## Package 'qgisprocess'

October 6, 2024

```
Title Use 'QGIS' Processing Algorithms
Version 0.4.1
Description Provides seamless access to the 'QGIS'
      (<https://qgis.org>) processing toolbox using the standalone
      'qgis_process' command-line utility. Both native and third-party
      (plugin) processing providers are supported. Beside referring data
      sources from file, also common objects from 'sf', 'terra' and 'stars'
      are supported. The native processing algorithms are documented by QGIS.org
      (2024) <a href="mailto://docs.ggis.org/latest/en/docs/user_manual/processing_algs/">manual/processing_algs/</a>>.
License GPL (>= 3)
URL https://r-spatial.github.io/qgisprocess/,
      https://github.com/r-spatial/qgisprocess
BugReports https://github.com/r-spatial/qgisprocess/issues
Depends R (>= 3.6.0)
Imports assertthat, glue, isonlite, processx (>= 3.5.2), rappdirs,
      rlang, stats, stringr, tibble, vctrs, withr
Suggests dplyr, knitr, mapview, raster, rmarkdown, rprojroot, sf,
      spDataLarge, stars, stringi, terra, testthat, tidyr
VignetteBuilder knitr
Additional_repositories https://geocompr.r-universe.dev
Config/checklist/communities inbo
Config/checklist/keywords R; package; QGIS
Encoding UTF-8
Language en-GB
RoxygenNote 7.3.2
SystemRequirements 'QGIS' latest or long-term release currently
      supported according to the 'QGIS' release schedule
      (<a href="https://www.qgis.org/en/site/getinvolved/development/roadmap.html">https://www.qgis.org/en/site/getinvolved/development/roadmap.html</a>).
      Older 'QGIS' releases are not officially supported, but may
      work since 'QGIS' 3.16.

has\_qgis 3

has_qgis	Check availability of QGIS, a plugin, a provider or an algorithm

#### **Description**

has\_qgis() checks whether the loaded qgisprocess cache is populated, which means that a QGIS installation was accessible and responsive when loading the package. qgis\_has\_plugin(), qgis\_has\_provider() and qgis\_has\_algorithm() check for the availability of one or several plugins, processing providers and algorithms, respectively. They are vectorized.

#### Usage

```
has_qgis()
qgis_has_plugin(plugin, query = FALSE, quiet = TRUE)
qgis_has_provider(provider, query = FALSE, quiet = TRUE)
qgis_has_algorithm(algorithm, query = FALSE, quiet = TRUE)
```

#### **Arguments**

plugin A plugin name (e.g., "native"). Can be a vector of names.

query Use TRUE to refresh the cached value.

quiet Use FALSE to display more information, possibly useful for debugging.

provider A provider name (e.g., "native"). Can be a vector of names.

algorithm A qualified algorithm name (e.g., "native:buffer"). Can be a vector of names.

### Value

A logical, with length 1 in case of has\_qgis().

#### Note

Only plugins that implement processing providers are supported.

## See Also

Other topics about reporting the QGIS state: qgis\_algorithms(), qgis\_path(), qgis\_using\_json\_input()

```
has_qgis()
if (has_qgis()) qgis_has_algorithm("native:filedownloader")
if (has_qgis()) qgis_has_provider("native")
if (has_qgis()) qgis_has_plugin(c("grassprovider", "processing_saga_nextgen"))
```

4 qgis\_algorithms

	-		
ggis_	alor	r1	thms

List algorithms, processing providers or plugins

#### **Description**

Functions that return metadata about the installed and enabled algorithms or processing providers, or about the installed plugins that implement processing providers. See the QGIS docs for a detailed description of the algorithms provided 'out of the box' on QGIS.

#### Usage

```
qgis_algorithms(query = FALSE, quiet = TRUE, include_deprecated = TRUE)
qgis_providers(query = FALSE, quiet = TRUE, include_deprecated = TRUE)
qgis_plugins(which = "all", query = FALSE, quiet = TRUE, ...)
```

#### **Arguments**

query Use TRUE to refresh the cached value.

quiet Use FALSE to display more information, possibly useful for debugging.

include\_deprecated

Logical. Should deprecated algorithms be included?

which String defining which plugins to select, based on their status in QGIS (enabled

or disabled). Must be one of: "all", "enabled", "disabled".

. . . Only used by other functions calling this function.

#### **Details**

The include\_deprecated argument in qgis\_algorithms() does not affect the cached value. The latter always includes deprecated algorithms if these are returned by 'qgis\_process' (this requires the JSON output method).

## Value

A tibble of algorithms, processing providers or plugins, with metadata.

## See Also

```
qgis_enable_plugins(), qgis_disable_plugins()
```

Other topics about information on algorithms & processing providers: qgis\_search\_algorithms(), qgis\_show\_help()

Other topics about reporting the QGIS state: has\_qgis(), qgis\_path(), qgis\_using\_json\_input()

qgis\_as\_raster 5

#### **Examples**

```
qgis_algorithms()
qgis_algorithms(include_deprecated = FALSE)
qgis_providers()
qgis_plugins(quiet = FALSE)
qgis_plugins(which = "disabled")
```

qgis\_as\_raster

Convert a qgis\_result object or one of its elements to a raster object

## **Description**

Convert a qgis\_result object or one of its elements to a raster object

## Usage

```
qgis_as_raster(x, ...)
qgis_as_brick(x, ...)
## S3 method for class 'qgis_outputRaster'
qgis_as_raster(x, ...)
## S3 method for class 'qgis_outputRaster'
qgis_as_brick(x, ...)
## S3 method for class 'qgis_outputLayer'
qgis_as_raster(x, ...)
## S3 method for class 'qgis_outputLayer'
qgis_as_brick(x, ...)
## S3 method for class 'qgis_result'
qgis_as_raster(x, ...)
## S3 method for class 'qgis_result'
qgis_as_brick(x, ...)
```

## Arguments

```
x A qgis_result object from qgis_run_algorithm() or a qgis_output* object from one of the qgis_extract_output() functions.
```

... Arguments passed to raster::raster() or raster::brick().

## Value

A RasterLayer or a RasterBrick object.

6 qgis\_as\_terra

#### See Also

```
Other topics about coercing processing output: qgis_as_terra(), st_as_sf, st_as_stars

Other topics about accessing or managing processing results: qgis_as_terra(), qgis_clean_result(), qgis_extract_output(), qgis_result_status(), st_as_sf, st_as_stars
```

#### **Examples**

```
# not running below examples in R CMD check to save time
result <- qgis_run_algorithm(
   "native:slope",
   INPUT = system.file("longlake/longlake_depth.tif", package = "qgisprocess")
)

# most direct approach, autoselecting a `qgis_outputRaster` type
# output from the `result` object and reading as RasterLayer:
qgis_as_raster(result)

# if you need more control, extract the needed output element first:
output_raster <- qgis_extract_output(result, "OUTPUT")
qgis_as_raster(output_raster)</pre>
```

qgis\_as\_terra

Convert a qgis\_result object or one of its elements to a terra object

#### **Description**

This function performs coercion to one of the terra classes SpatRaster, SpatVector or SpatVectorProxy (add proxy = TRUE for the latter). The distinction between SpatRaster and SpatVector is based on the output type.

## Usage

```
qgis_as_terra(x, ...)
## S3 method for class 'qgis_outputRaster'
qgis_as_terra(x, ...)
## S3 method for class 'qgis_outputLayer'
qgis_as_terra(x, ...)
## S3 method for class 'qgis_outputVector'
qgis_as_terra(x, ...)
## S3 method for class 'qgis_result'
qgis_as_terra(x, ...)
```

qgis\_as\_terra 7

## Arguments

x A qgis\_result object from qgis\_run\_algorithm() or a qgis\_output\* object from one of the qgis\_extract\_output() functions.

Arguments passed to terra::rast() or terra::vect(), depending on the output type of x (or one of its elements, if x is a qgis\_result).

#### Value

A SpatRaster, SpatVector or SpatVectorProxy object.

#### See Also

```
Other topics about coercing processing output: qgis_as_raster(), st_as_sf, st_as_stars

Other topics about accessing or managing processing results: qgis_as_raster(), qgis_clean_result(), qgis_extract_output(), qgis_result_status(), st_as_sf, st_as_stars
```

```
# not running below examples in R CMD check to save time
result <- qgis_run_algorithm(</pre>
 "native:slope",
 INPUT = system.file("longlake/longlake_depth.tif", package = "qgisprocess")
# most direct approach, autoselecting a `qgis_outputRaster` type
# output from the `result` object and reading as SpatRaster:
qgis_as_terra(result)
# if you need more control, extract the needed output element first:
output_raster <- qgis_extract_output(result, "OUTPUT")</pre>
qgis_as_terra(output_raster)
# Same holds for coercion to SpatVector
result2 <- qgis_run_algorithm(</pre>
  "native:buffer",
 INPUT = system.file("longlake/longlake.gpkg", package = "qgisprocess"),
 DISTANCE = 100
)
qgis_as_terra(result2)
output_vector <- qgis_extract_output(result2, "OUTPUT")</pre>
qgis_as_terra(output_vector)
# SpatVectorProxy:
qgis_as_terra(result2, proxy = TRUE)
```

8 qgis\_configure

qgis\_clean\_result

Clean processing results

#### **Description**

Deletes any temporary files that are defined in a qgis\_result object. These may comprise both input and output files.

## Usage

```
qgis_clean_result(x)
```

#### **Arguments**

Х

A qgis\_result object returned by qgis\_run\_algorithm().

#### Value

The qgis\_result object passed to the function is returned invisibly.

## See Also

Other topics about accessing or managing processing results: qgis\_as\_raster(), qgis\_as\_terra(), qgis\_extract\_output(), qgis\_result\_status(), st\_as\_sf, st\_as\_stars

#### **Examples**

```
result <- qgis_run_algorithm(
   "native:buffer",
   INPUT = system.file("longlake/longlake_depth.gpkg", package = "qgisprocess"),
   DISTANCE = 10
)

file.exists(qgis_extract_output(result))
qgis_clean_result(result)
file.exists(qgis_extract_output(result))</pre>
```

qgis\_configure

Configure qgisprocess

## **Description**

Run qgis\_configure() to bring the package configuration in line with QGIS and to save this configuration to a persistent cache. See the *Details* section for more information about setting the path of the 'qgis\_process' command line tool.

qgis\_configure 9

#### Usage

```
qgis_configure(quiet = FALSE, use_cached_data = FALSE)
```

#### **Arguments**

quiet Use FALSE to display more information, possibly useful for debugging. use\_cached\_data

Use the cached algorithm list and path found when configuring qgisprocess during the last session. This saves some time loading the package.

#### **Details**

The qgisprocess package is a wrapper around the 'qgis\_process' command line tool distributed with QGIS (>=3.14). Several functions use heuristics to detect the location of the 'qgis\_process' executable.

When loading the package, the configuration is automatically read from the cache with qgis\_configure(use\_cached\_data = TRUE, quiet = TRUE) in order to save time. Run qgis\_configure(use\_cached\_data = TRUE) manually to get more details.

Use qgis\_algorithms(), qgis\_providers(), qgis\_plugins(), qgis\_using\_json\_output(), qgis\_path() and qgis\_version() to inspect cache contents.

If the configuration fails or you have more than one QGIS installation, you can set options (qgisprocess.path = "path/to/qgis\_process") or the R\_QGISPROCESS\_PATH environment variable (useful on CI). On Linux the 'qgis\_process' executable is generally available on the user's PATH, on MacOS the executable is within the QGIS\*.app/Contents/MacOS/bin folder, and on Windows the executable is named qgis\_process-qgis.bat or qgis\_process-qgis-dev.bat and is located in Program Files/QGIS\*/bin or OSGeo4W(64)/bin.

### Value

```
The result of processx::run().
```

#### See Also

```
qgis_unconfigure()
qgis_path(), qgis_version()
```

Other topics about configuring QGIS and qgisprocess: qgis\_enable\_plugins(), qgis\_run()

```
# not running in R CMD check to save time
qgis_configure(use_cached_data = TRUE)

## Not run:
# package reconfiguration
# (not run in example() as it rewrites the package cache file)
qgis_configure()
```

10 qgis\_detect\_paths

```
## End(Not run)
```

 $\begin{array}{ll} {\it qgis\_detect\_paths} & {\it Detect~QGIS~installations~with~'qgis\_process'~on~Windows~and~ma-coS} \end{array}$ 

#### Description

Discovers existing 'qgis\_process' executables on the system and returns their filepath. Only available for Windows and macOS systems. qgis\_detect\_paths() is a shortcut to qgis\_detect\_windows\_paths() on Windows and qgis\_detect\_macos\_paths() on macOS.

#### Usage

```
qgis_detect_paths(drive_letter = strsplit(R.home(), ":")[[1]][1])
qgis_detect_windows_paths(drive_letter = strsplit(R.home(), ":")[[1]][1])
qgis_detect_macos_paths()
```

#### **Arguments**

drive\_letter

The drive letter on which to search. By default, this is the same drive letter as the R executable. Only applicable to Windows.

#### Value

A character vector of possible paths to the 'qgis\_process' executable.

#### Note

These functions do not verify whether the discovered 'qgis\_process' executables successfully run. You can run qgis\_path(query = TRUE, quiet = FALSE) to discover and cache the first 'qgis\_process' in the list that works.

#### See Also

```
qgis_configure(), qgis_path()
```

```
if (.Platform$0S.type == "windows") {
    qgis_detect_paths()
    identical(qgis_detect_windows_paths(), qgis_detect_paths())
}
if (Sys.info()["sysname"] == "Darwin") {
    qgis_detect_paths()
    identical(qgis_detect_macos_paths(), qgis_detect_paths())
}
```

qgis\_enable\_plugins 11

#### **Description**

Processing plugins, installed in QGIS, can be in an 'enabled' or 'disabled' state in QGIS. The plugin state can be controlled from R. qgis\_enable\_plugins() enables plugins while qgis\_disable\_plugins() does the reverse.

#### Usage

```
qgis_enable_plugins(names = NULL, quiet = FALSE)
qgis_disable_plugins(names = NULL, quiet = FALSE)
```

#### Arguments

names Optional character vector of plugin names.

quiet Use FALSE to display more information, possibly useful for debugging.

#### **Details**

The cache is immediately updated upon enabling or disabling plugins from R.

Run qgis\_plugins() to list the available plugins that implement processing providers.

If you installed, removed, enabled or disabled plugins in the QGIS GUI, then run qgis\_configure() to make those changes available in R.

If names is not provided to qgis\_enable\_plugins(), it is assumed that all *disabled* plugins are to be enabled. If names is not provided to qgis\_disable\_plugins(), it is assumed that all *enabled* plugins are to be disabled. Note that the 'processing' plugin is ignored, because it is always available to 'qgis\_process' (not QGIS though).

## Value

A tibble of plugins, invisibly.

#### Note

Only plugins that implement processing providers are supported. Installing or removing plugins is not supported.

#### See Also

```
qgis_plugins()
```

Other topics about configuring QGIS and qgisprocess: qgis\_configure(), qgis\_run()

12 qgis\_extract\_output

#### **Examples**

```
qgis_enable_plugins("name_of_plugin")
```

## Description

These functions extract one output element from the result of qgis\_run\_algorithm(), potentially more than one in the case of qgis\_extract\_output\_by\_class(). An output element can be extracted based on its name, its position in the printed qgis\_result object returned by qgis\_run\_algorithm(), or its class.

```
qgis_extract_output() is an alias to qgis_extract_output_by_name().
```

#### Usage

```
qgis_extract_output_by_name(x, name = "OUTPUT", first = TRUE)
qgis_extract_output(x, name = "OUTPUT", first = TRUE)
qgis_extract_output_by_position(x, which)
qgis_extract_output_by_class(x, class, single = TRUE)
```

#### **Arguments**

X	A qgis_result object returned by qgis_run_algorithm().
name	The name of an output.
first	Logical. Should qgis_extract_output_by_name() fall back to the first output element if the default OUTPUT or output element is not available? Only takes effect if name is equal to OUTPUT or output, but not found.
which	The index of an output.
class	Character vector of classes. At least one class must be inherited by an element of x for that element to be selected.
single	Logical. Ensures the selection of a single output in qgis_extract_output_by_class(). The OUTPUT or output element is taken if available and on condition that it inherits a specified class; otherwise falls back to the first element that inherits a specified class.

#### Value

A qgis\_output\* object.

qgis\_function 13

#### See Also

```
Other topics about accessing or managing processing results: qgis_as_raster(), qgis_as_terra(), qgis_clean_result(), qgis_result_status(), st_as_sf, st_as_stars
```

#### **Examples**

```
result <- qgis_run_algorithm(
   "native:buffer",
   INPUT = system.file("longlake/longlake_depth.gpkg", package = "qgisprocess"),
   DISTANCE = 10
)

# the print() method of a qgis_result only prints its output elements:
result

# nevertheless, more elements are included:
length(result)
names(result)

# extract the output element 'OUTPUT':
qgis_extract_output(result)</pre>
```

qgis\_function

Create a wrapper function that runs one algorithm

## **Description**

As opposed to qgis\_run\_algorithm(), qgis\_function() creates a callable function based on the argument metadata provided by qgis\_get\_argument\_specs().

#### Usage

```
qgis_function(algorithm, ...)
```

#### **Arguments**

```
algorithm A qualified algorithm name (e.g., "native:buffer").

... Algorithm arguments. These values are evaluated once and immediately, so you shouldn't call qgis_tmp_file() here.
```

## **Details**

The logic of qgis\_function() has been implemented in R package qgis. This package also provides the QGIS documentation of each processing algorithm as corresponding R function documentation.

14 qgis\_list\_input

#### Value

A function.

#### **Examples**

```
qgis_buffer <- qgis_function("native:buffer")
qgis_buffer(
   system.file(
    "longlake/longlake_depth.gpkg",
    package = "qgisprocess"
   ),
   DISTANCE = 10
)</pre>
```

qgis\_list\_input

Prepare a compound input argument

## Description

Some algorithm arguments require a compound object, consisting of several layers or elements. These functions apply strict validation rules when generating this object and are recommended.

#### Usage

```
qgis_list_input(...)
qgis_dict_input(...)
```

#### **Arguments**

... Named values for qgis\_dict\_input() or unnamed values for qgis\_list\_input().

#### **Details**

qgis\_list\_input() generates an unnamed list of class qgis\_list\_input. The use of qgis\_list\_input() instead of list() is *required* for compound arguments *in case of no-JSON input* (see qgis\_using\_json\_input()). Since it applies strict validation rules, it is recommended in all cases though.

qgis\_dict\_input() generates a named list of class qgis\_dict\_input. qgis\_dict\_input() is only supported when the JSON input method applies (see qgis\_using\_json\_input()), where it can be interchanged with a named list(). It can only be used for arguments requiring *named* lists. Since it applies strict validation rules, it is recommended above list().

Some QGIS argument types that need a compount object are the multilayer, aggregates, fields\_mapping, tininputlayers and vectortilewriterlayers argument types.

qgis\_path 15

## Value

- qgis\_list\_input(): An object of class 'qgis\_list\_input'
- qgis\_dict\_input(): An object of class 'qgis\_dict\_input'

## **Examples**

```
qgis_list_input(1, 2, 3)
qgis_dict_input(a = 1, b = 2, c = 3)
```

qgis\_path

Get metadata about the used 'qgis\_process' command

## Description

<code>qgis\_path()</code> returns the filepath of the 'qgis\_process' command, while <code>qgis\_version()</code> returns the QGIS version.

## Usage

```
qgis_path(query = FALSE, quiet = TRUE)
qgis_version(query = FALSE, quiet = TRUE, full = TRUE, debug = FALSE)
```

## **Arguments**

qι	uery	Use TRUE to refresh the cached value.
qı	uiet	Use FALSE to display more information, possibly useful for debugging.
fı	ull	Logical. If FALSE, only return the "x.y.z" version string instead of the full version string that includes the name. Defaults to TRUE; ignored if debug = TRUE.
de	ebug	Logical. If TRUE, also output the version of QGIS, the operating system and all relevant libraries, as reported by the 'qgis_process' command.

#### Value

A string.

## See Also

```
qgis_configure()
```

Other topics about reporting the QGIS state: has\_qgis(), qgis\_algorithms(), qgis\_using\_json\_input()

16 qgis\_result\_status

#### **Examples**

```
qgis_path()
qgis_path(quiet = FALSE)
qgis_version()
qgis_version(full = FALSE)
qgis_version(debug = TRUE)
```

qgis\_result\_status

Access processing results: extra tools

## Description

A qgis\_result object is a list that, next to the output elements, also contains other elements that can be useful in scripting. Several of these can be extracted with convenience functions: the exit status of the process, standard output and standard error of 'qgis\_process', arguments passed to 'qgis\_process'.

## Usage

```
qgis_result_status(x)
qgis_result_stdout(x)
qgis_result_stderr(x)
qgis_result_args(x)
```

#### **Arguments**

Х

A qgis\_result object returned by qgis\_run\_algorithm().

#### Value

- A number in case of qgis\_result\_status().
- A string in case of qgis\_result\_stdout() and qgis\_result\_stderr().
- A list in case of qgis\_result\_args().

## See Also

```
Other topics about programming or debugging utilities: qgis_run(), qgis_tmp_file(), qgis_unconfigure(), qgis_using_json_input()

Other topics about accessing or managing processing results: qgis_as_raster(), qgis_as_terra(), qgis_clean_result(), qgis_extract_output(), st_as_sf, st_as_stars
```

qgis\_run 17

#### **Examples**

```
result <- qgis_run_algorithm(
   "native:buffer",
   INPUT = system.file("longlake/longlake_depth.gpkg", package = "qgisprocess"),
   DISTANCE = 10
)

qgis_result_status(result)
stdout <- qgis_result_stdout(result)
cat(substr(stdout, 1, 335))
qgis_result_stderr(result)
qgis_result_args(result)</pre>
```

qgis\_run

Call the 'qgis\_process' command directly

#### **Description**

qgis\_run() offers full access to 'qgis\_process'. Run cat(qgis\_run("--help")\$stdout) to get the command's help.

#### Usage

```
qgis_run(args = character(), ..., env = qgis_env(), path = qgis_path())
```

#### **Arguments**

args	Command-line arguments
	Passed to processx::run().
env	A list() of environment variables. Defaults to getOption("qgisprocess.env", list(QT_QPA_PLATFORM = "offscreen")).
path	A path to the 'qgis_process' executable. Defaults to qgis_path().

## Value

A processx::run() return value, i.e. a list with status, stdout, stderr and timeout elements.

## See Also

```
Other topics about programming or debugging utilities: qgis_result_status(), qgis_tmp_file(), qgis_unconfigure(), qgis_using_json_input()

Other topics about configuring QGIS and qgisprocess: qgis_configure(), qgis_enable_plugins()
```

```
processx_list <- qgis_run(args = "--help")
cat(processx_list$stdout)</pre>
```

18 qgis\_run\_algorithm

qgis\_run\_algorithm

Run an algorithm using 'qgis\_process'

#### **Description**

Runs an algorithm using 'qgis\_process'. See the QGIS docs for a detailed description of the algorithms provided 'out of the box' on QGIS.

#### Usage

```
qgis_run_algorithm(
   algorithm,
   ...,
   PROJECT_PATH = NULL,
   ELLIPSOID = NULL,
   .raw_json_input = NULL,
   .quiet = TRUE
)
```

#### **Arguments**

algorithm A qualified algorithm name (e.g., "native:buffer") or a path to a QGIS model file.

... Named key-value pairs as arguments for the algorithm. Features of rlang::list2() are supported. These arguments are converted to strings using as\_qgis\_argument().

PROJECT\_PATH, ELLIPSOID
Global values for QGIS project file and ellipsoid name for distance calculations.

.raw\_json\_input
The raw JSON to use as input in place of .... See Details section.

.quiet Use FALSE to get extra output from 'qgis\_process'. This can be useful in debugging.

#### **Details**

qgis\_run\_algorithm() accepts various R objects as algorithm arguments. An overview is given by vignette("qgis\_arguments"). Examples include an R matrix or data frame for the argument type 'matrix', R colors for the argument type 'color', sf or terra (SpatVector) objects for the argument type 'vector' and raster/terra/stars objects for the argument type 'raster', but there are many more. qgis\_run\_algorithm() preprocesses the provided objects into the format that QGIS expects for a given argument.

Providing R objects that cannot be converted to the applicable argument type will lead to an error.

Algorithm arguments can be passed as arguments of qgis\_run\_algorithm(), but they can also be combined as a JSON string and fed into the .raw\_json\_input argument. A JSON string can be obtained from the QGIS GUI, either from the processing tool dialog or from the processing history dialog, by selecting 'Copy as JSON' in the 'Advanced' dropdown menu. So a user can first try out

qgis\_run\_algorithm\_p 19

a geoprocessing step in the QGIS GUI, and once the chosen algorithm arguments are satisfactory, copy the JSON string to reproduce the operation in R. A screenshot is available at the package homepage.

#### Value

A qgis\_result object.

#### Running QGIS models and Python scripts

QGIS models and Python scripts can be added to the Processing Toolbox in the QGIS GUI, by pointing at their corresponding file. This will put the model or script below the provider 'Models' or 'Scripts', respectively. Next, it is necessary to run qgis\_configure() in R in order to make the model or script available to qgisprocess (even reloading the package won't detect it, since these providers have dynamic content, not tied to a plugin or to a QGIS version). You can check the outcome with qgis\_providers() and qgis\_search\_algorithms(). Now, just as with other algorithms, you can provide the model:<name> or script:<name> identifier to the algorithm argument of qgis\_run\_algorithm().

As the output argument name of a QGIS model can have an R-unfriendly syntax, you may need to take the JSON parameter string from the QGIS processing dialog and feed the JSON string to the .raw\_json\_input argument of qgis\_run\_algorithm() instead of providing separate arguments.

Although the 'qgis\_process' backend also supports replacing the 'algorithm' parameter by the file path of a model file or a Python script, it is not planned to implement this in qgisprocess, as it would bypass argument preprocessing in R (including checks).

#### See Also

```
vignette("qgis_arguments")
Other functions to run one geoprocessing algorithm: qgis_run_algorithm_p()
```

### **Examples**

```
qgis_run_algorithm(
   "native:buffer",
   INPUT = system.file("longlake/longlake_depth.gpkg", package = "qgisprocess"),
   DISTANCE = 10
)
```

qgis\_run\_algorithm\_p Run an algorithm using 'qgis\_process': pipe-friendly wrapper

#### **Description**

qgis\_run\_algorithm\_p() wraps qgis\_run\_algorithm(), passing its first argument to the first argument of the QGIS algorithm. This makes it more convenient in a pipeline (hence '\_p' in the name).

## Usage

```
qgis_run_algorithm_p(
   .data,
   algorithm,
   ...,
   .select = "OUTPUT",
   .clean = TRUE,
   .quiet = TRUE
)
```

## **Arguments**

.data	Passed to the first input of algorithm. If .data is a qgis_result (the result of a previous processing step), .data[[.select]] is passed instead.
algorithm	A qualified algorithm name (e.g., "native:buffer").
•••	Other algorithm arguments. These values are evaluated once and immediately, so you shouldn't call qgis_tmp_file() here.
.select	String. The name of the element to select from .data if the latter is a qgis_result. Defaults to "OUTPUT".
.clean	Logical. Should an incoming qgis_result be cleaned (using qgis_clean_result()) after processing?
.quiet	Use FALSE to get extra output from 'qgis_process'. This can be useful in debugging.

#### **Details**

Uses qgis\_function() under the hood.

#### Value

A qgis\_result object.

## See Also

Other functions to run one geoprocessing algorithm: qgis\_run\_algorithm()

```
system.file(
  "longlake/longlake_depth.gpkg",
  package = "qgisprocess"
) |>
  qgis_run_algorithm_p(
    "native:buffer",
    DISTANCE = 10
)
```

qgis\_search\_algorithms

```
qgis_search_algorithms
```

Search geoprocessing algorithms

#### **Description**

Searches for algorithms using a regular expression. In its simplest form that is just a string that must match part of a character value.

## Usage

```
qgis_search_algorithms(
  algorithm = NULL,
  provider = NULL,
  group = NULL,
  include_deprecated = FALSE
)
```

#### **Arguments**

algorithm Regular expression to match the algorithm or algorithm\_title value from

the output of qgis\_algorithms().

provider Regular expression to match the provider or provider\_title value from the

output of qgis\_algorithms().

group Regular expression to match the group value from the output of qgis\_algorithms().

include\_deprecated

Logical. Should deprecated algorithms be included?

#### **Details**

When using multiple arguments in combination, only the algorithms are returned that fulfill all conditions.

All regular expressions that stringr::str\_detect() can handle, are accepted. Have a look at stringi::search\_regex() to get a nice overview.

#### Value

A tibble.

#### See Also

Other topics about information on algorithms & processing providers: qgis\_algorithms(), qgis\_show\_help()

22 qgis\_show\_help

#### **Examples**

```
qgis_search_algorithms(
  algorithm = "point.*line",
  provider = "^native$"
)
```

qgis\_show\_help

Get detailed information about one algorithm

## Description

Get detailed information about one algorithm

## Usage

```
qgis_show_help(algorithm)

qgis_get_description(algorithm)

qgis_get_argument_specs(algorithm, ...)

qgis_get_output_specs(algorithm, ...)
```

## Arguments

```
algorithm A qualified algorithm name (e.g., "native:buffer"). . . . For internal use only.
```

#### Value

- qgis\_get\_description(): a string.
- qgis\_get\_argument\_specs(), qgis\_get\_output\_specs(): a tibble.
- qgis\_show\_help(): the algorithm name, invisibly.

#### See Also

```
qgis_get_description("native:filedownloader")
# not running below examples in R CMD check to save time
qgis_get_argument_specs("native:filedownloader")
qgis_get_output_specs("native:filedownloader")
qgis_show_help("native:filedownloader")
```

qgis\_tmp\_file 23

qgis\_tmp\_file

Manage temporary files

## **Description**

These functions create temporary files that can be used in calls to qgis\_run\_algorithm() or elsewhere. These files are created in a special temporary directory (qgis\_tmp\_base()) that should be periodically cleaned up using qgis\_clean\_tmp(). You can set your preferred vector and/or raster file extension using options(qgisprocess.tmp\_vector\_ext = "...") and/or options(qgisprocess.tmp\_raster\_ext = "..."), respectively.

#### Usage

```
qgis_tmp_file(ext)
qgis_tmp_folder()
qgis_tmp_vector(ext = getOption("qgisprocess.tmp_vector_ext", ".gpkg"))
qgis_tmp_raster(ext = getOption("qgisprocess.tmp_raster_ext", ".tif"))
qgis_tmp_base()
qgis_clean_tmp()
```

## **Arguments**

ext

The file extension to be used.

#### Value

A character vector indicating the location of a (not yet created) temporary file.

#### See Also

```

```

```
qgis_tmp_base()
qgis_tmp_file(".csv")
qgis_tmp_vector()
qgis_tmp_raster()
```

qgis\_unconfigure

Clean the package cache

#### **Description**

Empties the qgisprocess cache environment.

## Usage

```
qgis_unconfigure()
```

## Value

NULL, invisibly.

## See Also

```
Other topics about programming or debugging utilities: qgis_result_status(), qgis_run(), qgis_tmp_file(), qgis_using_json_input()
```

## **Examples**

```
## Not run:
# not running this function in example() as it clears the cache environment.
qgis_unconfigure()

## End(Not run)

# undoing qgis_unconfigure() by repopulating the cache environment from file:

# not running in R CMD check to save time
qgis_configure(use_cached_data = TRUE)
```

qgis\_using\_json\_input Report if JSON objects are used for input to and output from 'qgis\_process'

## Description

Returns a logical that reveals whether the JSON input and output methods are used, respectively.

## Usage

```
qgis_using_json_input()
qgis_using_json_output(query = FALSE, quiet = TRUE)
```

#### **Arguments**

query

Logical. Should the outcome of qgis\_using\_json\_output() ignore the cached value? The argument has effect on condition that no user setting 'use\_json\_output' is in place (see Details).

- If set as TRUE, the function simply returns TRUE and the cached value for the current session is set as TRUE.
- If set as FALSE (default), the function returns the cached value on condition that it does not conflict with a 'use\_json\_input' user setting.

quiet

Use FALSE to display more information, possibly useful for debugging.

#### **Details**

Since QGIS 3.24 the JSON input method of 'qgis\_process' is used by default when calling the command. It allows to use certain algorithms that require a more complex input argument, e.g. a list of lists (see qgis\_list\_input()).

Likewise, JSON output is the default output format requested from 'qgis\_process'. Using the JSON input method of 'qgis\_process' automatically implies using the JSON output method; when *not* using the JSON input method it is possible (but not the default) to also not use the JSON output method.

The defaults can be overruled with the options qgisprocess.use\_json\_input or qgisprocess.use\_json\_output, and with the environment variables R\_QGISPROCESS\_USE\_JSON\_INPUT or R\_QGISPROCESS\_USE\_JSON\_OUTPUT.

The returned JSON output method is always cached during the current session by qgis\_using\_json\_output(). Given that qgis\_using\_json\_output() is called by various functions in the package, having a user setting 'use\_json\_output' in place (see above) will have effect during subsequent usage of the package. To cache the value between sessions, qgis\_configure() needs to be called to update the value stored in the persistent package cache file.

The JSON input method is not cached but simply determined on the fly, based on QGIS version, the JSON output method and the user setting if present.

There is good reason for having 'use\_json\_output' in the persistent package cache: the values of qgis\_algorithms() and qgis\_plugins() are different with or without the JSON output method, and are also stored in the cache.

#### Value

A logical of length 1.

st\_as\_sf

Convert a qgis\_result object or one of its elements to an sf object

#### Description

Convert a qgis\_result object or one of its elements to an sf object

## Usage

```
## $3 method for class 'qgis_result'
st_as_sf(x, ...)
## $3 method for class 'qgis_outputVector'
st_as_sf(x, ...)
## $3 method for class 'qgis_outputLayer'
st_as_sf(x, ...)
```

## **Arguments**

A qgis\_result object from qgis\_run\_algorithm() or a qgis\_output\* object from one of the qgis\_extract\_output() functions.
 Arguments passed to sf::read\_sf().

#### **Details**

The sf package must be loaded explicitly to use these methods.

#### Value

An sf object.

#### See Also

```

```
# not running below examples in R CMD check to save time
result <- qgis_run_algorithm(
   "native:buffer",
   INPUT = system.file("longlake/longlake_depth.gpkg", package = "qgisprocess"),
   DISTANCE = 10
)</pre>
```

st\_as\_stars 27

```
# most direct approach, autoselecting a `qgis_outputVector` type
# output from the `result` object and reading as sf object:
sf::st_as_sf(result)

# if you need more control, extract the needed output element first:
output_vector <- qgis_extract_output(result, "OUTPUT")
sf::st_as_sf(output_vector)</pre>
```

st\_as\_stars

Convert a qgis\_result object or one of its elements to a stars object

## Description

Convert a qgis\_result object or one of its elements to a stars object

#### Usage

```
## S3 method for class 'qgis_outputRaster'
st_as_stars(x, ...)
## S3 method for class 'qgis_outputLayer'
st_as_stars(x, ...)
## S3 method for class 'qgis_result'
st_as_stars(x, ...)
```

## Arguments

x A qgis\_result object from qgis\_run\_algorithm() or a qgis\_output\* object from one of the qgis\_extract\_output() functions.

... Arguments passed to stars::read\_stars().

#### **Details**

The stars package must be loaded explicitly to use these methods.

#### Value

A stars or a stars\_proxy object.

#### See Also
