Package 'rentrez'

October 14, 2022

```
Version 1.2.3
Date 2020-11-06
Title 'Entrez' in R
Depends R (>= 2.6.0)
Imports XML, httr (>= 0.5), jsonlite (>= 0.9)
Suggests testthat, knitr, rmarkdown
URL https://docs.ropensci.org/rentrez/ (website)
       https://github.com/ropensci/rentrez/
BugReports https://github.com/ropensci/rentrez/issues/
Description Provides an R interface to the NCBI's 'EUtils' API,
       allowing users to search databases like 'GenBank'
       <a href="https://www.ncbi.nlm.nih.gov/genbank/">https://www.ncbi.nlm.nih.gov/genbank/</a> and 'PubMed'
       <a href="https://pubmed.ncbi.nlm.nih.gov/">https://pubmed.ncbi.nlm.nih.gov/</a>, process the
       results of those searches and pull data into their R sessions.
VignetteBuilder knitr
License MIT + file LICENSE
RoxygenNote 7.1.1
Encoding UTF-8
NeedsCompilation no

Index		20

entrez_citmatch

Fetch pubmed ids matching specially formatted citation strings

Description

Fetch pubmed ids matching specially formatted citation strings

Usage

```
entrez_citmatch(bdata, db = "pubmed", retmode = "xml", config = NULL)
```

Arguments

bdata	character, containing citation data. Each citation must be represented in a pipe-delimited format journal_titlelyearlvolumelfirst_pagelauthor_namelyour_key The final field "your_key" is arbitrary, and can used as you see fit. Fields can be left empty, but be sure to keep 6 pipes.
db	character, the database to search. Defaults to pubmed, the only database currently available
retmode	character, file format to retrieve. Defaults to xml, as per the API documentation, though note the API only returns plain text
config	vector configuration options passed to httr::GET

Value

A character vector containing PMIDs

entrez_dbs 3

See Also

```
config for available configs
```

Examples

entrez_dbs

List databases available from the NCBI

Description

Retrieves the names of databases available through the EUtils API

Usage

```
entrez_dbs(config = NULL)
```

Arguments

config

config vector passed to httr::GET

Value

character vector listing available dbs

See Also

```
Other einfo: entrez_db_links(), entrez_db_searchable(), entrez_db_summary(), entrez_info()
```

```
## Not run:
entrez_dbs()
## End(Not run)
```

4 entrez_db_links

entrez_db_links

List available links for records from a given NCBI database

Description

For a given database, fetch a list of other databases that contain cross-referenced records. The names of these records can be used as the db argument in entrez_link

Usage

```
entrez_db_links(db, config = NULL)
```

Arguments

db character, name of database to search config config vector passed to httr::GET

Value

An eInfoLink object (sub-classed from list) summarizing linked-databases. Can be coerced to a data-frame with as.data.frame. Printing the object the name of each element (which is the correct name for entrez_link, and can be used to get (a little) more information about each linked database (see example below).

See Also

```
entrez_link
```

Other einfo: entrez_db_searchable(), entrez_db_summary(), entrez_dbs(), entrez_info()

```
## Not run:
taxid <- entrez_search(db="taxonomy", term="Osmeriformes")$ids
tax_links <- entrez_db_links("taxonomy")
tax_links
entrez_link(dbfrom="taxonomy", db="pmc", id=taxid)
sra_links <- entrez_db_links("sra")
as.data.frame(sra_links)
## End(Not run)</pre>
```

entrez_db_searchable 5

entrez_db_searchable List available search fields for a given database

Description

Fetch a list of search fields that can be used with a given database. Fields can be used as part of the term argument to entrez_search

Usage

```
entrez_db_searchable(db, config = NULL)
```

Arguments

db character, name of database to get search field from config config vector passed to httr::GET

Value

An eInfoSearch object (subclassed from list) summarizing linked-databases. Can be coerced to a data-frame with as.data.frame. Printing the object shows only the names of each available search field.

See Also

```
entrez_search
Other einfo: entrez_db_links(), entrez_db_summary(), entrez_dbs(), entrez_info()
```

```
## Not run:
pmc_fields <- entrez_db_searchable("pmc")
pmc_fields[["AFFL"]]
entrez_search(db="pmc", term="Otago[AFFL]", retmax=0)
entrez_search(db="pmc", term="Auckland[AFFL]", retmax=0)

sra_fields <- entrez_db_searchable("sra")
as.data.frame(sra_fields)

## End(Not run)</pre>
```

6 entrez_db_summary

entrez_db_summary

Retrieve summary information about an NCBI database

Description

Retrieve summary information about an NCBI database

Usage

```
entrez_db_summary(db, config = NULL)
```

Arguments

db character, name of database to summaries

config config vector passed to httr::GET

Value

Character vector with the following data

DbName Name of database

Description Brief description of the database

Count Number of records contained in the database

MenuName Name in web-interface to EUtils

DbBuild Unique ID for current build of database

LastUpdate Date of most recent update to database

See Also

```
Other einfo: entrez_db_links(), entrez_db_searchable(), entrez_dbs(), entrez_info()
```

```
## Not run:
entrez_db_summary("pubmed")
## End(Not run)
```

entrez_fetch 7

entrez_fetch	Download data from NCBI databases	
--------------	-----------------------------------	--

Description

Pass unique identifiers to an NCBI database and receive data files in a variety of formats. A set of unique identifiers mustbe specified with either the db argument (which directly specifies the IDs as a numeric or character vector) or a web_history object as returned by entrez_link, entrez_search or entrez_post.

Usage

```
entrez_fetch(
  db,
  id = NULL,
  web_history = NULL,
  rettype,
  retmode = "",
  parsed = FALSE,
  config = NULL,
  ...
)
```

Arguments

db	character, name of the database to use
id	vector (numeric or character), unique ID(s) for records in database db. In the case of sequence databases these IDs can take form of an NCBI accession followed by a version number (eg AF123456.1 or AF123456.2).
web_history,	a web_history object
rettype	character, format in which to get data (eg, fasta, xml)
retmode	character, mode in which to receive data, defaults to an empty string (corresponding to the default mode for rettype).
parsed	boolean should entrez_fetch attempt to parse the resulting file. Only works with xml records (including those with rettypes other than "xml") at present
config	vector, httr configuration options passed to httr::GET
	character, additional terms to add to the request, see NCBI documentation linked to in references for a complete list

Details

The format for returned records is set by that arguments rettype (for a particular format) and retmode for a general format (JSON, XML text etc). See Table 1 in the linked reference for the set of formats available for each database. In particular, note that sequence databases (nuccore, protein and their relatives) use specific format names (eg "native", "ipg") for different flavours of xml.

8 entrez_global_query

For the most part, this function returns a character vector containing the fetched records. For XML records (including 'native', 'ipg', 'gbc' sequence records), setting parsed to TRUE will return an XMLInternalDocument,

Value

character string containing the file created

XMLInternalDocument a parsed XML document if parsed=TRUE and rettype is a flavour of XML.

References

```
https://www.ncbi.nlm.nih.gov/books/NBK25499/#_chapter4_EFetch_
```

See Also

```
config for available 'httr' configs
```

Examples

```
## Not run:
katipo <- "Latrodectus katipo[Organism]"
katipo_search <- entrez_search(db="nuccore", term=katipo)
kaitpo_seqs <- entrez_fetch(db="nuccore", id=katipo_search$ids, rettype="fasta")
#xml
kaitpo_seqs <- entrez_fetch(db="nuccore", id=katipo_search$ids, rettype="native")
## End(Not run)</pre>
```

entrez_global_query

Find the number of records that match a given term across all NCBI Entrez databases

Description

Find the number of records that match a given term across all NCBI Entrez databases

Usage

```
entrez_global_query(term, config = NULL, ...)
```

Arguments

```
term the search term to use

config vector configuration options passed to httr::GET

additional arguments to add to the query
```

Value

a named vector with counts for each a database

entrez_info 9

See Also

```
config for available configs
```

Examples

```
## Not run:
NCBI_data_on_best_butterflies_ever <- entrez_global_query(term="Heliconius")
## End(Not run)</pre>
```

entrez_info

Get information about EUtils databases

Description

Gather information about EUtils generally, or a given Eutils database. Note: The most common uses-cases for the einfo util are finding the list of search fields available for a given database or the other NCBI databases to which records in a given database might be linked. Both these use cases are implemented in higher-level functions that return just this information (entrez_db_searchable and entrez_db_links respectively). Consequently most users will not have a reason to use this function (though it is exported by rentrez for the sake of completeness.

Usage

```
entrez_info(db = NULL, config = NULL)
```

Arguments

db character database about which to retrieve information (optional)

config config vector passed on to httr::GET

Value

XMLInternalDocument with information describing either all the databases available in Eutils (if db is not set) or one particular database (set by 'db')

See Also

```
config for available httr configurations
Other einfo: entrez_db_links(), entrez_db_searchable(), entrez_db_summary(), entrez_dbs()
```

```
## Not run:
all_the_data <- entrez_info()
XML::xpathSApply(all_the_data, "//DbName", xmlValue)
entrez_dbs()
## End(Not run)</pre>
```

10 entrez_link

entrez_link

Get links to datasets related to records from an NCBI database

Description

Discover records related to a set of unique identifiers from an NCBI database. The object returned by this function depends on the value set for the cmd argument. Printing the returned object lists the names, and provides a brief description, of the elements included in the object.

Usage

```
entrez_link(
  dbfrom,
  web_history = NULL,
  id = NULL,
  db = NULL,
  cmd = "neighbor",
  by_id = FALSE,
  config = NULL,
  ...
)
```

Arguments

dbfrom character Name of database from which the Id(s) originate

web_history a web_history object

id vector with unique ID(s) for records in database db.

db character Name of the database to search for links (or use "all" to search all databases available for db. entrez_db_links allows you to discover databases

that might have linked information (see examples).

cmd link function to use. Allowed values include

- neighbor (default). Returns a set of IDs in db linked to the input IDs in dbfrom.
- neighbor_score. As 'neighbor", but additionally returns similarity scores.
- neighbor_history. As 'neighbor', but returns web history objects.
- acheck. Returns a list of linked databases available from NCBI for a set of IDs.
- ncheck. Checks for the existence of links within a single database.
- Icheck. Checks for external (i.e. outside NCBI) links.
- Ilinks. Returns a list of external links for each ID, excluding links provided by libraries.
- llinkslib. As 'llinks' but additionally includes links provided by libraries.
- prlinks. As 'llinks' but returns only the primary external link for each ID.

by_id	logical If FALSE (default) return a single elink objects containing links for all of the provided ids. Alternatively, if TRUE return a list of elink objects, one for each ID in id.
config	vector configuration options passed to httr::GET
• • •	character Additional terms to add to the request, see NCBI documentation linked to in references for a complete list

Value

An elink object containing the data defined by the cmd argument (if by_id=FALSE) or a list of such object (if by_id=TRUE).

file XMLInternalDocument xml file resulting from search, parsed with xmlTreeParse

References

```
https://www.ncbi.nlm.nih.gov/books/NBK25499/#_chapter4_ELink_
```

See Also

```
config for available configs
entrez_db_links
```

Examples

```
## Not run:
    pubmed_search <- entrez_search(db = "pubmed", term ="10.1016/j.ympev.2010.07.013[doi]")
    linked_dbs <- entrez_db_links("pubmed")
    linked_dbs
    nucleotide_data <- entrez_link(dbfrom = "pubmed", id = pubmed_search$ids, db ="nuccore")
#Sources for the full text of the paper
    res <- entrez_link(dbfrom="pubmed", db="", cmd="llinks", id=pubmed_search$ids)
    linkout_urls(res)
## End(Not run)</pre>
```

entrez_post

Post IDs to Eutils for later use

Description

Post IDs to Eutils for later use

Usage

```
entrez_post(db, id = NULL, web_history = NULL, config = NULL, ...)
```

12 entrez_search

Arguments

db character Name of the database from which the IDs were taken

id vector with unique ID(s) for records in database db.

web_history A web_history object. Can be used to add to additional identifiers to an existing web environment on the NCBI

config vector of configuration options passed to httr::GET

character Additional terms to add to the request, see NCBI documentation linked to in references for a complete list

References

```
https://www.ncbi.nlm.nih.gov/books/NBK25499/#_chapter4_EPost_
```

See Also

config for available httr configurations

Examples

entrez_search

Search the NCBI databases using EUtils

Description

Search a given NCBI database with a particular query.

Usage

```
entrez_search(
  db,
  term,
  config = NULL,
  retmode = "xml",
  use_history = FALSE,
  ...
)
```

entrez_search 13

Arguments

db character, name of the database to search for.

term character, the search term. The syntax used in making these searches is de-

scribed in the Details of this help message, the package vignette and reference

given below.

config vector configuration options passed to httr::GET

retmode character, one of json (default) or xml. This will make no difference in most

cases.

use_history logical. If TRUE return a web_history object for use in later calls to the NCBI

... character, additional terms to add to the request, see NCBI documentation linked

to in references for a complete list

Details

The NCBI uses a search term syntax where search terms can be associated with a specific search field with square brackets. So, for instance "Homo[ORGN]" denotes a search for Homo in the "Organism" field. The names and definitions of these fields can be identified using entrez_db_searchable.

Searches can make use of several fields by combining them via the boolean operators AND, OR and NOT. So, using the search term"((Homo[ORGN] AND APP[GENE]) NOT Review[PTYP])" in PubMed would identify articles matching the gene APP in humans, and exclude review articles. More examples of the use of these search terms, and the more specific MeSH terms for precise searching, is given in the package vignette. rentrez handles special characters and URL encoding (e.g. replacing spaces with plus signs) on the client side, so there is no need to include these in search term

Therentrez tutorial provides some tips on how to make the most of searches to the NCBI. In particular, the sections on uses of the "Filter" field and MeSH terms may in formulating precise searches.

Value

ids integer Unique IDS returned by the search

count integer Total number of hits for the search

retmax integer Maximum number of hits returned by the search

web history A web history object for use in subsequent calls to NCBI

QueryTranslation character, search term as the NCBI interpreted it

file either and XMLInternalDocument xml file resulting from search, parsed with xmlTreeParse or, if retmode was set to json a list resulting from the returned JSON file being parsed with fromJSON.

https://www.ncbi.nlm.nih.gov/books/NBK25499/#_chapter4_ESearch_

See Also

config for available httr configurations

entrez_db_searchable to get a set of search fields that can be used in term for any database

14 entrez_summary

Examples

```
## Not run:
   query <- "Gastropoda[Organism] AND COI[Gene]"</pre>
   web_env_search <- entrez_search(db="nuccore", query, use_history=TRUE)</pre>
   cookie <- web_env_search$WebEnv</pre>
   qk <- web_env_search$QueryKey
   snail_coi <- entrez_fetch(db = "nuccore", WebEnv = cookie, query_key = qk,</pre>
                               file_format = "fasta", retmax = 10)
## End(Not run)
## Not run:
fly_id <- entrez_search(db="taxonomy", term="Drosophila")</pre>
#Oh, right. There is a genus and a subgenus name Drosophila...
#how can we limit this search
(tax_fields <- entrez_db_searchable("taxonomy"))</pre>
#"RANK" loots promising
tax_fields$RANK
entrez_search(db="taxonomy", term="Drosophila & Genus[RANK]")
## End(Not run)
```

entrez_summary

Get summaries of objects in NCBI datasets from a unique ID

Description

The NCBI offer two distinct formats for summary documents. Version 1.0 is a relatively limited summary of a database record based on a shared Document Type Definition. Version 1.0 summaries are only available as XML and are not available for some newer databases Version 2.0 summaries generally contain more information about a given record, but each database has its own distinct format. 2.0 summaries are available for records in all databases and as JSON and XML files. As of version 0.4, rentrez fetches version 2.0 summaries by default and uses JSON as the exchange format (as JSON object can be more easily converted into native R types). Existing scripts which relied on the structure and naming of the "Version 1.0" summary files can be updated by setting the new version argument to "1.0".

Usage

```
entrez_summary(
  db,
  id = NULL,
  web_history = NULL,
  version = c("2.0", "1.0"),
  always_return_list = FALSE,
  retmode = NULL,
  config = NULL,
  ...
)
```

entrez_summary 15

Arguments

db	character Name of the database to search for	
id	vector with unique ID(s) for records in database db. In the case of sequence databases these IDs can take form of an NCBI accession followed by a version number (eg AF123456.1 or AF123456.2)	
web_history	A web_history object	
version	either 1.0 or 2.0 see above for description	
always_return_list		
	logical, return a list of esummary objects even when only one ID is provided (see description for a note about this option)	
retmode	either "xml" or "json". By default, xml will be used for version 1.0 records, json for version 2.0.	
config	vector configuration options passed to httr::GET	

.. character Additional terms to add to the request, see NCBI documentation linked

to in references for a complete list

Details

By default, entrez_summary returns a single record when only one ID is passed and a list of such records when multiple IDs are passed. This can lead to unexpected behaviour when the results of a variable number of IDs (perhaps the result of entrez_search) are processed with an apply family function or in a for-loop. If you use this function as part of a function or script that generates a variably-sized vector of IDs setting always_return_list to TRUE will avoid these problems. The function extract_from_esummary is provided for the specific case of extracting named elements from a list of esummary objects, and is designed to work on single objects as well as lists.

Value

A list of esummary records (if multiple IDs are passed and always_return_list if FALSE) or a single record

file XMLInternalDocument xml file containing the entire record returned by the NCBI.

References

```
https://www.ncbi.nlm.nih.gov/books/NBK25499/#_chapter4_ESummary_
```

See Also

```
config for available configs
extract_from_esummary which can be used to extract elements from a list of esummary records
```

```
## Not run:
pop_ids = c("307082412", "307075396", "307075338", "307075274")
pop_summ <- entrez_summary(db="popset", id=pop_ids)
extract_from_esummary(pop_summ, "title")</pre>
```

```
# clinvar example
res <- entrez_search(db = "clinvar", term = "BRCA1", retmax=10)
cv <- entrez_summary(db="clinvar", id=res$ids)
cv
extract_from_esummary(cv, "title", simplify=FALSE)
extract_from_esummary(cv, "trait_set")[1:2]
extract_from_esummary(cv, "gene_sort")
## End(Not run)</pre>
```

extract_from_esummary Extract elements from a list of esummary records

Description

Extract elements from a list of esummary records

Usage

```
extract_from_esummary(esummaries, elements, simplify = TRUE)
```

Arguments

esummaries Either an esummary or an esummary_list (as returned by entrez_summary).

elements the names of the element to extract simplify logical, if possible return a vector

Value

List or vector containing requested elements

See Also

entrez_summary for examples of this function in action.

linkout_urls 17

linkout_urls

Extract URLs from an elink object

Description

Extract URLs from an elink object

Usage

```
linkout_urls(elink)
```

Arguments

elink

elink object (returned by entrez_link) containing Urls

Value

list of character vectors, one per ID each containing of URLs for that ID.

See Also

entrez_link

parse_pubmed_xml

Summarize an XML record from pubmed.

Description

Note: this function assumes all records are of the type "PubmedArticle" and will return an empty record for any other type (including books).

Usage

```
parse_pubmed_xml(record)
```

Arguments

record

Either and XMLInternalDocument or character the record to be parsed (expected to come from entrez_fetch)

Value

Either a single pubmed_record object, or a list of several

18 set_entrez_key

Examples

rentrez

rentrez

Description

rentrez provides functions to search for, discover and download data from the NCBI's databases using their EUtils function.

Details

Users are expected to know a little bit about the EUtils API, which is well documented: https://www.ncbi.nlm.nih.gov/books/NBK25500/

The NCBI will ban IPs that don't use EUtils within their user guidelines. In particular /enumerated /item Don't send more than three request per second (rentrez enforces this limit) /item If you plan on sending a sequence of more than ~100 requests, do so outside of peak times for the US /item For large requests use the web history method (see examples for entrez_search or use entrez_post to upload IDs)

set_entrez_key

Set the ENTREZ_KEY variable to be used by all rentrez functions

Description

The NCBI allows users to access more records (10 per second) if they register for and use an API key. This function allows users to set this key for all calls to rentrez functions during a particular R session. See the vignette section "Using API keys" for a detailed description.

Usage

```
set_entrez_key(key)
```

Arguments

key

character. Value to set ENTREZ_KEY to (i.e. your API key).

set_entrez_key 19

Value

A logical of length one, TRUE is the value was set FALSE if not. value is returned inside invisible(), i.e. it is not printed to screen when the function is called.
