempts to automatically detect missing data (for instance due to writing errors) in track tables.

Usage

```
missing_data(x, begin = NULL, end = NULL, step = NULL)
```

Arguments

X	A track table as produced by the track function.
begin	A full time stamp (date+time) in POSIXct format corresponding to the time from which the missing data should be looked for. If not set, the first time stamp of the track table will be used.
end	A full time stamp (date+time) in POSIXct format corresponding to the time until which the missing data should be looked for. If not set, the last time stamp of the track table will be used.
step	A difftime object representing the expected time between two consecutive locations of the trajectory. If not set, it is set to the most common time difference

between successive locations in x.

Value

A track table of all observations with missing data. The missing data is indicated with NA.

Author(s)

Simon Garnier, <garnier@njit.edu>

See Also

track

Examples

n_dims

 n_dims

Number of Spatial Dimensions of a Track Table

Description

Track tables produced by $track_df$ can have 2(x,y) or 3(x, y, z) spatial dimensions. This function returns the number of spatial dimensions of a track table.

Usage

```
n_dims(x)
```

Arguments

Х

A track data table as produced by track_df.

Value

A numeric value.

Author(s)

Simon Garnier, <garnier@njit.edu>

Examples

```
data(short_tracks)
n_dims(short_tracks)
```

n_tracks

Number of Tracks in a Track Table

Description

Track tables produced by track_df can contain multiple tracks (e.g., from different animals). This function returns the number of tracks in a track table.

Usage

```
n_tracks(x)
```

Arguments

Χ

A track data table as produced by track_df.

14 projection

Value

A numeric value.

Author(s)

Simon Garnier, <garnier@njit.edu>

Examples

```
data(short_tracks)
n_tracks(short_tracks)
```

projection

Access/Modify the Projection of a Track Table

Description

Functions to access or modify the projection of a data table. Changing the projection will trigger automatically the conversion of the locations in the new coordinate system.

Usage

```
projection(x)
projection(x) <- value
project(x, value)</pre>
```

Arguments

x A track table.

value A character string or a terra::crs object representing the projection of the

coordinates. "+proj=longlat" is suitable for the outputs of most GPS trackers.

Value

A track table.

Note

It is not possible to modify the projection if missing coordinates are present.

Author(s)

```
Simon Garnier, <garnier@njit.edu>
```

short_tracks 15

See Also

```
st_crs
```

Examples

```
data(short_tracks)
projection(short_tracks)
tracks_projected <- project(short_tracks, "+proj=somerc")
projection(tracks_projected)
projection(tracks_projected) <- "+proj=longlat"
projection(tracks_projected)</pre>
```

short_tracks

Trajectories of Two Goats Through the Namibian Desert (short version)

Description

A dataset containing the trajectories of two goats through the Namibian desert.

Usage

```
short_tracks
```

Format

A track table with 18 rows and 4 variables:

- id Identity of the goat
- t Time of the observation
- x Longitude
- y Latitude

16 track_

tracks

Trajectories of Two Goats Through the Namibian Desert

Description

A dataset containing the trajectories of two goats through the Namibian desert.

Usage

tracks

Format

A track table with 7194 rows and 4 variables:

- id Identity of the goat
- t Time of the observation
- x Longitude
- y Latitude

track_

Build a Track Table

Description

track constructs track tables based on data.frame (the default), tibble, or data.table. track is a convenience function that executes track_df, track_tbl, or track_dt based on the value of the 'table' parameter. Track tables can be used like the data structure they are build upon but with a notable difference: they have an extra attribute to store the projection of the track coordinates, and modifying the projection will automatically trigger the appropriate conversion of the coordinates.

Usage

```
track(x, y, z, t, id, ..., proj, origin, period, tz, format, table = "df")
track_df(x, y, z, t, id, ..., proj, origin, period, tz, format)
track_tbl(x, y, z, t, id, ..., proj, origin, period, tz, format)
track_dt(x, y, z, t, id, ..., proj, origin, period, tz, format)
```

track_

Arguments

x, y, z	Numeric vectors representing the coordinates of the locations. x and y are required. z can be ignored if the trajectories are 2-dimensional. Note: if the vectors are not of the same length, the shorter ones will be recycled to match the length of the longer one.
t	A numeric vector or a vector of objects that can be coerced to date-time objects by as_datetime representing the times (or frames) at which each location was recorded. If numeric, the origin and period of the time points can be set using origin and period below.
id	A vector that can be coerced to a character vector by as.character representing the identity of the individual to which each location belong.
	A set of name-value pairs. Arguments are evaluated sequentially, so you can refer to previously created elements. These arguments are processed with rlang::quos() and support unquote via!! and unquote-splice via!!!. Use := to create columns that start with a dot.
proj	A character string or a crs object (see st_crs for more information) representing the projection of the coordinates. Leave empty if the coordinates are not projected (e.g., output of video tracking). "+proj=longlat" is suitable for the output of most GPS trackers.
origin	Something that can be coerced to a date-time object by as_datetime representing the start date and time of the observations when t is a numeric vector.
period	A character vector in a shorthand format (e.g. "1 second") or ISO 8601 specification. This is used when t is a numeric vector to represent time unit of the observations. All unambiguous name units and abbreviations are supported, "m" stands for months, "M" for minutes unless ISO 8601 "P" modifier is present (see examples). Fractional units are supported but the fractional part is always converted to seconds. See period for more details.
tz	A time zone name. See OlsonNames.
format	A character string indicating the formatting of 't'. See strptime for how to specify this parameter.
	When supplied parsing is performed by strptime(). For this reason consider using specialized parsing functions in lubridate.
table	A string indicating the class of the table on which the track table should be built. It can be a data.frame ("df", the default), a tibble ("tbl"), or a data.table ("dt").

Value

A track table, which is a colloquial term for an object of class track.

Author(s)

Simon Garnier, <garnier@njit.edu>

18 [.track

Examples

```
data(short_tracks)
t_df <- track(x = short_tracks$x, y = short_tracks$y, t = short_tracks$t,</pre>
  id = short_tracks$id, proj = "+proj=longlat", tz = "Africa/Windhoek", table = "df")
t_df <- track_df(x = short_tracks$x, y = short_tracks$y, t = short_tracks$t,</pre>
  id = short_tracks$id, proj = "+proj=longlat", tz = "Africa/Windhoek")
t_tbl <- track_tbl(x = short_tracks$x, y = short_tracks$y, t = short_tracks$t,
id = short_tracks$id, proj = "+proj=longlat", tz = "Africa/Windhoek")
t_dt <- track_dt(x = short_tracks$x, y = short_tracks$y, t = short_tracks$t,</pre>
  id = short_tracks$id, proj = "+proj=longlat", tz = "Africa/Windhoek")
```

[.track

Extract or Replace Parts of a Track Table

Description

Accessing columns, rows, or cells via \$, [[, or [is mostly similar to regular data frames. However, the behavior is sometimes different for track tables based on tibble and data.table. For more info, refer to tibble's and data. table's subsetting documentation.

Usage

```
## S3 method for class 'track'
x[...]
## S3 replacement method for class 'track'
x[...] \leftarrow value
```

Arguments

A track table. Х

Other parameters to be passed to the extracting/subsetting functions of data. frame,

tibble, and data. table.

A suitable replacement value: it will be repeated a whole number of times if value

necessary and it may be coerced: see the 'Coercion' section in data.frame. If

'NULL', deletes the column if a single column is selected.

Value

A subset of the track table is [is called, or a modified version of the track table if [<- is called.
