# Package 'Rcssplot'

# November 10, 2024

Title Styling of Graphics using Cascading Style Sheets
Version 1.1.0
Author Tomasz Konopka [aut, cre]
Maintainer Tomasz Konopka <tokonopka@gmail.com></tokonopka@gmail.com>
<b>Description</b> Provides a means to style plots through cascading style sheets.  This separates the aesthetics from the data crunching in plots and charts.
<b>Depends</b> R (>= 3.4.0)
Imports methods, graphics, grDevices, stats, utils
Suggests knitr, rmarkdown, testthat
License GPL-2
<pre>URL https://github.com/tkonopka/Rcssplot</pre>
VignetteBuilder knitr
RoxygenNote 7.1.1

# Description

This is a wrapper for R's abline function. See R's documentation for graphics::abline for further details.

arrows 3

## Usage

```
abline(
    a = NULL,
    b = NULL,
    h = NULL,
    v = NULL,
    reg = NULL,
    coef = NULL,
    Rcss = "default",
    Rcssclass = NULL,
    ...
)
```

## **Arguments**

a, b	coefficient (intercet and slope) for line
h, v	horizontal, vertical positions for line
reg	an object with a coef method
coef	vector with interect and slope for line
Rcss	style sheet object. Leave "default" to use a style defined via $RcssSetDefaultStyle()$ .
Rcssclass	character, style class
	Further parameters, see documentation of abline()

# **Examples**

```
# draw a set of horizontal lines and a vertical line plot(c(0, 1), c(0, 1), type="n") abline(h=seq(0, 1, by=0.2)) abline(v=0.8)
```

arrows

Add styled arrows to a plot

# Description

This is a wrapper for R's arrows function. See R's documentation for graphics::arrows for further details.

# Usage

```
arrows(x0, y0, x1 = x0, y1 = y0, Rcss = "default", Rcssclass = NULL, ...)
```

4 axis

# Arguments

x0, y0	coordinates of *from* endpoint
x1, y1	coordinates of *to* endpoint
Rcss	style sheet object. Leave "default" to use a style defined via RcssSetDefaultStle()
Rcssclass	character, style class
• • •	Futher parameters, see documentation of graphics::arrows

# Examples

```
# draw an arrow
plot(c(0, 1), c(0, 1), type="n")
arrows(0.2, 0.2, x1=0.8, y1=0.5)
```

axis

Add a styled axis to a plot

# Description

This is a wrapper for R's axis function. See R's documentation for graphics::axis for further details.

## Usage

```
axis(side, Rcss = "default", Rcssclass = NULL, ...)
```

# Arguments

side	integer specifying what side of the plot to draw the axis. The codes are 1: bottom, 2: left, 3: top, 4: top. vertices
Rcss	style sheet object. Leave "default" to use a style defined via RcssSetDefault-Style()
Rcssclass	sub class of style sheet
	Further parameters, see documentation of graphics::axis

```
# draw separate axes on an empty plot plot(c(0, 1), c(0, 1), type="n", axes=FALSE, xlab="x-axis", ylab="") axis(1) axis(3)
```

barplot 5

barplot	Draw a styled barplot	

#### Description

This is a wrapper for R's barplot function. See R's documentation for graphics::barplot for further details.

#### **Usage**

```
barplot(height, Rcss = "default", Rcssclass = NULL, ...)
```

# Arguments

height numeric vector giving bar lengths

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Resselass character, style class

... Further parameters, see documentation of graphics::barplot

## **Examples**

```
# draw a complete barplot
barplot(1:5)
```

box

Add a styled box around a plot

## **Description**

This is a wrapper for R's box function. See R's documentation for graphics::box for further details.

# Usage

```
box(which = "plot", Rcss = "default", Rcssclass = NULL, ...)
```

# **Arguments**

which character specifying where to draw a box; see documentation of box()

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Rcssclass sub class of style sheet

... Further parameters, see documentation of graphics::box

6 cairo\_pdf

#### **Examples**

```
# draw a box around an existing plot plot(c(0, 1), c(0, 1), type="n", frame=FALSE) box(lwd=3)
```

boxplot

Draw a styled boxplot

## **Description**

This is a wrapper for R's boxplot function. See R's documentation for graphics::boxplot for further details.

#### Usage

```
boxplot(x, Rcss = "default", Rcssclass = NULL, ...)
```

## **Arguments**

x data for boxplot; either single numeric vector or a list of numeric vectors; see

documentation of boxplot()

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Resselass character, style class

... Further parameters, see documentation of graphics::boxplot

## **Examples**

```
# draw a complete boxplot
dataset <- list(A=rpois(30, 10), B=rpois(30, 20))
boxplot(dataset, col=c("#dd0000", "#dd8888"))</pre>
```

cairo\_pdf

Create a styled cairo\_pdf figure

## **Description**

This is a wrapper for R's cairo\_pdf function. See R's documentation for grDevices::cairo\_pdf for further details

#### Usage

```
cairo_pdf(filename, Rcss = "default", Rcssclass = NULL, ...)
```

contour 7

# **Arguments**

filename character string with file name

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefaultStyle()

Rcssclass character, style class
... Further parameters, see documentation of grDevices::pdf

... Turther parameters, see to

#### **Details**

Note this uses styles from 'pdf' css selectors

#### **Examples**

```
# send content of graphics to a pdf file
# to run this, un-comment the pdf() and dev.off() lines
# cairo_pdf(file="example-file.pdf")
barplot(1:5)
# dev.off()
```

contour

Draw a styled contour

## **Description**

This is a wrapper for R's contour function. See R's documentation for graphics::contour for further details.

#### Usage

```
contour(
  x = seq(0, 1, length.out = nrow(z)),
  y = seq(0, 1, length.out = ncol(z)),
  z,
  Rcss = "default",
  Rcssclass = NULL,
  ...
)
```

## Arguments

```
x numeric vector; locations of grid lines
y numeric vector; locations of grid lines
z matrix of values
Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-Style()
Rcssclass character, style class
... Further parameters, see documentation of graphics::contour
```

8 ctext

# **Examples**

```
# draw a complete contour plot
dataset <- outer(1:10, 1:10)
contour(z=dataset)</pre>
```

ctext

Write styled text into a plot corner

# Description

This can be suitable for placing a label in a multi-panel figure. Note the automatic placement does not work when a plot is generated with logarithmic scales.

# Usage

```
ctext(
  label,
  x = NULL,
  y = NULL,
  adj = NULL,
  cex = NULL,
  Rcss = "default",
  Rcssclass = NULL,
  ...
)
```

## **Arguments**

```
labelcharacter, text for corner labelx, ynumeric, positions for manual placementadjnumeric of length 2, argument adj for textcexnumeric, argument cex for textRcssstyle sheet objectRcssclasscharacter, style class...additional argument, passed to text()
```

```
plot(1:10, 1:10)
ctext("A")
```

grid 9

grid

#' Draw a styled grid

## **Description**

This is a wrapper for R's grid function. See R's documentation for graphics::grid for further details.

## Usage

```
grid(Rcss = "default", Rcssclass = NULL, ...)
```

#### Arguments

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Resselass character, style class

... Further parameters, see documentation of graphics::grid

#### **Examples**

```
# add a grid to an existing plot
plot(c(0, 10), c(0, 10), type="n", xaxs="i", yaxs="i", las=1)
grid(nx=10, ny=5, col="#777777")
```

hist

Draw a styled histogram

#### **Description**

This is a wrapper for R's hist function. See R's documentation for graphics::hist for further details.

## Usage

```
hist(x, Rcss = "default", Rcssclass = NULL, ...)
```

## **Arguments**

x numeric vector

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Rcssclass character, style class

Further parameters, see documentation of graphics::hist

jpeg jpeg

#### **Examples**

```
# draw a complete histogram
dataset <- rpois(400, 6)
hist(dataset, breaks=seq(0, max(dataset)))
# only obtain the bin counts, without plotting
histdata <- hist(dataset, breaks=seq(0, 2+max(dataset), by=2), plot=FALSE)
histdata</pre>
```

jpeg

Create a styled jpg figure

# Description

This is a wrapper for R's jpeg function. See R's documentation for grDevices::jpeg for further details

# Usage

```
jpeg(file, Rcss = "default", Rcssclass = NULL, ...)
```

#### **Arguments**

file character string with file name

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Rcssclass character, style class

... Further parameters, see documentation of grDevices::jpeg

```
# send content of graphics to a jpg file
# to run this, un-comment the jpeg() and dev.off() lines
# jpeg(file="example-file.jpg")
barplot(1:5)
# dev.off()
```

legend 11

legend A	Add a styled legend to aplot
----------	------------------------------

## Description

This is a wrapper for R's legend function. See R's documentation for graphics::legend for further details.

## Usage

```
legend(x, y = NULL, legend, Rcss = "default", Rcssclass = NULL, ...)
```

## Arguments

x, y position of the legend
legend character vector with labels (text appears in the legend)

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-Style()

Rcssclass character, style class

... Further parameters, see documentation of graphics::legend

## **Examples**

```
# add a legend to an existing plot
plot(1:8, 1:8, col=rep(c(1,2), each=4), pch=19)
legend(7, 3, c("A", "B"), pch=19, col=1:2)
```

lines

Add styled line segments to a plot

# Description

This is a wrapper for R's lines function. See R's documentation for graphics::lines for further details.

#### Usage

```
lines(x, y = NULL, Rcss = "default", Rcssclass = NULL, ...)
```

#### **Arguments**

x, y coordinates for start and end points for lines

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefaultStyle()

Rcssclass character, style class

... Further parameters, see documentation of graphics::lines

12 matplot

# **Examples**

```
# add lines to an existing plot area
plot(c(0, 10), c(0, 10), type="n")
lines(c(1,8), c(2, 2), lwd=3, col="black")
lines(c(1, 7, NA, 4, 9), c(1, 6, NA, 1, 3), lwd=1, col="blue")
lines(c(8, 3), c(7, 9), lwd=3, lty=2, col="red")
```

matplot

Add styled line segments to a plot

## **Description**

This is a wrapper for R's matplot function. See R's documentation for graphics::matplot for further details.

# Usage

```
matplot(x, y, Rcss = "default", Rcssclass = NULL, ...)
```

# Arguments

x, y	vectors or matrices of data for plotting. The number of rows should match. If one of them are missing, the other is taken as y and an x vector of 1:n is used. Missing values (NAs) are allowed.
Rcss	style sheet object. Leave "default" to use a style defined via RcssSetDefault-Style()
Rcssclass	character, style class
	Further parameters, see documentation of graphics::lines

```
# draw scatter based on column in a matrix
dataset = cbind(A=rnorm(20), B=rnorm(20))
matplot(dataset)
```

mtext 13

mtext

Write styled text into a plot margin

#### **Description**

This is a wrapper for R's mtext function. See R's documentation for graphics::mtext for further details.

#### Usage

```
mtext(text, Rcss = "default", Rcssclass = NULL, ...)
```

#### **Arguments**

text characters to print on the plot

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Rcssclass character, style class

... Further parameters, see documentation of graphics::mtext

## **Examples**

```
# draw text into a margin
plot(c(0, 1), c(0, 1), type="n", xlab="", ylab="")
mtext(side=1, "bottom x-axis label", line=2.5)
mtext(side=2, "left y-axis label", line=2.5)
mtext(side=3, "top x-axis label")
mtext(side=4, "right y-axis label")
```

par

Set styled parameters for base graphics

## **Description**

This is a wrapper for R's par function. See R's documentation for graphics::par for further details.

# Usage

```
par(Rcss = "default", Rcssclass = NULL, ...)
```

#### **Arguments**

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Resselass character, style class

... Further parameters, see documentation of graphics::par

14 pdf

#### **Examples**

```
# set properties for plot
par(ps=8, mar=c(3, 8, 3, 1))
plot(c(0, 1), c(0, 1), type="n", frame=FALSE)
text(rep(0.5, 2), c(0.2, 0.5), c("abc", "def"))
par(ps=12)
text(0.5, 0.8, "xyz")
```

parplot

combination of par and plot

## **Description**

The sequence of par() and plot() occurs so frequently that it a shortcut is helpful.

## Usage

```
parplot(x, y, Rcss = "default", Rcssclass = NULL, ...)
```

## **Arguments**

x, y coordinates for points on the plot

Rcss style sheet object, leave "default" to use a style defined via RcssDefaultStyle()

Resselass character, style class

... Further parameters, passed to plot()

# **Examples**

```
parplot(x=1:4, y=c(1,3,2,4))
```

pdf

Create a styled pdf figure

## **Description**

This is a wrapper for R's pdf function. See R's documentation for grDevices::pdf for further details

# Usage

```
pdf(file, Rcss = "default", Rcssclass = NULL, ...)
```

plot 15

#### **Arguments**

file character string with file name

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Resselass character, style class

... Further parameters, see documentation of grDevices::pdf

#### **Examples**

```
# send content of graphics to a pdf file
# to run this, un-comment the pdf() and dev.off() lines
# png(file="example-file.pdf")
barplot(1:5)
# dev.off()
```

plot

Create a styled plot

#### Description

This is a wrapper for R's plot function. See R's documentation for graphics::plot for further details.

#### Usage

```
plot(x, y, Rcss = "default", Rcssclass = NULL, ...)
```

# **Arguments**

x, y coordinates for points on the plot

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Resselass character, style class

... Further parameters, see documentation of graphics::plot

```
# draw a new empty plot area - unit square plot(c(0, 1), c(0, 1), type="n", xlab="", ylab="") # draw a plot area, automatically add some points plot(runif(20), rpois(20, 100))
```

16 points

png

Create a styled png figure

#### **Description**

This is a wrapper for R's png function. See R's documentation for grDevices::png for further details.

## Usage

```
png(file, Rcss = "default", Rcssclass = NULL, ...)
```

#### **Arguments**

file character string with file name

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Rcssclass character, style class

... Further parameters, see documentation of grDevices::png

#### **Examples**

```
# send content of graphics to a png file
# to run this, un-comment the png() and dev.off() lines
# png(file="example-file.png")
barplot(1:5)
# dev.off()
```

points

Add styled points to a plot

#### **Description**

This is a wrapper for R's points function. See R's documentation for graphics::points for further details.

#### Usage

```
points(x, y = NULL, Rcss = "default", Rcssclass = NULL, ...)
```

#### **Arguments**

x, y coordinates for points on the plot

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Rcssclass character, style class

... Further parameters, see documentation of graphics::points

polygon 17

#### **Examples**

```
# draw a set of points onto an existing plot
plot(c(0, 1), c(0, 1), type="n")
points(runif(10), runif(10))
points(runif(10), runif(10), col="blue", pch=19)
```

polygon

Draw a styled polygon on a plot

#### **Description**

This is a wrapper for R's polygon function. See R's documentation for graphics::polygon for further details.

# Usage

```
polygon(x, y = NULL, Rcss = "default", Rcssclass = NULL, ...)
```

# **Arguments**

x, y coordinates for polygon vertices

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Resselass character, style class

... Further parameters, see documentation of graphics::polygon

## **Examples**

```
# draw a multi-sided shape on an existing plot plot(c(0, 10), c(0, 10), type="n", xlab="", ylab="") polygon(c(1, 4, 7, 7, 1), c(1, 1, 4, 8, 8), col="blue")
```

print.Rcss

Show basic information about an Rcss object

# **Description**

Display selectors encoded in an Rcss object. For more detailed information about the object, see function printRcss()

#### **Usage**

```
## S3 method for class 'Rcss'
print(x, ...)
```

printRcss

# Arguments

```
x style sheet object
```

... Further parameters are ignored

## **Examples**

```
# define a custom style, display it
custom.style <- Rcss(text="points { cex: 2; }")
custom.style</pre>
```

printRcss

Display properties encoded in an Rcss object

## **Description**

Display properties encoded in an Rcss object, including any subclasses.

## Usage

```
printRcss(Rcss, selector = NULL, verbose = FALSE)
```

#### **Arguments**

Rcss style sheet object

selector character string with name of selector to print

verbose logical. If TRUE, function prints all information about the selector, including

subclasses. If FALSE, function omits detailed information about subclasses.

```
# define a custom style
custom.style <- Rcss(text="points { pch:2; } points.A { pch: 3; }")
# printing details for a selector, concise and verbose
printRcss(custom.style, "points")
printRcss(custom.style, "points", verbose=TRUE)</pre>
```

Rcss 19

Rcss

Create an Rcss style object

# Description

Creates a style sheet object using definition specified in an Rcss file. When a file is not specified, creates a base object object without any styling.

# Usage

```
Rcss(file = NULL, text = NULL)
```

## **Arguments**

file filename containing Rcss definitions. If set to NULL, function returns a basic

Rcss object. If multiple files, function reads each one and produces a joint style.

text character, a string with Rcss

## **Details**

See also related functions RcssGetDefaultStyle() and RcssOverload().

#### Value

Rcss object

```
# define a custom style
custom.style <- Rcss(text="plot { pch:19; col: 2 }")
# display the custom style
printRcss(custom.style, "plot")
# use the custom style in a chart
plot(1:4, 1:4, Rcss=custom.style)</pre>
```

20 RessChange

Rcss	Cha	nge

Modify an Rcss style sheet object

## **Description**

Creates a new Rcss style sheet object from the input, modifying one or more properties.

#### Usage

```
RcssChange(
  selector,
  propertylist = NULL,
  property = NULL,
  value = NULL,
  Rcssclass = NULL,
  Rcss = "default"
)
```

# **Arguments**

selector name of one selector ("text", "plot", "axis", etc.)

propertylist list with property/value pairs to update

property name of a single property. This is only used when propertylist is set to NULL

value new values associated with property above. This is only used propertylist is set to NULL

Resselass subclass of style sheet. Leave NULL to change base property. Provide one character value to edit one subclass. Provide a vector to edit a subclass of a subclass of a ...

# Rcss style sheet object

#### Value

always returns an Rcss object. Note: when changing the default style, this will return a new style without actually affecting the default style. To change how the default works in practice, assign this return value to RcssDefaultStyle

```
style1 <- Rcss(text="points { cex: 1; pch: 19; }")
printRcss("points", Rcss=style1, verbose=TRUE)
style2 <- RcssChange("points", list(cex=2), Rcss=style1)
printRcss("points", Rcss=style2, verbose=TRUE)</pre>
```

RcssChangePropertyValue

Modify an Rcss style sheet object

## **Description**

Creates a new Rcss style sheet object from the input, modifying one or more properties.

# Usage

```
RcssChangePropertyValue(
  Rcss,
  selector,
  Rcssclass = NULL,
  propertylist = NULL,
  property = NULL,
  value = NULL
)
```

#### **Arguments**

Rcss style sheet object

selector name of one selector ("text", "plot", "axis", etc.)

Rcssclass subclass of style sheet. Leave NULL to change base property. Provide one

character value to edit one subclass. Provide a vector to edit a subclass of a

subclass of a ...

propertylist list with property/value pairs to update

property name of a single property. This is only used when propertylist is set to NULL

value new values associated with property above. This is only used propertylist is set

to NULL

#### **Details**

Equivallent to RcssChange: use RcssChange instead

```
# use RcssChange instead
```

RcssCompulsoryClass

Vector holding set a compulsory Resselass

# Description

These style class (or classes) are applied in all functions of the Rcss family.

# Usage

RcssCompulsoryClass

#### **Format**

An object of class NULL of length 0.

RcssDefaultStyle

Default Ressplot style sheet

# Description

This style sheet will be applied in all functions of the Rcss family.

# Usage

RcssDefaultStyle

#### **Format**

An object of class NULL of length 0.

RcssGetCompulsoryClass

Get current state of compulsory Resselass

# Description

Fetches the value of the RcssCompulsoryClass object defined in parent environments.

# Usage

RcssGetCompulsoryClass(Rcssclass = NULL)

RcssGetDefaultStyle 23

# **Arguments**

Rcssclass

character vector, set of additional compulsory classes. When NULL, function returns the current set of compulsory classes defined in parent environments. When non-NULL, functions returns the concatentation of the current set and new set.

#### **Examples**

```
# retrieve the current compulsory class
class.null <- RcssGetCompulsoryClass()

# augment the current compulsory class with more labels
class.A <- RcssGetCompulsoryClass("A")
class.A
class.B <- RcssGetCompulsoryClass("B")
class.B</pre>

# when the object RcssCompulsoryClass is set, this augments a vector
RcssCompulsoryClass <- c("X", "Y")
class.XYZ <- RcssGetCompulsoryClass("Z")
class.XYZ</pre>
```

 ${\tt RcssGetDefaultStyle}$ 

Get default Ressplot style object

#### **Description**

Fetches the value of the RcssDefaultStyle object defined in parent environments.

# Usage

```
RcssGetDefaultStyle(Rcss = "default")
```

## **Arguments**

Rcss

Rcss object, replacement default style object. When set to "default", the function returns a copy of the default object defined in parent environment. When set to Rcss object, the function ignores the default and returns the set object back.

```
# retrieve the current default style
style.now <- RcssGetDefaultStyle()</pre>
```

RcssGetPropertyValue Extract a value for an Rcss property

#### **Description**

Extract a value for a property from an Rcss style sheet object. Returns a list with two items. "Defined" is a boolean that indicates the property is defined in the style sheet. "Value" gives the actual value of the property.

### Usage

```
RcssGetPropertyValue(Rcss, selector, property, Rcssclass = NULL)
```

#### **Arguments**

Rcss style sheet object

selector name of selector of interest (e.g. "plot", "axis", "text", etc.)

property name of property of interest (e.g. "col", "pch", etc.)

Rcssclass subclass of style sheet

#### **Details**

Equivalent to RcssProperty; use RcssProperty instead.

## **Examples**

```
# use RcssProperty or RcssValue instead
```

RcssGetPropertyValueOrDefault

Extract a value for an Rcss property

# Description

If the requested property is defined within an Rcss object, this function will return the associated value. If the property is not defined, the function returns a default value that can be passed into the function and is set NULL otherwise. See also RcssGetPropertyValue().

#### Usage

```
RcssGetPropertyValueOrDefault(
  Rcss,
  selector,
  property,
  default = NULL,
  Rcssclass = NULL
)
```

RcssOverload 25

## **Arguments**

Rcss style sheet object

selector name of selector of interest (e.g. "plot", "axis", "text", etc.)

property name of property of interest (e.g. "col", "pch", etc.)

default value to return if the desired property is not defined in Rcss

Rcssclass subclass of style sheet

#### **Details**

Equivalent to RcssValue(); use RcssValue() instead

#### **Examples**

# use RcssValue instead

RcssOverload

Overloads base graphics functions by their Ressplot wrappers

# Description

Ressplot graphics functions have 'Ress' prefixes, e.g Resstext(). This function can be invoked to overload base-graphics functions by their Ress wrappers. i.e. After executing this function, you can execute e.g. text() and automatically use the Ress capabilities.

# Usage

RcssOverload()

#### Details

Warning: this function creates masking objects in your current environment for many base-graphics functions. See documentation for details.

```
# this function is deprecated - do not use it
suppressWarnings(RcssOverload())
```

26 RcssValue

RcssPropert	tν
-------------	----

Extract information about property and its value

# Description

Extract information about property and its value

#### Usage

```
RcssProperty(selector, property, Rcssclass = NULL, Rcss = "default")
```

## **Arguments**

```
selector character, name of selector, e.g. 'points'
property character, name of property, e.g. 'col'
Rcssclass character or vector, subclass in Rcss
```

Rcss Rcss object

#### Value

list with two ites. Component "defined" is a boolean that indicates whether the property is defined in the style. Component "value" gives the actual value associated to the property.

## **Examples**

```
style1 <- Rcss(text="points { cex: 2; }")
# cex is defined, col is not defined
RcssProperty("points", "cex", Rcss=style1)
RcssProperty("points", "col", Rcss=style1)</pre>
```

RcssValue

Extracts a value from an Rcss object

# Description

If the selector and property are defined in the Rcss object, this function will return the value stored in the Rcss object. Otherwise, the function will return a default value. See also related functions RcssGetPropertyValueOrDefault, which is the same, except that RcssValue is shorter to write and takes the Rcss object as its last argument.

RessWatch 27

## Usage

```
RcssValue(
   selector,
   property,
   default = NULL,
   Rcssclass = NULL,
   Rcss = "default"
)
```

## **Arguments**

selector character, name of selector, e.g. 'points'
property character, name of property to get, e.g. 'col'

default value to return if selector/property are not defined

Resselass character or vector, subclass in Ress

Rcss object

#### Value

a value from the Rcss object

# **Examples**

```
style1 <- Rcss(text="custom { key: 100 }")
RcssValue("custom", "key", default=1, Rcss=style1)
RcssValue("custom", "key2", default=0, Rcss=style1)</pre>
```

RcssWatch

development tool for adjusting Rcss and R graphics code

# **Description**

This is a macro script that loads R code and a default Rcss style, and then executes a function. This process is repeated indefinitely.

## Usage

```
RcssWatch(f, files = NULL, ...)
```

# Arguments

f function or character of function name, executed at each iteration files character, paths to R and Rcss files other arguments, passed to function f

28 rect

#### **Examples**

```
# Note: the examples below draw a charat once and exit.
# To enable quick re-drawing, RcssWatch must be provided with file paths
# draw and redraw a bar plot
RcssWatch(plot, x=1:4, y=1:4)
# alternative syntax, using a function name as a string
custom.barplot <- function(x=1:4, main="") { barplot(x, main=main) }
RcssWatch("custom.barplot", main="Custom")
# for more interesting behavior, specify a files with styles and R source</pre>
```

rect

Draw styled rectangles on a plot

#### **Description**

This is a wrapper for R's rect function. See R's documentation for graphics::rect for further details.

## Usage

```
rect(xleft, ybottom, xright, ytop, Rcss = "default", Rcssclass = NULL, ...)
```

#### **Arguments**

```
xleft, ybottom, xright, ytop
```

vector of coordinates for rectangles' vertices

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Resselass character, style class

... Further parameters, see documentation of graphics::rect

```
# draw rectangles on an existing plot
plot(c(0, 10), c(0, 10), type="n", xlab="", ylab="")
rect(4.5, 1, 5.5, 3)
rect(c(1, 7.5), c(6, 6), c(2.5, 9), c(8, 8))
```

stripchart 29

stripchart	Draw styled strip chart

#### **Description**

This is a wrapper for R's stripchart function. See R's documentation for graphics::stripchart for further details.

#### Usage

```
stripchart(x, Rcss = "default", Rcssclass = NULL, ...)
```

#### **Arguments**

x list of numeric vectors

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Rcssclass character, style class

. . . Further parameters, see documentation of graphics::stripchart

#### **Examples**

```
# draw a complete strip-chart plot
dataset <- list(A=c(1,9,3,8), B=c(3,4,2,9,2), C=rpois(8, 10))
stripchart(dataset)
stripchart(dataset, method="jitter", vertical=TRUE, pch=19)</pre>
```

svg

Create a styled svg figure

# Description

This is a wrapper for R's svg function. See R's documentation for grDevices::svg for further details

#### Usage

```
svg(filename, Rcss = "default", Rcssclass = NULL, ...)
```

# Arguments

filename character string with file name

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-

Style()

Resselass character, style class

Further parameters, see documentation of grDevices::svg

30 text

#### **Examples**

```
# send content of graphics to a pdf file
# to run this, un-comment the pdf() and dev.off() lines
# svg(file="example-file.svg")
barplot(1:5)
# dev.off()
```

text

Add styled text to a plot

# Description

This is a wrapper for R's text function. See R's documentation for graphics::text for further details.

# Usage

```
text(
   x,
   y = NULL,
   labels = seq_along(x),
   Rcss = "default",
   Rcssclass = NULL,
   ...
)
```

#### **Arguments**

x, y coordinates where to write labels
labels characters to print on the plot

Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefaultStyle()

Rcssclass character, style class
... Further parameters, see documentation of graphics::text

```
# add text to an existing plot
plot(c(0, 1), c(0, 1), type="n")
text(0.1, 0.1, "A")
text(c(0.2, 0.7), c(0.8, 0.6), c("B", "C"))
```

title 31

title

Add styled annotation to a plot

# Description

This is a wrapper for R's title function. See R's documentation for graphics::title for further details.

# Usage

```
title(
  main = NULL,
  sub = NULL,
  xlab = NULL,
  ylab = NULL,
  Rcss = "default",
  Rcssclass = NULL,
  ...
)
```

# Arguments

```
main plot title
sub plot sub title
xlab, ylab labels on axes
Rcss style sheet object. Leave "default" to use a style defined via RcssSetDefault-
Style()
Rcssclass character, style class
... Further parameters, see documentation of graphics::title
```

```
# add a title
plot(c(0, 1), c(0, 1), type="n", xlab="", ylab="")
title("This is the title")
title(sub="This is a bottom title")
```
