Package 'tangram'

January 26, 2023

Title The Grammar of Tables

Version 0.8.2

Description Provides an extensible formula system to quickly and easily create production quality tables. The processing steps are a formula parser, statistical content generation from data as defined by formula, followed by rendering into a table. Each step of the processing is separate and user definable thus creating a set of composable building blocks for highly customizable table generation. A user is not limited by any of the choices of the package creator other than the formula grammar. For example, one could chose to add a different S3 rendering function and output a format not provided in the default package, or possibly one would rather have Gini coefficients for their statistical content in a resulting table. Routines to achieve New England Journal of Medicine style, Lancet style and Hmisc::summaryM() statistics are provided. The package contains rendering for HTML5, Rmarkdown and an indexing format for use in tracing and tracking are provided.

Author Shawn Garbett [aut, cre],

Thomas Stewart [ctb], Jennifer Thompson [ctb], Frank Harrell [ctb], Ahra Kim [ctb]

Maintainer Shawn Garbett < Shawn. Garbett@vumc.org>

Depends R (>= 3.5.0), R6, magrittr, knitr

License GPL-3 Encoding UTF-8

LazyData true

Suggests testthat, rms, rmarkdown, Hmisc, sandwich, dplyr, Matching, epitools

Imports stringi, stringr, base64enc, digest, htmltools

+.tangram

Provide a "+" operator for rbind of tangram tables

Description

The plus operator provides an rbind for tangram tables

Usage

```
## S3 method for class 'tangram' x + y
```

Arguments

x left argument for rbindy right argument for rbind

Value

A row wise merged tangram object

add_footnote 5

add_footnote	Add a footnote to a table
--------------	---------------------------

Description

Add a footnote to a table

Usage

```
add_footnote(table, footnote)
```

Arguments

table tangram; the tangram table to modify

footnote character; The footnote to add

Value

the modified table

add_indent Add indentations to left column row headers	
--	--

Description

Add indentations to left column row headers. Note: will only work on cell_header cells.

Usage

```
add_indent(table, amounts = 2, rows = NULL, columns = NULL)
```

Arguments

table Output of tangram::tangram()

amounts numeric; Specifies number of spaces to add. A vector that is either a single value

or vector of the same size as the height of the table. If positions is specified then it must be the same length. Defaults to 2, which each pair of spaces converts

naturally in rendering to HTML, LaTeX, etc..

rows numeric; A vector of numeric row numbers for the rows that need to be indented.

Defaults to NULL which indents all.

columns numeric; Column to apply indent to, defaults to 1

Value

the modified table

6 as.categorical

Examples

```
x <- tangram(drug ~ bili + albumin, pbc)
add_indent(x)
add_indent(x, amounts=10)
add_indent(x, amounts=c(0, 0, 2, 4))
add_indent(x, rows=c(3))
add_indent(x, rows=c(3, 4), amounts=c(4, 2))</pre>
```

 $args_flatten$

Flatten variable arguments

Description

Take variable arguments, flatten vectors and lists, but do not flatten cells (which are lists) e.g. $args_flatten(NA, list(1,2,3), 4:6, c(7,8,9))$

Usage

```
args_flatten(...)
```

Arguments

... variable arguments

Value

a list of the arguments, with vectors and lists flattened

as.categorical

Convert data type to a factor if it's not already

Description

Convert data type to a factor if it's not already

Usage

```
as.categorical(x)
```

Arguments

Х

Data to convert to factor

Value

Data as a factor

ASTBranch 7

Examples

```
as.categorical(1:3)
```

ASTBranch

A left/right branch in an Abstract Syntrax Tree. This inherits from ASTNode, and is intended to be a base class as well. Should never be instantiated directly as once again the semantic information is contained in the class name.

Description

A left/right branch in an Abstract Syntrax Tree. This inherits from ASTNode, and is intended to be a base class as well. Should never be instantiated directly as once again the semantic information is contained in the class name.

A left/right branch in an Abstract Syntrax Tree. This inherits from ASTNode, and is intended to be a base class as well. Should never be instantiated directly as once again the semantic information is contained in the class name.

Format

R6Class object.

Super class

```
tangram::ASTNode -> ASTBranch
```

Public fields

left A pointer to the left node below this one right A pointer to the right node below this one

Methods

Public methods:

- ASTBranch\$distribute()
- ASTBranch\$reduce()
- ASTBranch\$clone()

Method distribute(): Call to distribute multiplication nodes, just recursively calls left and right node distribute functions

Usage:

ASTBranch\$distribute()

Method reduce(): Attached data to nodes by processing data.frame appropriatly. Recursively calls left and right nodes to reduces on data.frame

8 ASTFunction

```
Usage:
ASTBranch$reduce(df)
Arguments:
df (data.frame) Data frame to reduce over

Method clone(): The objects of this class are cloneable with this method.
Usage:
ASTBranch$clone(deep = FALSE)
Arguments:
```

ASTFunction

A specified function call as an ASTNode

Description

A specified function call as an ASTNode A specified function call as an ASTNode

deep Whether to make a deep clone.

Format

R6Class object.

Super class

```
tangram::ASTNode -> ASTFunction
```

Public fields

r_expr A string containing the raw r expression from inside the parenthesis data Data stored as a result of reduction

Methods

Public methods:

- ASTFunction\$new()
- ASTFunction\$factors()
- ASTFunction\$name()
- ASTFunction\$string()
- ASTFunction\$reduce()
- ASTFunction\$clone()

Method new(): Construct a node representing a function call

Usage:

ASTFunction 9

```
ASTFunction$new(value, r_expr)
 Arguments:
 value (character) The name of the function call
 r_expr Any r expression to be evaluated inside the call
Method factors(): Returns all terminal nodes, this is a terminal node so returns self
 ASTFunction$factors()
Method name(): Returns the function call as character
 Usage:
 ASTFunction$name()
Method string(): Returns a re-parsable representation of the node
 Usage:
 ASTFunction$string()
Method reduce(): Given a data.frame execute the function in that environment and associate
the result as data.
 Usage:
 ASTFunction$reduce(data)
 Arguments:
 data (data.frame) The data.frame to use as the environment for the function execution
Method clone(): The objects of this class are cloneable with this method.
 Usage:
 ASTFunction$clone(deep = FALSE)
 Arguments:
 deep Whether to make a deep clone.
```

Examples

```
ASTFunction$new("log", "x+2")$string()
```

10 ASTMultiply

ASTMultiply

The multiplication of two terms, as an ASTNode.

Description

The multiplication of two terms, as an ASTNode.

The multiplication of two terms, as an ASTNode.

Format

R6Class object.

Super classes

```
tangram::ASTNode -> tangram::ASTBranch -> ASTMultiply
```

Public fields

```
left The AST tree to the left.right The AST tree to the right.type The specified type of this node
```

Methods

Public methods:

- ASTMultiply\$new()
- ASTMultiply\$distribute()
- ASTMultiply\$factors()
- ASTMultiply\$string()
- ASTMultiply\$clone()

Method new(): Construct a multiplication node

```
Usage:
```

```
ASTMultiply$new(left, right)
```

Arguments:

left (ASTNode) nodes to the left of the multiplication right (ASTNode) nodes to the right of the multiplication

Method distribute(): Rearrange nodes distribution multiplication across parenthesis

Usage:

ASTMultiply\$distribute()

Method factors(): return all terminal nodes on left and right

Usage:

ASTNode 11

```
ASTMultiply$factors()

Method string(): Return a re-parseable string
    Usage:
    ASTMultiply$string()

Method clone(): The objects of this class are cloneable with this method.
    Usage:
    ASTMultiply$clone(deep = FALSE)
    Arguments:
    deep Whether to make a deep clone.
```

Examples

 $ASTMultiply new(ASTVariable new("x"), \ ASTVariable new("y")) \$string()$

ASTNode

A Node in an Abstract Syntax Tree (AST)

Description

A Node in an Abstract Syntax Tree (AST)

A Node in an Abstract Syntax Tree (AST)

Details

This is the root R6 class of any term of the AST which is created when parsing a table formula. This should only be used as a base class as the class information carries the semantic meaning of a given node.

Public fields

format Any formatting directive passed to this node.

value A string of additional information contained by the node.

Methods

Public methods:

- ASTNode\$terms()
- ASTNode\$distribute()
- ASTNode\$string()
- ASTNode\$reduce()
- ASTNode\$set_format()
- ASTNode\$clone()

12 ASTPlus

```
Method terms(): Returns this node
 Usage:
 ASTNode$terms()
Method distribute(): Distributes data across multiplications and rearranges nodes
 Usage:
 ASTNode$distribute()
Method string(): Returns string representation of node
 Usage:
 ASTNode$string()
Method reduce(): Given a set of data, associates it with AST nodes
 Usage:
 ASTNode$reduce(data)
 Arguments:
 data (data.frame) data to associate across nodes
Method set_format(): Override the formatting directive for this node
 Usage:
 ASTNode$set_format(x)
 Arguments:
 x (numeric, character) the formatting directive
Method clone(): The objects of this class are cloneable with this method.
 Usage:
 ASTNode$clone(deep = FALSE)
 Arguments:
 deep Whether to make a deep clone.
```

ASTPlus

The addition of two terms, in an ASTNode.

Description

The addition of two terms, in an ASTNode.

The addition of two terms, in an ASTNode.

Format

R6Class object.

ASTPlus 13

Super classes

```
tangram::ASTNode -> tangram::ASTBranch -> ASTPlus
```

Public fields

```
data Just returns the R6 name 'ASTPlus' left The node to the left of this node right The node to the right of this node
```

Methods

Public methods:

- ASTPlus\$new()
- ASTPlus\$terms()
- ASTPlus\$string()
- ASTPlus\$clone()

```
Method new(): Construct a new node that represents addition
```

```
Usage:
ASTPlus$new(left, right)
Arguments:
left (ASTNode) Node on the left side of the addition
right (ASTNode) Node on the right side of the addition
```

Method terms(): Returns a vector of the left and right terms

```
Usage:
```

ASTPlus\$terms()

Method string(): A reparsable string representation of this node.

```
Usage:
```

ASTPlus\$string()

Method clone(): The objects of this class are cloneable with this method.

```
Usage:
```

```
ASTPlus$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

Examples

```
ASTPlus$new(ASTVariable$new("x"), ASTVariable$new("y"))$string()
```

14 ASTTableFormula

ASTTableFormula

The root ASTNode of a formula.

Description

The root ASTNode of a formula. The root ASTNode of a formula.

Format

R6Class object.

Super classes

```
tangram::ASTNode -> tangram::ASTBranch -> ASTTableFormula
```

Public fields

left The AST tree for the columns. right The AST tree for the rows.

Methods

Public methods:

- ASTTableFormula\$new()
- ASTTableFormula\$terms()
- ASTTableFormula\$string()
- ASTTableFormula\$clone()

```
Method new(): Create a new formula node
```

Usage:

ASTTableFormula\$new(left, right)

Arguments:

left The left side of the "~" as an AST right The right side of the "~" as an AST

Method terms(): Returns all terminal nodes from left and right

Usage:

ASTTableFormula\$terms()

Method string(): A re-parseable string representing the AST

Usage:

ASTTableFormula\$string()

Method clone(): The objects of this class are cloneable with this method.

ASTVariable 15

```
Usage:
ASTTableFormula$clone(deep = FALSE)
Arguments:
deep Whether to make a deep clone.
```

Examples

```
ASTTableFormula$new(ASTVariable$new("x"), ASTVariable$new("y"))$string()
```

ASTVariable

A Variable in an Abstract Syntax Tree (AST)

Description

A Variable in an Abstract Syntax Tree (AST)

A Variable in an Abstract Syntax Tree (AST)

Format

R6Class object.

Details

This node represents a variable of interest in the AST. A variable's name is recorded in the value field, and must conform to the rules of identifiers in R. This class inherits from ASTNode.

Methods

```
new(identifier, format=NA, type=NA)
terms() Returns the node
distribute() Applies the distributive property to the node, and returns the resulting node.
string() Returns the string formula of the node
name() Return a human representation of a node
reduce(data) Given a set of data, perform the logical reduction of the current node.
```

Super class

```
tangram::ASTNode -> ASTVariable
```

Public fields

```
data The associated data post reduction type The identified type of this node (defaults: Categorical, Numeric)
```

16 ASTVariable

Methods

```
Public methods:
```

```
• ASTVariable$new()
```

- ASTVariable\$factors()
- ASTVariable\$name()
- ASTVariable\$string()
- ASTVariable\$reduce()
- ASTVariable\$clone()

Method new(): This method creates an AST node representing a variable of a given identifier. An optional format consisting of a string of a number or a c-style printf string. An option type denoting a forced type cast of that variable.

```
Usage:
 ASTVariable$new(identifier, format = NA, type = NA)
 Arguments:
 identifier (character) Variable name
 format (character, numeric) Formatting directive
 type (character) any additional type information
Method factors(): Returns all terminal nodes under this. Since this is a terminal node, returns
self
 Usage:
 ASTVariable$factors()
Method name(): Returns the text name of this node. For an intercept, returns "All"
 Usage:
 ASTVariable$name()
Method string(): Returns name of variable with optional format and type information
 Usage:
 ASTVariable$string()
Method reduce(): Given a data frame, associates correct variable with this node
 Usage:
 ASTVariable$reduce(d)
 Arguments:
 d (data.frame) data.frame to reduce
Method clone(): The objects of this class are cloneable with this method.
 Usage:
 ASTVariable$clone(deep = FALSE)
 Arguments:
 deep Whether to make a deep clone.
```

Examples

```
ASTVariable$new("x", "2", "Continuous")$string()
```

cbind.tangram 17

cbind.tangram

A chind for generated table tangram objects.

Description

Execute the equivalent of an cbind for generated tables

Usage

```
## S3 method for class 'tangram'
cbind(..., deparse.level = 1)
```

Arguments

```
... tangram objects to cbind deparse.level numeric; not used
```

Value

A merged tangram object

cell

Construct a table cell from an object

Description

Any R object can be used as a cell value. Attributes are used to store additional classs of that cell attached to the object. This is a helper function to attach all the additional attributes to the provided object

Usage

```
cell(x, ...)
```

Arguments

x R object to attach attributes too

Each additional argument becomes an attribute for the object

Details

Certain attributes have special meaning: - 'names' is appended to the front of a value, e.g. "P=" for a p-value. - 'sep' is used to join values, e.g. ", " for a list of values. - 'class' denotes special rendering handling, e.g. generally passed as CSS class to HTML5 - 'reference' a list of reference symbols to put inside the cell - 'row' and 'col' should refer to the row / column if key generation is needed - 'subrow' and 'subcol' further delinate the key value of a cell for key generation

18 cell_label

Value

The modified R object

cell_header

Create a cell_header object of the given text.

Description

A cell_header object represents a label cell inside a table. It can also contain units.

Usage

```
cell_header(text, units = NULL, class = NULL, ...)
```

Arguments

character; The text of the label. May include a subset of LaTeX greek or math.

character; An optional field that contains units

character; An optional field for additional S3 classes (e.g. could be used in html rendering for CSS)

optional extra information to attach

Value

A cell_header object

Examples

```
cell_header("Yahoo")
cell_header("Concentration", "mg/dl")
cell_header("Concentration", "mg/dl", src="A")
```

cell_label

Create an cell_label (S3) object of the given text.

Description

A cell_label object represents a label cell inside a table. It can also contain units.

Usage

```
cell_label(text, units = NULL, class = NULL, ...)
```

cell_n

Arguments

text	character; The text of the label. May include a subset of LaTeX greek or math.
units	character; An optional field that contains units
class	character; An optional field for additional S3 classes (e.g. could be used in html rendering for CSS)
	optional extra information to attach

Value

A tangram object

Examples

```
cell_label("Compaction Method")
cell_label("Concentration", "mg/dl")
cell_label("Concentration", "mg/dl", subcol="A")
```

cell_n

Create an cell_n (S3) object of the given statistic

Description

A cell_n object contains an n value. Essentially, this is just a helper that appends the cell_n class to the given object and makes sure it's a cell S3 object as well.

Usage

```
cell_n(n, class = NULL, hdr = FALSE, possible = NULL, ...)
```

Arguments

hdr

n The numerical value
class character; An optional field for additional S3 classes (e.g. could be used in html rendering for CSS)

logical; Construct an n value for a header (defaults to FALSE)

possible numerical; The total N that was possible ... optional extra information to attach

Value

A cell_n object.

Examples

```
cell_n(20)
```

20 cell_transform

cell_subheader

Description

A cell_subheader object represents a label cell inside a table. It can also contain units.

Usage

```
cell_subheader(text, units = NULL, class = NULL, ...)
```

Arguments

```
    character; The text of the label. May include a subset of LaTeX greek or math.
    character; An optional field that contains units
    class
    character; An optional field for additional S3 classes (e.g. could be used in html rendering for CSS)
    optional extra information to attach
```

Value

A cell_subheader object.

Examples

```
cell_subheader("Concentration")
cell_subheader("Concentration", "mg/dl")
cell_subheader("Concentration", "mg/dl", src="A")
```

cell_transform

Create a function to transform all cells of a table

Description

Given a function that operates on a table cell and returns the modified cell, return a function that given a table applies that function to all cells and returns the modified table.

Usage

```
cell_transform(FUN, ...)
```

Arguments

FUN function to apply, must return the modified cell ... additional arguments to pass into function

col_header 21

Value

a table modification function

col_header

A set of magrittr operators for tangram tables

Description

A set of magrittr operators for tangram tables

Usage

```
col_header(table, ..., sub = TRUE)
row_header(table, ..., sub = TRUE)
write_cell(table, x, ...)
home(table)
cursor_up(table, n = 1)
cursor_down(table, n = 1)
cursor_left(table, n = 1)
cursor\_right(table, n = 1)
cursor_pos(table, nrow, ncol)
carriage_return(table)
line_feed(table, n = 1)
new_line(table)
new_row(table)
new_col(table)
table_apply(table, x, FUN, ...)
add_col(table, ...)
add_row(table, ...)
```

22 csv

```
set_footnote(table, footnote)
set_id(table, id)
set_caption(table, caption)
set_style(table, style)
set_colspan(table, span)
set_rowspan(table, span)
```

Arguments

table	tangram; The tangram table being built
	additional argument passed
sub	logical; Is this a subheader
X	object of focus in operation
n	numeric; number of times to perform operation
nrow	numeric; number of rows
ncol	numeric; number of columns
FUN	function; function to apply
footnote	character; footnote to add
id	character; id of table
caption	character; caption of table
style	character; styling in compiling table and in rendering
span	numeric; number of rows or columns to span

 CSV

Generate an csv from a tangram or cell object

Description

Given a tangram object create an index representation.

Usage

```
csv(object, ...)
## S3 method for class 'tangram'
csv(object, file = NULL, sep = ",", ...)
## Default S3 method:
csv(object, ...)
```

custom_css 23

Arguments

object The cell header to render to HTML5

... additional arguments to renderer. Unused

file File to write result into

sep separator to use

Value

A string containing the csv file

custom_css

Return a CSS file as a string

Description

Given a filename, this function will load the file name from the current working directory. If it is not found from the current working directory it will search in the package for a a matching filename and load that instead. If an id is specified, that will be prepended to all CSS selectors (TODO: make this substitution more robust). The result is returned as a string.

Usage

```
custom_css(filename, id = NA)
```

Arguments

filename Name of the CSS file to load id CSS id to prepend to all entries

Value

String of possibly modified CSS file

Examples

```
custom_css("lancet.css", "tbl1")
```

24 del_row

del_col

Delete given column(s) from a table

Description

Given a table, remove the specified column

Usage

```
del_col(table, col)
```

Arguments

table the table to modify

col vector containing column(s) to drop

Value

the modified table

del_row

Delete a row(s) from a table

Description

Given a table, remove the specified row

Usage

```
del_row(table, row)
```

Arguments

table the table to modify

row vector with row numbers to drop

Value

the modified table

derive_label 25

derive_label

Derive label of AST node.

Description

Determine the label of a given AST node. NOTE: Should have data attached via reduce before calling.

Usage

```
derive_label(node, capture_units = FALSE, ...)
```

Arguments

node Abstract syntax tree node.

capture_units logical; Capture units from parenthesis ending a label

... Other arguments, ignored

Value

A string with a label for the node

drop_statistics

Drop all statistics columns from a table.

Description

Delete from a table all columns that contain statistics

Usage

```
drop_statistics(table)
```

Arguments

table

the table to remove statistical columns

Value

the modified table

26 hmisc_data_type

format_guess

Guess the best format for a given set of numerical data

Description

Given a vector of data, default to 3 significant digits or all if maximum is greater than zero

Usage

```
format_guess(x)
```

Arguments

Х

numeric; basic math and quantile function must work on data passed in

Value

numeric; the digits past the decimal recommended for display

Examples

```
format_guess(rnorm(100))
format_guess(rnorm(100, sd=1e-6))
```

hmisc_data_type

Determine data type of a vector loosely consistent with Hmisc.

Description

Determine data type of a vector loosely consistent with Hmisc.

Usage

```
hmisc_data_type(x, category_threshold = NA)
```

Arguments

x Vector to determine type of

category_threshold

The upper threshold of unique values for which a vector is considered categorical.

Value

One of the following strings: Binomial, Categorical, or Numerical.

See Also

hmisc

Examples

```
hmisc_data_type(c(1,2,3))
hmisc_data_type(factor(c("A","B","C")))
hmisc_data_type(factor(c("A","B","B","A")))
hmisc_data_type(factor(c(TRUE, FALSE, TRUE, FALSE)))
```

hmisc_intercept_cleanup

Cleanup an intercept only model

Description

Cleanup an intercept only table that was generated from the hmisc default transform. This drops the statistics column, and modifies the header to eliminate blank space.

Usage

```
hmisc_intercept_cleanup(table)
```

Arguments

table

the table to modify

Value

the modified table

hmisc_p

Cell Generation functions for hmisc default

Description

Each function here is called when a cell is generated. Overriding these in a formula call will allows one to customize exactly how each cell's contents are generated. While this serves as the base template for transforms, it is by no means required if one develops their own bundle of data transforms. One can create ay number of cell level styling choices.

28 hmisc_p

Usage

```
hmisc_p(p, pformat = "%1.3f", include_p = TRUE)
hmisc_iqr(
 х,
 format = NA,
 na.rm = TRUE,
 names = FALSE,
 type = 8,
 msd = FALSE,
 quant = c(0.25, 0.5, 0.75),
)
hmisc_fraction(numerator, denominator, format = 3, ...)
hmisc_fstat(f, df1, df2, p, class = NULL, ...)
hmisc_chi2(chi2, df, p, class = NULL, ...)
hmisc_spearman(S, rho, p, class = NULL, ...)
hmisc_wilcox(V, p, class = NULL, ...)
hmisc_cell
```

Arguments

р	numeric; p-value to format
pformat	numeric or character; Significant digits or fmt to pass to sprintf
include_p	logical; include the leading P on the output string
X	numeric; whose sample quantiles are wanted. NA and NaN values are not allowed in numeric vectors unless na.rm is TRUE.
format	numeric or character; Significant digits or fmt to pass to sprintf
na.rm	logical; if true, any NA and NaN's are removed from x before the quantiles are computed.
names	logical; if true, the result has a names attribute. Set to FALSE for speedup with many probs.
type	integer; specify algorithm to use in constructing quantile. See quantile for more information.
msd	logical; compute an msd attribute containing mean and standard deviation
quant	numeric; The quantiles to display. Should be an odd length vector, since the center value is highlighted.
• • •	additional arguments passed
numerator	numeric; The value of the numerator

hmisc_p

denominator	numeric; The value of the denominator
f	The value of the f-statistic
df1	1st dimension degrees of freedom
df2	2nd dimension degrees of freedom
class	character; An optional field for additional S3 classes (e.g. could be used in html rendering for CSS)
chi2	The value of the X^2 statistic
df	degrees of freedom
S	The value of the spearman statistic
rho	The rho value of the test
V	The value of the Wilcoxon statistic

Format

An object of class list of length 8.

Value

A formatted string or cell as appropriate

hmisc_p

Given a style in number of digits or a sprintf style specifier it renders the p-value and checks to see if it's all zeros, then switches the output to a less than.

hmisc_iqr

Construct a cell which has the interquartile ranges specified.

hmisc_fraction

Construct a cell which has the fraction specified in an hmisc format

hmisc_fstat

Construct a cell which has the fstat specified in an hmisc format.

hmisc_chi2

Construct a cell which has the chi^2 specified in an hmisc format

hmisc_spearman

Construct a cell which has the spearman specified in an hmisc format

hmisc_wilcox

Construct a cell which has the Wilcoxon specified in an hmisc format

30 html5

hmisc_cell

List of data transforms for a cell of a table.

See Also

hmisc

Examples

```
hmisc_p(1e-6)
hmisc_p(0.234)
hmisc_p(1.234e-6, 5)
hmisc_p(1.234e-6, 6)
require(stats)
hmisc_iqr(rnorm(100), '3')
hmisc_fraction(1, 4, 3)
hmisc_fstat(4.0, 10, 20, 0.004039541)
hmisc_chi2(5.33, 6, 0.2)
hmisc_spearman(20, 0.2, 0.05)
hmisc_wilcox(20, 0.2)
```

html5

S3 html5 Method function for use on a tangram to generate HTML5

Description

S3 html5 Method function for use on a tangram to generate HTML5

Usage

```
html5(object, id, ...)
```

Arguments

object	The cell to render to HTML5
id	A unique identifier for traceability in indexing
	additional arguments to renderer.

html5.cell 31

			-	-		-	-	
r	١t	· n	nl	L5		\sim 1	ı	
	ıι	- 11	ш	LJ	•			

Convert an abstract cell object into an HTML5 string

Description

Given a cell class create an HTML5 representation.

Usage

```
## S3 method for class 'cell'
html5(object, id, ..., class = NULL)
```

Arguments

object	The cell to render to HTML5
id	A unique identifier for traceability
	additional arguments to renderer. Unused
class	An additional class attribute for the HTML5 element

Value

A text string rendering of the given cell as a with several 's.

html5.cell_header

Convert an abstract cell_header object into an HTML5 string

Description

Given a cell_header class create an HTML5 representation.

Usage

```
## S3 method for class 'cell_header'
html5(object, id, ..., class = NULL)
```

Arguments

object	The cell subheader to render to HTML5
id	A unique identifier for traceability
	additional arguments to renderer. Unused
class	additional class attributes for CSS rendering

Value

A text string rendering of the given subheader as a with several 's.

32 html5.cell_n

h	+ m	. 7	.cell	1 1 ~	hal
- 11	шш	11:3	. Cer	ı ıa	DH.

Convert a cell_label object into an HTML5 string

Description

Given a cell_label class create an HTML5 representation.

Usage

```
## S3 method for class 'cell_label'
html5(object, id, ..., class = NULL)
```

Arguments

object The cell label to render to HTML5 id A unique identifier for traceability

. . . additional arguments to renderer. Unused

class An additional class attribute for the HTML5 element

Value

A text string rendering of the given label as a with several 's.

html5.cell_n

Convert an abstract cell_n object into an HTML5 string

Description

Given a cell_n class create an HTML5 representation.

Usage

```
## S3 method for class 'cell_n'
html5(object, id, ..., class = NULL)
```

Arguments

object	The cell n to render to HTML5
id	A unique identifier for traceability

... additional arguments to renderer. Unused

class An additional class attribute for the HTML5 element

Value

A text string rendering of the given n as a with several 's.

html5.cell_subheader 33

html5.cell_subheader Convert

Convert an abstract cell_subheader object into an HTML5 string

Description

Given a cell_subheader class create an HTML5 representation.

Usage

```
## S3 method for class 'cell_subheader'
html5(object, id, ..., class = NULL)
```

Arguments

object The cell subheader to render to HTML5
id A unique identifier for traceability
... additional arguments to renderer. Unused
class additional class attributes for CSS rendering

Value

A text string rendering of the given subheader as a with several 's.

html5.character

Default conversion to HTML5 for a character cell

Description

Produces table cell

Usage

```
## S3 method for class 'character'
html5(object, id, ..., class = NA)
```

Arguments

object	The cell to render to HTML5
id	A unique identifier for traceability
	additional arguments to renderer. Unused
class	An additional class attribute for the HTML5 element

Value

An empty html5 td of the given class

34 html5.logical

ı.		7		_	د ـ ا	fа	1	_
r	T.	m	כו	. 0	e	га	u	ΙT

Default conversion to HTML5 for an abstract table element

Description

Gives a warning and produces an empty cell

Usage

```
## Default S3 method:
html5(object, id, ..., class = NA)
```

Arguments

object The cell to render to HTML5
id A unique identifier for traceability
... additional arguments to renderer. Unused

class An additional class attribute for the HTML5 element

Value

An empty html5 td of the given class

html5.logical

Default conversion to HTML5 for a logical cell

Description

Produces table cell or nothing if it's an NA. This is useful for dealing with rowspan and colspan.

Usage

```
## S3 method for class 'logical'
html5(object, id, ..., class = NA)
```

Arguments

object The cell to render to HTML5

id A unique identifier for traceability

... additional arguments to renderer. Unused

class An additional class attribute for the HTML5 element

Value

An empty html5 td of the given class

html5.tangram 35

html5.tangram

Convert a tangram class into an HTML5 string

Description

Given a tangram class, a series of conversion creates an HTML5 representation of the table. It may be an HTML5 fragment or it may be a complete web page.

Usage

```
## S3 method for class 'tangram'
html5(
  object,
  id = NULL,
  caption = NULL,
  fragment = NULL,
  style = NULL,
  footnote = NULL,
  inline = NULL,
  fixed_thead = NULL,
  ...
)
```

Arguments

object	The cell table to render to HTML5
id	A unique identifier for the table (strongly recommended). If not provided, caption will be used.
caption	A string caption for the table
fragment	A boolean flag that determines whether a fragment or a complete HTML5 document is generatedf
style	A string containing a style filename to include as inline CSS. It first searches the drive for the file, if that fails it looks inside the package for a matching css file.
footnote	Any footnotes to include under the table.
inline	DEPRECATED
fixed_thead	logical; fixes the header using position sticky in CSS defaults to FALSE
	additional arguments to renderer. Unused

Details

The package includes several css files for styling. At present the following exist: 'hmisc.css', 'lancet.css', 'lancet-stripped.css' and 'nejm.css'

Value

A text string rendering of the given table in HTML5

index.cell_label

index

Generate an index from a tangram or cell object

Description

Given a tangram object create an index representation.

Usage

```
index(object, ...)
```

Arguments

object The cell header to render to HTML5
... additional arguments to renderer. Unused

Value

A matrix or list of strings containing key, source and value

index.cell_label

Generate an index from a label object

Description

Overrides to generate no indexing on labels

Usage

```
## S3 method for class 'cell_label'
index(object, id = "tangram", key.len = 4, ...)
```

Arguments

object cell; The cell for indexing

id character; an additional specifier for the object key

key.len numeric; length of key to generate

... additional arguments to renderer. Unused

Value

A list of strings containing key, source and value

index.default 37

index.default	Generate an index f	rom a cell object

Description

Given a cell class create an index representation. If no source is specified no index will be generated.

Usage

```
## Default S3 method:
index(object, id = "tangram", name = NULL, key.len = 4, ...)
```

Arguments

object cell; The cell for indexing

id character; an additional specifier for the object key name character; optional names of elements inside object

key.len numeric; length of generated key

... additional arguments to renderer. Unused

Value

A list of strings containing key, source and value

index.list Generate an index from a list object

Description

Given a cell class create an index representation. If no source is specified no index will be generated.

Usage

```
## S3 method for class 'list'
index(object, id = "tangram", key.len = 4, ...)
```

Arguments

object cell; The cell for indexing

id character; an additional specifier for the object key

key.len numeric; length of key to generate

... additional arguments to renderer. Unused

Value

A list of strings containing key, source and value

38 insert_column

index.tangram

Generate an an index from a tangram object

Description

Given a tangram class create an index representation.

Usage

```
## S3 method for class 'tangram'
index(object, id = "tangram", key.len = 4, ...)
```

Arguments

object The tangram for indexing

id an additional specifier for the object key

key.len numeric; length of keys generated (affects collision probability)

... additional arguments to renderer. Unused

Value

A matrix of strings containing key, source and value

insert_column

Insert a column into a tangram table

Description

Insert a column into a tangram table. Will fill with empty cells is not enough cells are specified.

Usage

```
insert_column(table, after, ..., class = NULL)
```

Arguments

table the table to modify

after numeric; The column to position the new row after. Can be zero for inserting a

new first row.

... Table cells to insert. Cannot be larger than existing table. class character; Classes to apply as directives to renderers

Value

the modified table

insert_row 39

insert_row	Insert a row into a tangram table
------------	-----------------------------------

Description

Insert a row into a tangram table. Will fill with empty cells is not enough cells are specified.

Usage

```
insert_row(table, after, ..., class = NULL)
```

Arguments

table the table to modify

after numeric; The row to position the new row after. Can be zero for inserting a new

first row.

... Table cells to insert. Cannot be larger than existing table.

class character; Classes to apply as directives to renderers

Value

the modified table

is.binomial Determine if a vector is binomial or not

Description

Determine if a vector is binomial or not

Usage

```
is.binomial(x, threshold = NA)
```

Arguments

x Vector to determine type of

threshold The upper threshold of unique values for which a vector is considered categori-

cal.

Value

a Boolean: TRUE / FALSE

40 is.categorical

Examples

```
is.binomial(c(1,2,3))
is.binomial(factor(c("A","B","C")))
is.binomial(factor(c("A","B","B","A")))
is.binomial(factor(c(TRUE, FALSE, TRUE, FALSE)))
is.binomial(c('M', 'F', 'M', 'F'), 10)
```

is.categorical

Determine if a vector is categorical or not

Description

Determine if a vector is categorical or not

Usage

```
is.categorical(x, threshold = NA)
```

Arguments

x Vector to determine type of

threshold The upper threshold of unique values for which a vector is considered categori-

cal.

Value

A Boolean: TRUE / FALSE

Examples

```
is.categorical(c(1,2,3))
is.categorical(c(rep(1,20), rep(2, 20), rep(3, 20)), threshold=5)
is.categorical(c("A","B","B"))
is.categorical(factor(c("A","B","C")))
is.categorical(factor(c("A","B","B","A")))
is.categorical(factor(c(TRUE, FALSE, TRUE, FALSE)))
```

key 41

key

Key derivation helper function

Description

This function should generate a string that uniquely identifies a piece of data present in a table. In a report with multiple tables the id is used to preserve uniqueness.

Usage

```
key(x, id)
```

Arguments

x cell object to derive key for

id the unique id of the table being keyed

Details

This function relies on the object being keyed having at a minimum character attributes for row and col. Additional specifies for embedded tables are given with subrow and subcol. The row and col are automatically appended when using a table_builder. However the subrow and subcol must be added by the user to a cell of a table.

lancet

Style Bundle for Lancet style

Description

List of lists, should contain a "Type" entry with a function to determine type of vector passed in. Next entries are keyed off returned types from function, and represent the type of a row. The returned list should contain the same list of types, and represents the type of a column. Thus it now returns a function to process the intersection of those two types.

Usage

lancet

Format

An object of class list of length 5.

42 lancet_fraction

lancet_cell

Cell Generation functions for Lancet styling

Description

Each function here is called when a cell is generated. Overriding these in a formula call will allows one to customize exactly how each cell's contents are generated.

Usage

```
lancet_cell
```

Format

An object of class list of length 8.

lancet_fraction

Create an cell_fraction (S3) in NEJM style of the given data

Description

A cell object contains a statistical result of a fraction/percentage in nejm style

Usage

```
lancet_fraction(numerator, denominator, format = NULL, ...)
```

Arguments

```
numerator numeric; The value of the numerator denominator numeric; The value of the denominator
```

format numeric or character; a string formatting directive

... optional extra information to attach

Value

A cell_fraction object.

Examples

```
lancet_fraction(1, 4, 3)
```

lancet_mean_sd 43

lancet_mean_sd

Create a mean/sd cell object of the given data in Lancet style

Description

Create a mean/sd cell object of the given data in Lancet style.

Usage

```
lancet_mean_sd(
    x,
    format = NA,
    na.rm = TRUE,
    names = FALSE,
    type = 8,
    msd = FALSE,
    quant = c(0.25, 0.5, 0.75),
    ...
)
```

Arguments

Х	numeric vector whose sample quantiles are wanted. NA and NaN values are not allowed in numeric vectors unless na.rm is TRUE.
format	numeric or character; Significant digits or fmt to pass to sprintf
na.rm	logical; if true, any NA and NaN's are removed from x before the quantiles are computed.
names	logical; ignored. For compatibility with hmisc_iqr
type	integer; ignored. For compatibility with hmisc_iqr
msd	logical; ignored. For compatibility with hmisc_iqr
quant	numeric; ignored. For compatibility with hmisc_iqr
	additional arguments to constructing cell

Value

A cell object.

Examples

```
require(stats)
lancet_mean_sd(rnorm(100), '3')
```

44 latex

latex

Render to LaTeX methods for tangram cell objects

Description

Each of these methods will render the cell object as a LaTeX fragment

Usage

```
latex(object, ...)
## Default S3 method:
latex(object, ...)
## S3 method for class 'cell'
latex(object, na.blank = TRUE, ...)
## S3 method for class 'cell_label'
latex(object, ...)
## S3 method for class 'logical'
latex(object, ...)
## S3 method for class 'cell_header'
latex(object, ...)
## S3 method for class 'cell_subheader'
latex(object, ...)
## S3 method for class 'tangram'
latex(object, fragment = TRUE, filename = NULL, append = FALSE, ...)
```

Arguments

object	object; the item to render to latex
	additional arguments
na.blank	logical; Dispaly NAs as blanks.
fragment	logical; Is this a complete LaTeX document or just the table fragment
filename	character; filename to write LaTex into
append	logical; Should the write be an append operation or overwrite

Details

There are addition arguments possible to control the rendering, but due to some oddities between CRAN requirements and how R handles defaults (for full details see the source code) they are as follows

latexify 45

- * cgroup.just character; The text of the column justification used in the table
- * arraystretch numeric; The arraystretch parameter used for vertical spacing
- * style character; can be null or "nejm" for different table styling
- * rel_size numeric; a scaling to be applied to the entire table, e.g. rel_size=-2
- * placement character; placement directive, defaults to "H"

Value

the LaTeX rendering

Examples

```
latex(cell_label("123"))
latex(hmisc_iqr(rnorm(20)))
latex(hmisc_fraction(45, 137))
tbl <- tangram(drug~bili, pbc, "tbl")
latex(tbl)</pre>
```

latexify

LaTeX safe string conversion

Description

LaTeX safe string conversion. This transforms a string handling Markdown characters and UNI-CODE as best it can with an automated pass.

Usage

```
latexify(x)
```

Arguments

Χ

string to make LaTeX safe

Value

valid LaTeX code

nejm

latex_template

Return a LaTeX template that works with tangram

Description

Pandoc in the current version of RStudio does not allow for setting package options to xcolor and this has made it incompatible with the LaTeX generated by this package. This provides a known working template.

Usage

```
latex_template()
```

Details

An example header would look like the following:

— title: "A Document Full of Beautiful Tables" output: pdf_document: "'r tangram::latex_template()'"

Value

filename of LaTeX template

nejm

Style Bundle for Closer to NEJM style

Description

List of lists, should contain a "Type" entry with a function to determine type of vector passed in. Next entries are keyed off returned types from function, and represent the type of a row. The returned list should contain the same list of types, and represents the type of a column. Thus it now returns a function to process the intersection of those two types.

Usage

nejm

Format

An object of class list of length 5.

nejm_cell 47

nejm_cell

Cell Generation functions for nejm default

Description

Each function here is called when a cell is generated. Overriding these in a formula call will allows one to customize exactly how each cell's contents are generated.

Usage

```
nejm_cell
```

Format

An object of class list of length 9.

Details

While this serves as the base template for transforms, it is by no means required if one develops their own bundle of data transforms. One can create ay number of cell level styling choices.

nejm_fraction

Create an cell_fraction (S3) in NEJM style of the given data

Description

A cell object contains a statistical result of a fraction/percentage in nejm style

Usage

```
nejm_fraction(numerator, denominator, format = NULL, ...)
```

Arguments

numerator numeric; The value of the numerator denominator numeric; The value of the denominator

format numeric or character; a string formatting directive

... optional extra information to attach

Value

A cell_fraction object.

Examples

```
nejm_fraction(1, 4, 3)
```

nejm_iqr

ne		

Create a interquartile range cell object of the given data NEJM style

Description

Construct a cell which has the 3 interquartile ranges specified.

Usage

```
nejm_iqr(
    x,
    format = NA,
    na.rm = TRUE,
    names = FALSE,
    type = 8,
    msd = FALSE,
    quant = c(0.25, 0.5, 0.75),
    ...
)
```

Arguments

X	numeric vector whose sample quantiles are wanted. NA and NaN values are not allowed in numeric vectors unless na.rm is TRUE.
format	numeric or character; Significant digits or fmt to pass to sprintf
na.rm	logical; if true, any NA and NaN's are removed from x before the quantiles are computed.
names	logical; if true, the result has a names attribute. Set to FALSE for speedup with many probs.
type	integer; specify algorithm to use in constructing quantile. See quantile for more information.
msd	logical; compute an msd attribute containing mean and standard deviation
quant	numeric; The quantiles to display. Should be an odd length vector, since the center value is highlighted.
• • •	additional arguments to constructing cell

Value

A cell_quantile object.

Examples

```
require(stats)
nejm_iqr(rnorm(100), '3')
```

nejm_range 49

neım	range

Create a NEJM style range

Description

Construct a cell which has the range of the given data in NEJM style

Usage

```
nejm_range(x, format, ...)
```

Arguments

x numeric vector whose range is desired	
---	--

format numeric or character; an argument to pass to the formatting function

additional arguments to passed to cell()

Parser The parser class for generating abstract syntax trees for given table formulas.

Description

The parser class for generating abstract syntax trees for given table formulas.

The parser class for generating abstract syntax trees for given table formulas.

Format

R6Class object.

References

Aho, A. V., Lam, M. S., Sethi, R., and Ullman, J. D. (2006) *Compilers: Principles, Techniques, and Tools*, 2nd edition. Addison Wesley.

Public fields

```
input Storage for input string of a formula
```

pos The current parsing position

len The length of the input

50 Parser

```
Methods
     Public methods:
       • Parser$new()
       • Parser$expect()
       • Parser$peek()
       • Parser$eat_whitespace()
       • Parser$next_token()
       • Parser$format()
       • Parser$r_expression()
       • Parser$factor()
       • Parser$term()
       • Parser$expression()
       • Parser$table_formula()
       • Parser$run()
       • Parser$clone()
     Method new(): Create a parser
       Usage:
       Parser$new()
     Method expect(): Specify expectation of next token from lexer
       Usage:
       Parser$expect(id)
       Arguments:
       id The token id expected in stream, otherwise it's an error
     Method peek(): Peek at the next token from parser
       Usage:
       Parser$peek()
     Method eat_whitespace(): Remove white space to find start of next token
       Usage:
       Parser$eat_whitespace()
     Method next_token(): Returns next lexical token
       Usage:
       Parser$next_token()
     Method format(): Return format string as token from lexical stream
       Usage:
```

Method r_expression(): Return R expression as token from lexical stream

Parser\$format()

Usage:

Parser 51

```
Parser$r_expression()
Method factor(): Return next factor as token.
 Usage:
 Parser$factor()
Method term(): Parse and return next term in stream
 Usage:
 Parser$term()
Method expression(): Parse and return next expression in stream
 Usage:
 Parser$expression()
Method table_formula(): Parse and return table formula from stream
 Usage:
 Parser$table_formula()
Method run(): Run the parser
 Usage:
 Parser$run(x)
 Arguments:
 x (character,formula) The table specification to parse
Method clone(): The objects of this class are cloneable with this method.
 Usage:
 Parser$clone(deep = FALSE)
 Arguments:
 deep Whether to make a deep clone.
```

Examples

```
Parser$new()$run("col1 + col2 + col3 ~ drug*age+spiders")
```

52 pipe.tangram

pbc

Mayo Clinic Primary Biliary Cirrhosis Data

Description

D This data is from the Mayo Clinic trial in primary biliary cirrhosis (PBC) of the liver conducted between 1974 and 1984. A total of 424 PBC patients, referred to Mayo Clinic during that tenyear interval, met eligibility criteria for the randomized placebo controlled trial of the drug D-penicillamine. The first 312 cases in the data set participated in the randomized trial and contain largely complete data. The additional 112 cases did not participate in the clinical trial, but consented to have basic measurements recorded and to be followed for survival. Six of those cases were lost to follow-up shortly after diagnosis, so the data here are on an additional 106 cases as well as the 312 randomized participants.

Usage

pbc

Format

An object of class data. frame with 418 rows and 19 columns.

Details

A nearly identical data set found in appendix D of Fleming and Harrington; this version has fewer missing values.

Included for use in example from Hmisc.

pipe.tangram

Provide a "\" operator for cbind of tangram tables

Description

The pipe operator provides an cbind for tangram tables

Usage

```
## S3 method for class 'tangram' x \mid y
```

Arguments

x left argument for rbind y right argument for rbind print.cell 53

Value

A column wise merged tangram object

print.cell

Print methods for tangram objects

Description

Print methods for tangram objects

Usage

```
## S3 method for class 'cell'
print(x, ...)

## S3 method for class 'tangram'
print(x, ...)

## S3 method for class 'summary.tangram'
print(x, ...)
```

Arguments

x object; the item to render
... additional arguments passed to summary

Value

the text summary

Examples

54 rbind.tangram

proc_tab	Tangram transform for proc_tab style summaries via a function
----------	---

Description

Given a function that produces a vector of tangram cells, will generate a table

Usage

```
proc_tab(table, row, column, fun = NULL, overall = FALSE, ...)
```

Arguments

table	The table builder object
row	The row from the abstract syntax tree that parsed the formula
column	The column from the abstract syntax tree that parsed the formula

fun The function to apply to the broken out categories overall Provide a summary of categorical breakdowns

... additional arguments to pass to fun

rbind.tangram An rbind for generated tables tangram objects.

Description

Execute the equivalent of an rbind for generated tables

Usage

```
## S3 method for class 'tangram'
rbind(..., deparse.level = 1)
```

Arguments

```
... tangram objects to rbind deparse.level numeric; not used
```

Value

A merged tangram object

render_f 55

render_f

Format a vector of provided numeric values

Description

Given a vector of data return as strings formatted as requested

Usage

```
render_f(x, format)
```

Arguments

x numeric; the data to format. Must work with quantile function.

format numeric or character; If numeric preserve that many position past the decimal,

if character pass directly into sprintf as format string

Value

character; formatted values as character strings

Examples

```
render_f(rnorm(5), 3)
render_f(round(rnorm(5), 2), "%010.03f")
```

render_route_tangram Router for rendering method

Description

This functions detects if knitr is loaded, and does it's best to determine the output format from knitr and returns the appropriate rendering function.

Usage

```
render_route_tangram()
```

Value

A rendering function to use

56 rmd

replace_cell

Replace a cell's contents

Description

Replace a cell in a table

Usage

```
replace_cell(table, row, col, object, ...)
```

Arguments

table the tangram table to modify
row numeric; The row to modify
col numeric; The column to modify
object The cell or object to replace in a table

... Additional parameters passed to cell function if not given a cell object

Value

the modified table

rmd

Generate an Rmd table entry from a cell object

Description

Given a cell object generate the corresponding piece of an Rmd table

Usage

```
rmd(object, key = FALSE, ...)
## Default S3 method:
rmd(object, key = FALSE, ...)
## S3 method for class 'cell'
rmd(object, key = FALSE, ...)
## S3 method for class 'cell_n'
rmd(object, key = FALSE, ...)
## S3 method for class 'tangram'
rmd(object, key = NULL, append = FALSE, pad = 10, ...)
```

rows 57

Arguments

object	The cell_fstat for indexing
key	A filename to write key values into. Can be false if no key file is desired.
	additional arguments to renderer. Unused
append	logical; Should the key file be appended too, or overwritten
pad	numeric; Minimum width of columns can be a single or vector of numerics.

Value

A string representation of the table

Examples

```
rmd(tangram(drug ~ bili, pbc))
```

rows

S3 object to return number of rows/cols in object

Description

Number of rows/cols in provided object

Usage

```
rows(x)

cols(x)

## S3 method for class 'list'
rows(x)

## S3 method for class 'list'
cols(x)
```

Arguments

x object; object to determine requested count

58 rtf.cell

rtf

S3 rtf Method function for use on abstract table class

Description

S3 rtf Method function for use on abstract table class

Usage

```
rtf(object, id, ...)
```

Arguments

object The cell to render to RTF

id A unique identifier for the table (strongly recommended). If not provided, cap-

tion will be used.

... additional arguments to renderer. Unused at present.

Value

A text string rendering of the given table

rtf.cell

Given a cell class create an RTF representation.

Description

Given a cell class create an RTF representation.

Usage

```
## S3 method for class 'cell'
rtf(object, id, ...)
```

Arguments

object The cell to render to RTF

id A unique identifier for traceability

... additional arguments to renderer. Unused

Value

An RTF string rendering of the given cell.

rtf.cell_chi2 59

	_	_	-			_
rt:	f.	2	11	ch	١i	つ
1 L	'	$-c_{-}$		C.I	ıт	_

Convert an abstract cell_chi2 object into an rtf string

Description

Given a cell_chi2 class create an rtf representation.

Usage

```
## S3 method for class 'cell_chi2'
rtf(object, id, ...)
```

Arguments

object The cell chi2 to render to HTML5 id A unique identifier for traceability

... additional arguments to renderer. Unused

Value

A text string rendering of the given chi2 in rtf

rtf.cell_fstat

Convert an abstract cell_fstat object into an RTF string

Description

Given a cell_fstat class create an RTF representation.

Usage

```
## S3 method for class 'cell_fstat'
rtf(object, id, ...)
```

Arguments

object The cell fstat to render to RTF
id A unique identifier for traceability
... additional arguments to renderer. Unused

Value

A text string rendering of the given fstat as a with several 's.

rtf.cell_iqr

rtf	cell	header
1 (1.	CETT	HEAUEL

Convert an abstract cell_header object into an RTF string

Description

Given a cell_header class create an RTF representation.

Usage

```
## S3 method for class 'cell_header'
rtf(object, id, ...)
```

Arguments

object The cell header to render to RTF
id A unique identifier for traceability
... additional arguments to renderer. Unused

Value

An RTF string rendering of the given header

rtf.cell_iqr

Convert an abstract cell_iqr object into an RTF string

Description

Given a cell_quantile class create an RTF representation.

Usage

```
## S3 method for class 'cell_iqr'
rtf(object, id, ..., point = 9)
```

Arguments

object	The cell quantile to render to RTF
id	A unique identifier for traceability
• • •	additional arguments to renderer. Unused
point	numeric; The font point size to use in display

Value

An RTF string rendering of the given quantile.

rtf.cell_label 61

+ C	11	label
rtt	CALL	Tanet

Given a cell_label class create an RTF representation.

Description

Given a cell_label class create an RTF representation.

Usage

```
## S3 method for class 'cell_label'
rtf(object, id, ..., point = 18)
```

Arguments

object The cell label to render to RTF

id A unique identifier for traceability

... additional arguments to renderer. Unused

size of main font for cell label

point

Value

An RTF text string rendering of the given label.

rtf.cell_n

Convert an abstract cell_n object into an RTF string

Description

Given a cell_n class create an RTF representation.

Usage

```
## S3 method for class 'cell_n'
rtf(object, id, ...)
```

Arguments

object The cell n to render to RTF
id A unique identifier for traceability
... additional arguments to renderer. Unused

Value

An RTF string rendering of the given n.

62 rtf,default

rtf.cell_subheader

Convert an abstract cell_subheader object into an RTF string

Description

Given a cell_subheader class create an RTF representation.

Usage

```
## S3 method for class 'cell_subheader'
rtf(object, id, ..., point = 9)
```

Arguments

object The cell header to render to RTF id A unique identifier for traceability

... additional arguments to renderer. Unused point numeric; The font point size to use in display

Value

An RTF string rendering of the given header

rtf.default

Default conversion to RTF for an abstract table element

Description

Gives a warning and produces an empty cell

Usage

```
## Default S3 method:
rtf(object, id, ...)
```

Arguments

object The cell to render to RTF

id A unique identifier for traceability

... additional arguments to renderer. Unused

Value

A RTF string rendering of the given cell

rtf.tangram 63

rtf	tangram	C
1 (1.	tangi alli	C

Convert a tangram into an RTF string or file

Description

Given a tangram class, a series of conversion creates an rtf representation of the table.

Usage

```
## S3 method for class 'tangram'
rtf(
   object,
   id = NA,
   caption = NA,
   fragment = FALSE,
   widths = NA,
   footnote = NA,
   filename = NA,
   append = FALSE,
   point = 9,
   ...
)
```

Arguments

The cell table to render to RTF
A unique identifier for the table (strongly recommended).
A string caption for the table
A boolean flag that determines whether a fragment or a complete RTF document is generatedf
RTF requires specified left margin and column widths, this allows user control over these (inches)
Any footnotes to include under the table.
A filename to write resulting rtf file to
A boolean for whether or not to append to given filename
Main font point size
additional arguments Fto renderer. Unused

Value

A text string rendering of the given table

select_row

select_col

Select given column(s) from a table

Description

Given a table, select the specified column(s)

Usage

```
select_col(table, col)
```

Arguments

table the table to modify

col vector containing column(s) to select

Value

the modified table

 $select_row$

 $Select\ given\ row(s)\ from\ a\ table$

Description

Given a table, select the specified rows

Usage

```
select_row(table, row)
```

Arguments

table the table to modify

row vector with row numbers to select

Value

the modified table

smd 65

List of lists, should contain a "Type" entry with a function to determine type of vector passed in. Next entries are keyed off returned types from function, and represent the type of a row. The returned list should contain the same list of types, and represents the type of a column. Thus it now returns a function to process the intersection of those two types.

Description

List of lists, should contain a "Type" entry with a function to determine type of vector passed in. Next entries are keyed off returned types from function, and represent the type of a row. The returned list should contain the same list of types, and represents the type of a column. Thus it now returns a function to process the intersection of those two types.

Usage

smd

Format

An object of class list of length 5.

smd_cell

Cell Generation functions for SMD comparisons of categorical to numerical

Description

Each function here is called when a cell is generated. Overriding these in a formula call will allows one to customize exactly how each cell's contents are generated.

Usage

smd_cell

Format

An object of class list of length 7.

Details

While this serves as the base template for transforms, it is by no means required if one develops their own bundle of data transforms. One can create ay number of cell level styling choices.

smd_compare

smd_compare

Create a SMD for a categorical set of column versus a numerical row

Description

Given a row and column object from the parser apply a Kruskal test and output the results horizontally. $1 \times (n + no. \text{ categories} + \text{test statistic})$

Usage

```
smd_compare(
  table,
  row,
  column,
  cell_style,
  style,
  smdformat = NULL,
  pformat = NULL,
  weight = NULL,
  test = FALSE,
  ...
)
```

Arguments

table The table object to modify The row variable object to use (numerical) row column The column variable to use (categorical) cell_style list; cell styling functions style character; chosen styling to final table numeric, character or function; A formatting directive to be applied to smd smdformat pformat numeric, character or function; A formatting directive to be applied to p-values weight numeric; Vector of weights to apply to data when computing SMD logical; include statistical test results test absorbs additional arugments. Unused at present.

Value

The modified table object

smd_contingency 67

smd_contingency

Create a contingency table with SMD given a row column of a formula

Description

Create a contingency table with SMD given a row column of a formula

Usage

```
smd_contingency(
  table,
  row,
  column,
  cell_style,
  style,
  smdformat = NULL,
  collapse_single = TRUE,
  weight = NULL,
  test = FALSE,
  pformat = NULL,
  ...
)
```

Arguments

table	The tablebuilder object	
row	The row node from the parser of the formula	
column	The column node provided by the parser of the formula	
cell_style	A list of all individual cell stylings to apply	
style	The global style to apply.	
smdformat	The format command to apply to smd	
collapse_single		
	Should single factor variables be collapsed	
weight	Any weighting to apply to data for computation of SMD	
test	logical; include statistical test results	
pformat	numeric, character or function; A formatting directive to be applied to p-values	
	Additional arguments to provide cell generation functions	

Value

The resulting sub table constructed

68 smd_fraction

smd		

Create an SMD distance cell

Description

Create an SMD distance cell. It calls the smd function then formats the result. If the result rounds to all zeros then it appends a less than sign and bumps the least significant digit to one.

Usage

```
smd_dist(x, group, format, weight = NULL, ...)
```

Arguments

x vector; variable to evaluate with smd

group factor; A grouping to apply. Must have 2 levels.

format formatting to apply to result

weight numeric; Weighting to apply to computation. Defaults to NULL.

... additional arguments to pass to cell generation

Value

a tangram cell

 $smd_fraction$

Create a fraction cell in the smd transform

Description

Create a fraction cell in the smd transform. In this instance it print the numerator followed by percentage in parenthesis.

Usage

```
smd_fraction(num, den, format, ...)
```

Arguments

numnumerator of fractiondendenominator of fractionformatformatting to apply to result

... additional arguments to pass to cell generation

Value

a tangram cell

smd_meansd 69

smd_meansd

Create an SMD mean and standard deviation cell

Description

Create an SMD mean and standard deviation cell. In this case it prints the mean with the standard deviation in parenthesis

Usage

```
smd_meansd(x, format, ...)
```

Arguments

x vector; variable to evaluate with smd

format formatting to apply to result

... additional arguments to pass to cell generation

Value

a tangram cell

standard_difference

Compute the standardized mean distance between 2 groups for numerical or categorical information. Using method described in 'A unifed approach to measuring the effect size between two groups using SAS' by Dongsheng Yand and Jarrod E. Dalton, 2012. SAS Global Forum 2012

Description

Compute the standardized mean distance between 2 groups for numerical or categorical information. Using method described in 'A unifed approach to measuring the effect size between two groups using SAS' by Dongsheng Yand and Jarrod E. Dalton, 2012. SAS Global Forum 2012

Usage

```
standard_difference(x, group, weight = NULL)
```

Arguments

x vector; data to estimate effect size for groups

group vector; the grouping variable.
weight vector; weighting information for x

```
summarize_kruskal_horz
```

Style Bundle for Hmisc defaults

Description

List of lists, should contain a "Type" entry with a function to determine type of vector passed in. Next entries are keyed off returned types from function, and represent the type of a row. The returned list should contain the same list of types, and represents the type of a column. Thus it now returns a function to process the intersection of those two types. There are additionally a list of cell tranforms that can be overridden and a default footnote if none is specified.

Usage

```
summarize_kruskal_horz(
  table,
  row,
  column,
  cell_style,
  pformat = NULL,
 msd = FALSE,
  quant = c(0.25, 0.5, 0.75),
  overall = NULL,
  test = FALSE,
)
summarize_kruskal_vert(
  table,
  row,
  column,
  cell_style,
  collapse_single = TRUE,
 pformat = NULL,
 msd = FALSE,
  test = FALSE,
)
summarize_chisq(
  table,
  row,
  column,
  cell_style,
  pformat = NULL,
  collapse_single = TRUE,
  overall = NULL,
```

```
test = FALSE,
  row_percents = FALSE,
  useNA = "no",
    ...
)

summarize_spearman(
  table,
  row,
  column,
  cell_style,
  pformat = NULL,
  test = FALSE,
    ...
)

hmisc
```

Arguments

table	The table object to	modify

row The row variable object to use (numerical) column The column variable to use (categorical)

cell_style list; cell styling functions

pformat numeric, character or function; A formatting directive to be applied to p-values

msd logical; Include mean and standard deviation with quantile statistics

quant numeric; Vector of quantiles to include. Should be an odd number since the

middle value is highlighted on display.

overall logical or character; Include overall summary statistics for a categorical column.

Character values are assumed to be true and used as column header.

test logical or function; include statistical test results. Function signature must be

function(row, col, cell_style, ...)

... absorbs additional arugments. Unused at present.

collapse_single

logical; default TRUE. Categorical variables with a two values collapse to single

row.

row_percents logical; use denominator across rows instead of columns.

useNA character; Specifies whether to include NA counts in the table. The allowed

values correspond to never "no" (Default), only if the count is positive "ifany"

and even for zero counts "always". An NA column is always excluded.

Format

An object of class list of length 5.

Value

The modified table object

```
summarize_kruskal_horz
```

Given a row and column object apply a Kruskal test and output the results horizontally. 1 X (n + no. categories + test statistic)

```
summarize_kruskal_vert
```

Given a row and column object from the parser apply a Kruskal test and output the results vertically (#Categories+1) X (N, Summary, Statistic)

```
summarize_chisq
```

Given a row and column object from the parser apply a chi^2 test and output the results

```
summarize_spearman
```

Given a row and column object from the parser apply a Spearman test and output the results in a 1X3 format.

hmisc

See Also

```
hmisc_data_type, tangram, hmisc_cell
```

summarize_nejm_horz 73

summarize_nejm_horz

Create a summarization for a categorical set of column versus a numerical row in NEJM style

Description

Given a row and column object from the parser apply a Kruskal test and output the results horizontally. $5 \times (n + no. categories + test statistic)$

Usage

```
summarize_nejm_horz(
  table,
  row,
  column,
  cell_style,
  pformat = NULL,
  msd = FALSE,
  quant = c(0.25, 0.5, 0.75),
  overall = NULL,
  test = FALSE,
  useNA = "no",
  ...
)
```

Arguments

table	The table object to modify
row	The row variable object to use (numerical)
column	The column variable to use (categorical)
cell_style	list; cell styling functions
pformat	numeric, character or function; A formatting directive to be applied to p-values
msd	logical; Include mean and standard deviation with quantile statistics
quant	numeric; Vector of quantiles to include. Should be an odd number since the middle value is highlighted on display.
overall	logical or character; Include overall summary statistics for a categorical column. Character values are assumed to be true and used as column header.
test	logical or function; include statistical test results. Function signature must be function(row, col, cell_style,)
useNA	character; Specifies whether to include NA counts in the table. The allowed values correspond to never "no" (Default), only if the count is positive "ifany" and even for zero counts "always". An NA column is always excluded.
• • •	absorbs additional arugments. Unused at present.

Value

The modified table object

Description

Given a row and column object from the parser apply a Kruskal test and output the results vertically (#Categories+1) X (N, Summary, Statistic)

Usage

```
summarize_nejm_vert(
  table,
  row,
  column,
  cell_style,
  collapse_single = TRUE,
  pformat = NULL,
  msd = FALSE,
  test = FALSE,
  quant = c(0.25, 0.5, 0.75),
  ...
)
```

Arguments

table	The table object to modify	
row	The row variable object to use (categorical)	
column	The column variable to use (numerical)	
cell_style	list; cell styling functions	
collapse_single	.e	
	logical; default TRUE. Categorical variables with a two values collapse to single	
	row.	
pformat	numeric, character or function; A formatting directive to be applied to p-values	
msd	logical; include msd in summary	
test	logical; include statistical test results	
quant	numeric; vector of quantiles to include. Should be an odd number since the middle value is highlighted on display.	
	absorbs additional arugments. Unused at present.	

Value

The modified table object

summary.tangram 75

summary.tangram

The default method for rendering tangram objects

Description

A tangram is a summary, so it returns itself. Otherwise convert to a text representation.

Usage

```
## $3 method for class 'tangram'
summary(object, ...)
## $3 method for class 'cell'
summary(object, ...)
```

Arguments

object object; the item to render additional arguments passed to summary

Value

the text summary

Examples

table_flatten

Given a tangram object with embedded tables, flattens to a single table.

Description

Flattening function to expanded embedded tables inside table cells.

Usage

```
table_flatten(table)
```

76 tangram.clmm2

Arguments

table

the table object to flatten

Value

the flattened table object

tangram.clmm2

Table creation methods

Description

The tangram method is the principal method to create tables. It uses R3 method dispatch. If one specifies rows and columns, one gets an empty table of the given size. A formula or character will invoke the parser and process the specified data into a table like Hmisc::summaryM. Given an rms object it will summarize that model in a table. A data.frame is converted directly into a table as well for later rendering. Can create tables from summary.rms(), anova.rms(), and other rms object info to create a single pretty table of model results. The rms and Hmisc packages are required.

Usage

```
## S3 method for class 'clmm2'
tangram(
  Х,
  id = NULL,
  style = "hmisc",
  caption = NULL,
  footnote = NULL,
 digits = NULL,
)
## S3 method for class 'summary.clmm2'
tangram(
 х,
  id = NULL,
  style = "hmisc",
  caption = NULL,
  footnote = NULL,
 digits = NULL,
 pformat = "%1.3f",
  include_p = FALSE,
)
tangram(x, ...)
```

tangram.clmm2 77

```
## S3 method for class 'numeric'
tangram(
  Х,
  cols,
  id = NULL,
  caption = NULL,
  style = "hmisc",
  footnote = NULL,
  fixed_thead = NULL,
)
## S3 method for class 'anova.lme'
tangram(
 х,
  id = NULL,
  style = "hmisc",
  caption = NULL,
  footnote = NULL,
  digits = NULL,
  fixed_thead = NULL,
)
## S3 method for class 'data.frame'
tangram(
  х,
  id = NULL,
  colheader = NA,
  caption = NULL,
  style = "hmisc",
  footnote = NULL,
  after = NA,
  quant = seq(0, 1, 0.25),
 msd = TRUE,
  as.character = NULL,
  fixed_thead = NULL,
  exclude = NULL,
)
## S3 method for class 'formula'
tangram(
 х,
 data = NULL,
  id = NULL,
  transforms = NULL,
  caption = NULL,
```

78 tangram.clmm2

```
style = "hmisc",
  footnote = NULL,
  after = NA,
 digits = NA,
 fixed_thead = NULL,
 exclude = NULL,
)
## S3 method for class 'character'
tangram(x, ...)
## S3 method for class 'table'
tangram(
 х,
  id = NULL,
 percents = FALSE,
 digits = 1,
  test = FALSE,
  footnote = NULL,
)
## S3 method for class 'ftable'
tangram(x, id = NULL, ...)
## S3 method for class 'matrix'
tangram(x, digits = NULL, ...)
## S3 method for class 'tbl_df'
tangram(x, ...)
## S3 method for class 'lm'
tangram(x, ...)
## S3 method for class 'summary.lm'
tangram(x, id = NULL, format = NULL, pformat = NULL, tformat = NULL, ...)
## S3 method for class 'rms'
tangram(
 х,
 data = NULL,
  short.labels = NULL,
 footnote = NULL,
 rnd.digits = 2,
 rnd.stats = rnd.digits,
)
```

tangram.clmm2 79

Arguments

Х	object; depends on S3 type, could be rows, formula, string of a formula, data.frame or numerical rows, an rms.model
id	character; A unique charcter id used to identify this table over multiple runs. No spaces.
style	character; Desired rendering style, currently supports "hmisc", "nejm", and "lancet". Defaults to "hmisc"
caption	character; A string with the desired caption
footnote	character; A vector of character strings as footnotes
digits	numeric; default number of digits to use for display of numerics
	addition models or data supplied to table construction routines
pformat	function or character; A function to format p values
include_p	logical; Include p-value when printing statistic
cols	numeric; An integer of the number of cols to create
fixed_thead	logical; On conversion to HTML5 should headers be treated as fixed?
colheader	character; Use as column headers in final table
after	function or list of functions; one or more functions to further process an abstract table
quant	numeric; A vector of quantiles to use for summaries
msd	logical; Include mean and standard deviation in numeric summary
as.character	logical; if true data.frames all variables are passed through as.character and no numerical summary is provided.
exclude	vector or list; When x is a data.frame this exclusion criteria is applied to the data. If this is a list then each list pair is the (column name, criteria). It is preferred to use a list to be specific.
data	data.frame; data to use for rendering tangram object
transforms	list of lists of functions; that contain the transformation to apply for summarization
percents	logical; Display percents when rendering a table object. Defaults to FALSE
test	logical or function; Perform default test or a statistical function that will return a test result when passed a row and column
format	numeric or character; Format to apply to statistic
tformat	numeric or character; format to apply to t-value
short.labels	numeric; Named vector of variable labels to replace in interaction rows. Must be in format c("variable name" = "shortened label").
rnd.digits	numeric; Digits to round reference, comparison, result and CI values to. Defaults to 2.
rnd.stats	numeric; Digits to round model LR, R2, etc to. Defaults to rnd.digits.

80 Token

Details

Note that additional arguments are passed to any subsequent transform. This means that a lot of possible arguments are not documented here but in the transform applied. Examine their documentations for additional possible arguments if needed.

Value

A tangram object (a table).

See Also

Possible transforms are (see hmisc) (*default*), nejm and lancet.

Examples

```
tangram(1, 1)
tangram(data.frame(x=1:3, y=c('a','b','c')), id="mytbl1")
tangram(drug ~ bili + albumin + protime + sex + age + spiders, pbc, id="mytbl2")
tangram("drug~bili+albumin+stage::Categorical+protime+sex+age+spiders", pbc,"mytbl3")
```

Token

A token in the formula grammar

Description

A token in the formula grammar A token in the formula grammar

Format

R6Class object.

Public fields

```
id The token identifier, E.g. "LPAREN" name Information about the token, useful with IDENTIFIERs.
```

Methods

Public methods:

- Token\$new()
- Token\$clone()

```
Method new(): Construct a lexical token
```

```
Usage:
Token$new(id, name = "")
```

Token 81

Arguments:

id (character) The lexical id of the token name (character) Additional token information if needed

Method clone(): The objects of this class are cloneable with this method.

Usage:

Token\$clone(deep = FALSE)

Arguments:

deep Whether to make a deep clone.
