# Package 'pharmr'

December 4, 2024

```
Encoding UTF-8
Version 1.4.0
Date 2024-12-04
Title Interface to the 'Pharmpy' 'Pharmacometrics' Library
Maintainer Rikard Nordgren < rikard.nordgren@farmaci.uu.se>
Depends R (>= 3.6.0), altair (>= 4.0.0)
SystemRequirements Python (>= 3.11.0)
Imports reticulate (>= 1.19), utils
Suggests testthat, magrittr, here, knitr
NeedsCompilation no
Description Interface to the 'Pharmpy' 'pharmacometrics' library. The 'Reticulate' pack-
      age is used to interface Python from R.
Config/reticulate list( packages = list( list(package = ``altair"),
      list(package = ``pharmpy-core") ) )

# Description

Add an admid column to the model dataset and datainfo. Dependent on the presence of a CMT column in order to add admid correctly.

When generated, admids of events in between doses is set to the last used admid.

### Usage

```
add_admid(model)
```

# Arguments

model (Model) Pharmpy model

8 add\_allometry

#### Value

```
(model: Model) Pharmpy model
```

#### See Also

```
get_admid : Get or create an admid column
get_cmt : Get or create a cmt column
```

add\_allometry

add\_allometry

#### **Description**

Add allometric scaling of parameters

Add an allometric function to each listed parameter. The function will be  $P=P^*(X/Z)^{**}T$  where P is the parameter, X the allometric\_variable, Z the reference\_value and T is a theta. Default is to automatically use clearance and volume parameters.

If there already exists a covariate effect (or allometric scaling) on a parameter with the specified allometric variable, nothing will be added.

If no allometric variable is specified, it will be extracted from the dataset based on the descriptor "body weight".

#### Usage

```
add_allometry(
  model,
  allometric_variable = NULL,
  reference_value = 70,
  parameters = NULL,
  initials = NULL,
  lower_bounds = NULL,
  upper_bounds = NULL,
  fixed = TRUE
)
```

#### **Arguments**

add\_bioavailability 9

 $initials \qquad \qquad (array(numeric)\ (optional))\ Initial\ estimates\ for\ the\ exponents.\ Default\ is\ to\ use$ 

 $0.75\ for\ CL$  and Qs and  $1\ for\ Vs$ 

lower\_bounds (array(numeric) (optional)) Lower bounds for the exponents. Default is 0 for all

parameters

upper\_bounds (array(numeric) (optional)) Upper bounds for the exponents. Default is 2 for all

parameters

fixed (logical) Whether the exponents should be fixed

#### Value

(Model) Pharmpy model object

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- remove_covariate_effect(model, 'CL', 'WGT')
model <- remove_covariate_effect(model, 'V', 'WGT')
model <- add_allometry(model, allometric_variable='WGT')
model$statements$before_odes
## End(Not run)</pre>
```

```
add_bioavailability add_bioavailability
```

#### **Description**

Add bioavailability statement for the first dose compartment of the model. Can be added as a new parameter or otherwise it will be set to 1. If added as a parameter, a logit transformation can also be applied.

#### Usage

```
add_bioavailability(model, add_parameter = TRUE, logit_transform = FALSE)
```

#### **Arguments**

```
model (Model) Pharmpy model
add_parameter (logical) Add new parameter representing bioavailability or not
logit_transform
(logical) Logit transform the added bioavailability parameter.
```

#### Value

```
(Model) Pharmpy model object
```

10 add\_cmt

#### See Also

```
remove_bioavailability
```

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- add_bioavailability(model)
## End(Not run)</pre>
```

add\_cmt

add\_cmt

### **Description**

Add a CMT column to the model dataset and datainfo if not existed

In case of multiple doses, this method is dependent on the presence of an admid column to correctly number each dose.

NOTE: Existing CMT is based on datainfo type being set to 'compartment' and a column named 'CMT' can be replaced

### Usage

```
add_cmt(model)
```

# Arguments

model

(Model) Pharmpy model

#### Value

```
(model: Model) Pharmpy model
```

# See Also

get\_admid : Get or create an admid column

get\_cmt : Get or create a cmt column

add\_covariate\_effect 11

 $add\_covariate\_effect$   $add\_covariate\_effect$ 

# Description

Adds covariate effect to :class:pharmpy.model.

The following effects have templates:

- Linear function for continuous covariates (lin)
- Function:

(equation could not be rendered, see API doc on website)

- Init: 0.001
- Upper:
- If median of covariate equals minimum: 100,000
- Otherwise: (equation could not be rendered, see API doc on website)
- Lower:
- If median of covariate equals maximum: -100,000
- Otherwise: (equation could not be rendered, see API doc on website)
- Linear function for categorical covariates (cat)
- Function:
- If covariate is the most common category:

(equation could not be rendered, see API doc on website)

• For each additional category:

(equation could not be rendered, see API doc on website)

- Init: 0.001
- Upper: 5
- Lower: -1
- (alternative) Linear function for categorical covariates (cat2)
- Function:
- If covariate is the most common category:

(equation could not be rendered, see API doc on website)

• For each additional category:

(equation could not be rendered, see API doc on website)

- Init: 0.001
- Upper: 6

12 add\_covariate\_effect

- Lower: 0
- Piecewise linear function/"hockey-stick", continuous covariates only (piece\_lin)
- Function:
- If cov <= median:

(equation could not be rendered, see API doc on website)

• If cov > median:

(equation could not be rendered, see API doc on website)

- Init: 0.001
- Upper:
- For first state: (equation could not be rendered, see API doc on website)
- Otherwise: 100,000
- Lower:
- For first state: -100,000
- Otherwise: (equation could not be rendered, see API doc on website)
- Exponential function, continuous covariates only (exp)
- Function:

(equation could not be rendered, see API doc on website)

- Init:
- If lower > 0.001 or upper < 0.001: (equation could not be rendered, see API doc on website)
- If estimated init is 0: (equation could not be rendered, see API doc on website)
- Otherwise: 0.001
- Upper:
- If min median = 0 or max median = 0: 100
- Otherwise:

(equation could not be rendered, see API doc on website)

- Lower:
- If min median = 0 or max median = 0: 0.01
- Otherwise:

(equation could not be rendered, see API doc on website)

- Power function, continuous covariates only (pow)
- Function:

(equation could not be rendered, see API doc on website)

• Init: 0.001

Upper: 100,000Lower: -100

add\_derivative 13

#### Usage

```
add_covariate_effect(
  model,
  parameter,
  covariate,
  effect,
  operation = "*",
  allow_nested = FALSE
)
```

#### **Arguments**

model (Model) Pharmpy model to add covariate effect to.
parameter (str) Name of parameter to add covariate effect to.

covariate (str) Name of covariate.

effect (str) Type of covariate effect. May be abbreviated covariate effect (see above)

or custom.

operation (str) Whether the covariate effect should be added or multiplied (default).

allow\_nested (logical) Whether to allow adding a covariate effect when one already exists for

the input parameter-covariate pair.

#### Value

(Model) Pharmpy model object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- add_covariate_effect(model, "CL", "APGR", "exp")
model$statements$before_odes$full_expression("CL")
## End(Not run)</pre>
```

add\_derivative

add\_derivative

### Description

Add a derivative to be calculcated when running the model. Currently, only derivatives with respect to the prediction is supported. Default is to add all possible ETA and EPS derivatives. First order derivates are specied either by single string or single-element tuple. For instance with\_respect\_to = "ETA\_1" or with\_respect\_to = ("ETA\_1",)

Second order derivatives are specified by giving the two independent varibles in a tuple of tuples. For instance with\_respect\_to ((ETA\_1, EPS\_1),)

Multiple derivatives can be specified within a tuple. For instance ((ETA\_1, EPS\_1), "ETA\_1") Currently, only ETAs and EPSILONs are supported

#### Usage

```
add_derivative(model, with_respect_to = NULL)
```

### **Arguments**

```
model (Model) Pharmpy modeas.

with_respect_to

(array(array(str) or str) or str (optional)) Parameter name(s) to use as independent variables. Default is NULL.
```

#### Value

(Pharmpy model.)

```
add\_effect\_compartment
```

add\_effect\_compartment

### **Description**

Add an effect compartment.

Implemented PD models are:

• Linear:

(equation could not be rendered, see API doc on website)

• Emax:

(equation could not be rendered, see API doc on website)

• Step effect:

(equation could not be rendered, see API doc on website)

• Sigmoidal:

(equation could not be rendered, see API doc on website)

• Log-linear:

```
(equation could not be rendered, see API doc on website)
(equation could not be rendered, see API doc on website)
```

#### Usage

```
add_effect_compartment(model, expr)
```

add\_estimation\_step 15

### **Arguments**

model (Model) Pharmpy model

expr (str) Name of the PD effect function.

#### Value

(Model) Pharmpy model object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- add_effect_compartment(model, "linear")
model$statements$ode_system$find_compartment("EFFECT")
## End(Not run)</pre>
```

add\_estimation\_step

### **Description**

Add estimation step

Adds estimation step for a model in a given index. Methods currently supported are: FO, FOCE, ITS, LAPLACE, IMPMAP, IMP, SAEM

#### Usage

```
add_estimation_step(model, method, idx = NULL, ...)
```

### **Arguments**

model (Model) Pharmpy model

method (str) estimation method to change to

idx (numeric (optional)) index of estimation step (starting from 0), default is NULL

(adds step at the end)

... Arguments to pass to EstimationStep (such as interaction, evaluation)

#### Value

(Model) Pharmpy model object

16 add\_iiv

#### See Also

```
set_estimation_step
remove_estimation_step
append_estimation_step_options
add_parameter_uncertainty_step
remove_parameter_uncertainty_step
set_evaluation_step
```

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
opts <- list('NITER'=1000, 'ISAMPLE'=100)
model <- add_estimation_step(model, 'IMP', tool_options=opts)
ests <- model$execution_steps
length(ests)
ests[2]
## End(Not run)</pre>
```

add\_iiv

add\_iiv

#### Description

Adds IIVs to :class:pharmpy.model.

Effects that currently have templates are:

- Additive (add)
- Proportional (prop)
- Exponential (exp)
- Logit (log)
- Rescaled logit (re\_log)

For all except exponential the operation input is not needed. Otherwise user specified input is supported. Initial estimates for new etas are 0.09.

Assuming a statement (equation could not be rendered, see API doc on website)

- Additive: (equation could not be rendered, see API doc on website)
- Proportional: (equation could not be rendered, see API doc on website)
- Exponential: (equation could not be rendered, see API doc on website)
- Logit: (equation could not be rendered, see API doc on website)
- Rescaled logit: (equation could not be rendered, see API doc on website) with (equation could not be rendered, see API doc on website)

add\_iiv

### Usage

```
add_iiv(
  model,
  list_of_parameters,
  expression,
  operation = "*",
  initial_estimate = 0.09,
  eta_names = NULL
)
```

### **Arguments**

#### Value

(Model) Pharmpy model object

### See Also

```
add_pk_iiv
add_iov
remove_iiv
remove_iov
```

```
## Not run:
model <- load_example_model("pheno")
model <- remove_iiv(model, "CL")
model <- add_iiv(model, "CL", "add")
model$statements$find_assignment("CL")
## End(Not run)</pre>
```

18 add\_indirect\_effect

add\_indirect\_effect add\_indirect\_effect

### **Description**

Add indirect (turnover) effect

The concentration (equation could not be rendered, see API doc on website)

• Production:

(equation could not be rendered, see API doc on website)

• Degradation:

(equation could not be rendered, see API doc on website)

(equation could not be rendered, see API doc on website) Baseline (equation could not be rendered, see API doc on website)

Models:

• Linear:

(equation could not be rendered, see API doc on website)

• Emax:

(equation could not be rendered, see API doc on website)

• Sigmoidal:

(equation could not be rendered, see API doc on website)

### Usage

```
add_indirect_effect(model, expr, prod = TRUE)
```

### **Arguments**

model (Model) Pharmpy model

expr (str) Production (TRUE) (default) or degradation (FALSE)

prod (logical) Name of PD effect function.

#### Value

(Model) Pharmpy model object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- add_indirect_effect(model, expr='linear', prod=TRUE)
## End(Not run)</pre>
```

add\_individual\_parameter

add\_individual\_parameter

### Description

Add an individual or pk parameter to a model

### Usage

```
add_individual_parameter(model, name)
```

# Arguments

model (Model) Pharmpy model

name (str) Name of individual/pk parameter

#### Value

(Model) Pharmpy model object

```
## Not run:
model <- load_example_model("pheno")
model <- add_individual_parameter(model, "KA")
model$statements$find_assignment("KA")
## End(Not run)</pre>
```

20 add\_iov

add\_iov

add\_iov

### **Description**

Adds IOVs to :class:pharmpy.model.

Initial estimate of new IOVs are 10% of the IIV eta it is based on.

#### Usage

```
add_iov(
  model,
  occ,
  list_of_parameters = NULL,
  eta_names = NULL,
  distribution = "disjoint"
)
```

#### **Arguments**

model (Model) Pharmpy model to add new IOVs to.

occ (str) Name of occasion column.

list\_of\_parameters

(array(str) or str (optional)) List of names of parameters and random variables.

Accepts random variable names, parameter names, or a mix of both.

eta\_names (array(str) or str (optional)) Custom names of new etas. Must be equal to the

number of input etas times the number of categories for occasion.

distribution (str) The distribution that should be used for the new etas. Options are 'disjoint'

for disjoint normal distributions, 'joint' for joint normal distribution, 'explicit' for an explicit mix of joint and disjoint distributions, and 'same-as-iiv' for copy-

ing the distribution of IIV etas.

### Value

(Model) Pharmpy model object

### See Also

```
add_iiv
add_pk_iiv
remove_iiv
remove_iov
```

add\_lag\_time 21

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- add_iov(model, "TIME", "CL")
model$statements$find_assignment("CL")
## End(Not run)</pre>
```

add\_lag\_time

add\_lag\_time

# Description

Add lag time to the dose compartment of model.

Initial estimate for lag time is set the previous lag time if available, otherwise it is set to the time of first observation/2.

### Usage

```
add_lag_time(model)
```

### **Arguments**

mode1

(Model) Pharmpy model

### Value

(Model) Pharmpy model object

#### See Also

```
set_transit_compartments remove_lag_time
```

```
## Not run:
model <- load_example_model("pheno")
model <- add_lag_time(model)
## End(Not run)</pre>
```

add\_metabolite add\_metabolite

### **Description**

Adds a metabolite compartment to a model

The flow from the central compartment to the metabolite compartment will be unidirectional.

Presystemic indicate that the metabolite compartment will be directly connected to the DEPOT. If a depot compartment is not present, one will be created.

### Usage

```
add_metabolite(model, drug_dvid = 1, presystemic = FALSE)
```

#### **Arguments**

model (Model) Pharmpy model

drug\_dvid (numeric) DVID for drug (assuming all other DVIDs being for metabolites)

presystemic (logical) Decide wether or not to add metabolite as a presystemetic fixed drug.

#### Value

(Model) Pharmpy model object

# Examples

```
## Not run:
model <- load_example_model("pheno")
model <- add_metabolite(model)
## End(Not run)</pre>
```

#### **Description**

Adds parameter uncertainty step to the final estimation step

#### Usage

```
add_parameter_uncertainty_step(model, parameter_uncertainty_method)
```

add\_pd\_iiv 23

### **Arguments**

```
model (Model) Pharmpy model
parameter_uncertainty_method
(str) Parameter uncertainty method to use
```

#### Value

```
(Model) Pharmpy model object
```

#### See Also

```
add_estimation_step
set_estimation_step
remove_estimation_step
append_estimation_step_options
remove_parameter_uncertainty_step
set_evaluation_step
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_estimation_step(model, 'FOCE', parameter_uncertainty_method=NULL)
model <- add_parameter_uncertainty_step(model, 'SANDWICH')
ests <- model$execution_steps
ests[1]
## End(Not run)</pre>
```

add\_pd\_iiv

add\_pd\_iiv

### Description

Adds IIVs to all PD parameters in :class:pharmpy.model.

#### Usage

```
add_pd_iiv(model, initial_estimate = 0.09)
```

#### **Arguments**

```
model (Model) Pharmpy model to add new IIVs to.

initial_estimate

(numeric) Value of initial estimate of parameter. Default is 0.09
```

#### Value

(Model) Pharmpy model object

#### See Also

```
add_iiv
add_iov
remove_iiv
remove_iov
```

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_direct_effect(model, 'emax')
model$statements$find_assignment("EC_50")
model <- add_pd_iiv(model)
model$statements$find_assignment("EC_50")
## End(Not run)</pre>
```

### **Description**

Add a peripheral distribution compartment to model

The rate of flow from the central to the peripheral compartment will be parameterized as QPn / VC where VC is the volume of the central compartment. The rate of flow from the peripheral to the central compartment will be parameterized as QPn / VPn where VPn is the volumne of the added peripheral compartment.

If name is set, the peripheral compartment will be added to the compartment with the specified name instead.

Initial estimates:

# Usage

```
add_peripheral_compartment(model, name = NULL)
```

add\_pk\_iiv 25

### **Arguments**

model (Model) Pharmpy model

name (str) Name of compartment to add peripheral to.

#### Value

```
(Model) Pharmpy model object
```

#### See Also

```
set_peripheral_compartment
remove_peripheral_compartment
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- add_peripheral_compartment(model)
model$statements$ode_system
## End(Not run)</pre>
```

add\_pk\_iiv

add\_pk\_iiv

### **Description**

Adds IIVs to all PK parameters in :class:pharmpy.model.

Will add exponential IIVs to all parameters that are included in the ODE.

### Usage

```
add_pk_iiv(model, initial_estimate = 0.09)
```

# **Arguments**

```
model (Model) Pharmpy model to add new IIVs to.

initial_estimate

(numeric) Value of initial estimate of parameter. Default is 0.09
```

#### Value

(Model) Pharmpy model object

### See Also

```
add_iiv
add_iov
remove_iiv
remove_iov
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_first_order_absorption(model)
model$statements$find_assignment("MAT")
model <- add_pk_iiv(model)
model$statements$find_assignment("MAT")
## End(Not run)</pre>
```

add\_population\_parameter

 $add\_population\_parameter$ 

### Description

Add a new population parameter to the model

### Usage

```
add_population_parameter(
  model,
  name,
  init,
  lower = NULL,
  upper = NULL,
  fix = FALSE
)
```

# Arguments

model	(Model) Pharmpy model
name	(str) Name of the new parameter
init	(numeric) Initial estimate of the new parameter
lower	(numeric (optional)) Lower bound of the new parameter
upper	(numeric (optional)) Upper bound of the new parameter
fix	(logical) Should the new parameter be fixed?

add\_predictions 27

### Value

```
(Model) Pharmpy model object
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- add_population_parameter(model, 'POP_KA', 2)
model$parameters
## End(Not run)</pre>
```

add\_predictions

add\_predictions

### Description

Add predictions and/or residuals Add predictions to estimation step.

### Usage

```
add_predictions(model, pred)
```

#### **Arguments**

model (Model) Pharmpy model
pred (array(str)) List of predictions (e.g. c('IPRED', 'PRED'))

#### Value

```
(Model) Pharmpy model object
```

### See Also

```
remove_predictions
remove_residuals
set_estimation_step
add_estimation_step
remove_estimation_step
append_estimation_step_options
add_parameter_uncertainty_step
remove_parameter_uncertainty_step
```

28 add\_residuals

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$execution_steps[-1].predictions
model <- add_predictions(model, c('IPRED'))
model$execution_steps[-1].predictions
## End(Not run)</pre>
```

add\_residuals

add\_residuals

### **Description**

Add predictions and/or residuals

Add residuals to estimation step.

Added redidual variable(s) need to be one of the following : c('RES', 'IRES', 'WRES', 'IWRES', 'CWRES')

### Usage

```
add_residuals(model, res)
```

# Arguments

model (Model) Pharmpy model

res (array(str)) List of residuals (e.g. c('CWRES'))

#### Value

(Model) Pharmpy model object

#### See Also

```
remove_predictions
remove_residuals
set_estimation_step
add_estimation_step
remove_estimation_step
append_estimation_step_options
add_parameter_uncertainty_step
remove_parameter_uncertainty_step
```

add\_time\_after\_dose 29

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$execution_steps[-1].residuals
model <- add_residuals(model, c('WRES'))
model$execution_steps[-1].residuals
## End(Not run)</pre>
```

```
{\tt add\_time\_after\_dose} \qquad {\tt add\_time\_after\_dose}
```

# Description

Calculate and add a TAD column to the dataset

### Usage

```
add_time_after_dose(model)
```

### Arguments

model

(Model) Pharmpy model

### Value

(Model) Pharmpy model object

```
## Not run:
model <- load_example_model("pheno")
model <- add_time_after_dose(model)
## End(Not run)</pre>
```

Append estimation step options

Appends options to an existing estimation step.

### Usage

```
append_estimation_step_options(model, tool_options, idx)
```

### **Arguments**

```
model (Model) Pharmpy model
tool_options (list(str=any)) any additional tool specific options
idx (numeric) index of estimation step (starting from 0)
```

#### Value

```
(Model) Pharmpy model object
```

#### See Also

```
add_estimation_step
set_estimation_step
remove_estimation_step
add_parameter_uncertainty_step
remove_parameter_uncertainty_step
set_evaluation_step
```

```
## Not run:
model <- load_example_model("pheno")
opts <- list('NITER'=1000, 'ISAMPLE'=100)
model <- append_estimation_step_options(model, tool_options=opts, idx=0)
est <- model$execution_steps[1]
length(est$tool_options)
## End(Not run)</pre>
```

bin\_observations 31

bin\_observations bin\_observations

### **Description**

Bin all observations on the independent variable

Available binning methods:

#### Usage

```
bin_observations(model, method, nbins)
```

### Arguments

```
model (Model) Pharmpy model

method (str) Name of the binning method to use

nbins (numeric) The number of bins wanted
```

#### Value

(data.frame) A series of bin ids indexed on the original record index of the dataset vector A vector of bin edges

```
## Not run:
model <- load_example_model("pheno")
bins, boundaries <- bin_observations(model, method="equal_width", nbins=10)
bins
boundaries
## End(Not run)</pre>
```

32 calculate\_aic

bump\_model\_number

bump\_model\_number

### Description

If the model name ends in a number increase it

If path is set increase the number until no file exists with the same name in path. If model name does not end in a number do nothing.

#### Usage

```
bump_model_number(model, path = NULL)
```

# Arguments

model (Model) Pharmpy model object

path (str (optional)) Default is to not look for files.

#### Value

(Model) Pharmpy model object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- model$replace(name="run2")
model <- bump_model_number(model)
model$name
## End(Not run)</pre>
```

calculate\_aic

calculate\_aic

### Description

```
Calculate AIC
AIC = -2LL + 2*n_estimated_parameters
```

### Usage

```
calculate_aic(model, likelihood)
```

calculate\_bic 33

### **Arguments**

```
model (Model) Pharmpy model object likelihood (numeric) -2LL
```

#### Value

```
(numeric) AIC of model fit
```

calculate\_bic calculate\_bic

### Description

Calculate BIC

Different variations of the BIC can be calculated:

- | mixed (default) | BIC = -2LL + n\_random\_parameters \* log(n\_individuals) + | n\_fixed\_parameters \* log(n\_observations)
- | fixed | BIC = -2LL + n\_estimated\_parameters \* log(n\_observations)
- | random | BIC = -2LL + n\_estimated\_parameters \* log(n\_individuals)
- | iiv | BIC = -2LL + n\_estimated\_iiv\_omega\_parameters \* log(n\_individuals)

### Usage

```
calculate_bic(model, likelihood, type = "mixed")
```

### **Arguments**

model (Model) Pharmpy model object

likelihood (numeric) -2LL to use

type (str) Type of BIC to calculate. Default is the mixed effects.

### Value

```
(numeric) BIC of model fit
```

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
ofv <- results$ofv
calculate_bic(model, ofv)
calculate_bic(model, ofv, type='fixed')
calculate_bic(model, ofv, type='random')
calculate_bic(model, ofv, type='iiv')
## End(Not run)</pre>
```

Calculate correlation matrix from a covariance matrix

#### Usage

```
calculate_corr_from_cov(cov)
```

#### **Arguments**

cov (data.frame) Covariance matrix

#### Value

(data.frame) Correlation matrix

#### See Also

```
calculate_se_from_cov : Standard errors from covariance matrix
calculate_se_from_prec : Standard errors from precision matrix

calculate\_eta\_shrinkage

## **Description**

Calculate eta shrinkage for each eta

## Usage

```
calculate_eta_shrinkage(
  model,
  parameter_estimates,
  individual_estimates,
  sd = FALSE
)
```

### **Arguments**

#### Value

(Series) Shrinkage for each eta

#### See Also

calculate\_individual\_shrinkage

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
pe <- results$parameter_estimates
ie <- results$individual_estimates
calculate_eta_shrinkage(model, pe, ie)
calculate_eta_shrinkage(model, pe, ie, sd=TRUE)
## End(Not run)</pre>
```

#### **Description**

Calculate statistics for individual parameters

Calculate the mean (expected value of the distribution), variance (variance of the distribution) and standard error for individual parameters described by arbitrary expressions. Any dataset column or variable used in the model can be used in the expression. The exception being that variables that depends on the solution of the ODE system cannot be used. If covariates are used in the expression the statistics of the parameter is calculated at the median value of each covariate as well as at the 5:th and 95:th percentiles. If no parameter uncertainty is available for the model the standard error will not be calculated.

#### **Usage**

```
calculate_individual_parameter_statistics(
  model,
  expr_or_exprs,
  parameter_estimates,
  covariance_matrix = NULL,
  seed = NULL
)
```

### **Arguments**

```
model (Model) A previously estimated model

expr_or_exprs (array(BooleanExpr) or array(Expr) or array(str) or BooleanExpr or Expr or str)
    Parameter estimates

parameter_estimates
    (array) Parameter uncertainty covariance matrix

covariance_matrix
    (data.frame (optional)) expression or iterable of str or expressions Expressions or equations for parameters of interest. If equations are used the names of the left hand sides will be used as the names of the parameters.

seed (numeric (optional)) Random number generator or integer seed
```

#### Value

(data.frame) A DataFrame of statistics indexed on parameter and covariate value.

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
rng <- create_rng(23)
pe <- results$parameter_estimates
cov <- results$covariance_matrix
calculate_individual_parameter_statistics(model, "K=CL/V", pe, cov, seed=rng)
## End(Not run)</pre>
```

## Description

```
Calculate the individual eta-shrinkage
Definition: ieta_shr = (var(eta) / omega)
```

## Usage

```
calculate_individual_shrinkage(
  model,
  parameter_estimates,
  individual_estimates_covariance
)
```

### **Arguments**

#### Value

(DataFrame) Shrinkage for each eta and individual

#### See Also

```
calculate_eta_shrinkage
```

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
pe <- results$parameter_estimates
covs <- results$individual_estimates_covariance
calculate_individual_shrinkage(model, pe, covs)
## End(Not run)</pre>
```

# Description

Scale parameter values from ucp to normal scale

#### Usage

```
calculate_parameters_from_ucp(model, scale, ucps)
```

## Arguments

```
model (Model) Pharmpy model
scale (UCPScale) A parameter scale
ucps (array or list(str=numeric)) Series of parameter values
```

### Value

(data.frame) Parameters on the normal scale

#### See Also

calculate\_ucp\_scale : Calculate the scale for conversion from ucps

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
scale <- calculate_ucp_scale(model)
values <- list('POP_CL'=0.1, 'POP_VC'=0.1, 'COVAPGR'=0.1, 'IIV_CL'=0.1, 'IIV_VC'=0.1, 'SIGMA'=0.1)
calculate_parameters_from_ucp(model, scale, values)

## End(Not run)

calculate_pk_parameters_statistics</pre>
```

# Description

Calculate statistics for common pharmacokinetic parameters

Calculate the mean (expected value of the distribution), variance (variance of the distribution) and standard error for some individual pre-defined pharmacokinetic parameters.

calculate\_pk\_parameters\_statistics

## Usage

```
calculate_pk_parameters_statistics(
  model,
  parameter_estimates,
  covariance_matrix = NULL,
  seed = NULL
)
```

## **Arguments**

#### Value

(data.frame) A DataFrame of statistics indexed on parameter and covariate value.

#### See Also

calculate\_individual\_parameter\_statistics: Calculation of statistics for arbitrary parameters

#### **Examples**

### **Description**

Calculate precision matrix from a correlation matrix and standard errors

## Usage

```
calculate_prec_from_corrse(corr, se)
```

### **Arguments**

```
corr (data.frame) Correlation matrix
se (array) Standard errors
```

48 check\_dataset

```
calculate_ucp_scale calculate_ucp_scale
```

## **Description**

Calculate a scale for unconstrained parameters for a model

The UCPScale object can be used to calculate unconstrained parameters back into the normal parameter space.

## Usage

```
calculate_ucp_scale(model)
```

# Arguments

model

(Model) Model for which to calculate an ucp scale

#### Value

```
(UCPScale) A scale object
```

#### See Also

```
calculate_parameters_from_ucp: Calculate parameters from ucp:s
```

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
scale <- calculate_ucp_scale(model)
## End(Not run)</pre>
```

check\_dataset

check\_dataset

## **Description**

Check dataset for consistency across a set of rules

## Usage

```
check_dataset(model, dataframe = FALSE, verbose = FALSE)
```

## **Arguments**

model (Model) Pharmpy model object

dataframe (logical) TRUE to return a DataFrame instead of printing to the console verbose (logical) Print out all rules checked if TRUE else print only failed rules

#### Value

(data.frame) Only returns a DataFrame is dataframe=TRUE

```
check_high_correlations
```

check\_high\_correlations

# Description

Check for highly correlated parameter estimates

#### Usage

```
check_high_correlations(model, cor, limit = 0.9)
```

## **Arguments**

model (Model) Pharmpy model object

cor (data.frame) Estimated correlation matrix
limit (numeric) Lower limit for a high correlation

## Value

(data.frame) Correlation values indexed on pairs of parameters for (absolute) correlations above limit

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
cor <- results$correlation_matrix
check_high_correlations(model, cor, limit=0.3)
## End(Not run)</pre>
```

## **Description**

Check if any estimated parameter value is close to its bounds

# Usage

```
check_parameters_near_bounds(
  model,
  values,
  zero_limit = 0.001,
  significant_digits = 2
)
```

## **Arguments**

```
model (Model) Pharmpy model object

values (array) Series of values with index a subset of parameter names.

zero_limit (numeric) maximum distance to 0 bounds

significant_digits

(numeric) maximum distance to non-zero bounds in number of significant digits
```

#### Value

(data.frame) Logical Series with same index as values

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
check_parameters_near_bounds(model, results$parameter_estimates)
## End(Not run)</pre>
```

check\_pharmpy 51

check\_pharmpy

Checks version of Pharmpy/pharmr

## **Description**

Checks whether Pharmpy and pharmr has the same version

## Usage

```
check_pharmpy(pharmpy_version)
```

## **Arguments**

```
pharmpy_version
```

(str) version number as string

cleanup\_model

cleanup\_model

# Description

Perform various cleanups of a model

This is what is currently done

- Make model statements declarative, i.e. only one assignment per symbol
- Inline all assignments of one symbol, e.g. X = Y
- Remove all random variables with no variability (i.e. with omegas fixed to zero)
- Put fixed thetas directly in the model statements

# Usage

```
cleanup_model(model)
```

# **Arguments**

model

(Model) Pharmpy model object

#### Value

(Model) Updated model

### Note

When creating NONMEM code from the cleaned model Pharmpy might need toadd certain assignments to make it in line with what NONMEM requires.

52 convert\_model

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$statements
model <- cleanup_model(model)
model$statements
## End(Not run)</pre>
```

convert\_model

convert\_model

## **Description**

Convert model to other format

Note that the operation is not done inplace.

## Usage

```
convert_model(model, to_format)
```

# **Arguments**

model (Model) Model to convert

to\_format (str) Name of format to convert into. Currently supported 'generic', 'nlmixr',

'nonmem', and 'rxode'

## Value

(Model) New model object with new underlying model format

```
## Not run:
model <- load_example_model("pheno")
converted_model <- convert_model(model, "nlmixr")
## End(Not run)</pre>
```

```
create_basic_pk_model create_basic_pk_model
```

## **Description**

Creates a basic pk model of given type. The model will be a one compartment model, with first order elimination and in the case of oral administration first order absorption with no absorption delay. The elimination rate will be (equation could not be rendered, see API doc on website)

#### Usage

```
create_basic_pk_model(
  administration = "iv",
  dataset_path = NULL,
  cl_init = 0.01,
  vc_init = 1,
  mat_init = 0.1
)
```

#### **Arguments**

```
administration (str) Type of PK model to create. Supported are 'iv', 'oral' and 'ivoral'
dataset_path (str (optional)) Optional path to a dataset
cl_init (numeric) Initial estimate of the clearance parameter
vc_init (numeric) Initial estimate of the central volume parameter
mat_init (numeric) Initial estimate of the mean absorption time parameter (if applicable)
```

#### Value

```
(Model) Pharmpy model object
```

```
## Not run:
model <- create_basic_pk_model('oral')
## End(Not run)</pre>
```

54 create\_context

```
create\_config\_template \\ create\_config\_template
```

# Description

Create a basic config file template

If a configuration file already exists it will not be overwritten

## Usage

```
create_config_template()
```

## **Examples**

```
## Not run:
create_config_template()
## End(Not run)
```

create\_context

create\_context

# Description

Create a new context

Currently a local filesystem context (i.e. a directory)

## Usage

```
create_context(name, path = NULL)
```

## **Arguments**

name (str) Name of the context

path (str (optional)) Path to where to put the context

```
## Not run:
ctx <- create_context("myproject")
## End(Not run)</pre>
```

### **Description**

Combines some or all etas into a joint distribution.

The etas must be IIVs and cannot be fixed. Initial estimates for covariance between the etas is dependent on whether the model has results from a previous run. In that case, the correlation will be calculated from individual estimates, otherwise correlation will be set to 10%.

#### Usage

```
create_joint_distribution(model, rvs = NULL, individual_estimates = NULL)
```

## **Arguments**

model (Model) Pharmpy model

rvs (array(str) (optional)) Sequence of etas or names of etas to combine. If NULL,

all etas that are IIVs and non-fixed will be used (full block). NULL is default.

individual\_estimates

(data.frame (optional)) Optional individual estimates to use for calculation of

initial estimates

### Value

```
(Model) Pharmpy model object
```

#### See Also

```
split_joint_distribution: split etas into separate distributions
```

```
## Not run:
model <- load_example_model("pheno")
model$random_variables$etas
model <- create_joint_distribution(model, c('ETA_CL', 'ETA_VC'))
model$random_variables$etas
## End(Not run)</pre>
```

56 create\_rng

create\_report

create\_report

## **Description**

Create standard report for results

The report will be an html created at specified path.

## Usage

```
create_report(results, path)
```

## **Arguments**

results

(Results) Results for which to create report

path

(str) Path to report file

create\_rng

create\_rng

## **Description**

Create a new random number generator

Pharmpy functions that use random sampling take a random number generator or seed as input. This function can be used to create a default new random number generator.

## Usage

```
create_rng(seed = NULL)
```

## Arguments

seed

(numeric (optional)) Seed for the random number generator or NULL (default) for a randomized seed. If seed is generator it will be passed through.

## Value

(Generator) Initialized numpy random number generator object

```
## Not run:
rng <- create_rng(23)
rng$standard_normal()
## End(Not run)</pre>
```

create\_symbol 57

create\_symbol

create\_symbol

#### **Description**

Create a new unique variable symbol given a model

#### Usage

```
create_symbol(model, stem, force_numbering = FALSE)
```

#### **Arguments**

model (Model) Pharmpy model object stem (str) First part of the new variable name force\_numbering

(logical) Forces addition of number to name even if variable does not exist, e.g.  $COVEFF \rightarrow COVEFF1$ 

#### Value

(Symbol) Created symbol with unique name

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
create_symbol(model, "TEMP")
create_symbol(model, "TEMP", force_numbering=TRUE)
create_symbol(model, "CL")
## End(Not run)</pre>
```

deidentify\_data

deidentify\_data

## Description

Deidentify a dataset

Two operations are performed on the dataset:

- 1. All ID numbers are randomized from the range 1 to n
- 2. All columns containing dates will have the year changed

The year change is done by letting the earliest year in the dataset be used as a reference and by maintaining leap years. The reference year will either be 1901, 1902, 1903 or 1904 depending on its distance to the closest preceding leap year.

58 display\_odes

## Usage

```
deidentify_data(df, id_column = "ID", date_columns = NULL)
```

## **Arguments**

df (data.frame) A dataset

id\_column (str) Name of the id column

date\_columns (array(str) (optional)) Names of all date columns

#### Value

(data.frame) Deidentified dataset

display\_odes

display\_odes

## **Description**

Displays the ordinary differential equation system

## Usage

```
display_odes(model)
```

# Arguments

model

(Model) Pharmpy model

## Value

```
(ODEDisplayer) A displayable object
```

```
## Not run:
model <- load_example_model("pheno")
display_odes(model)
## End(Not run)</pre>
```

drop\_columns 59

drop_columns	drop columns

# Description

Drop columns from the dataset or mark as dropped

## Usage

```
drop_columns(model, column_names, mark = FALSE)
```

# Arguments

model (Model) Pharmpy model object

column\_names (array(str) or str) List of column names or one column name to drop or mark as

dropped

mark (logical) Default is to remove column from dataset. Set this to TRUE to only

mark as dropped

#### Value

```
(Model) Pharmpy model object
```

### See Also

```
drop_dropped_columns : Drop all columns marked as drop undrop_columns : Undrop columns of model
```

```
## Not run:
model <- load_example_model("pheno")
model <- drop_columns(model, c('WGT', 'APGR'))
vector(model$dataset$columns)
## End(Not run)</pre>
```

```
drop_dropped_columns
```

#### **Description**

Drop columns marked as dropped from the dataset

NM-TRAN date columns will not be dropped by this function even if marked as dropped. Columns not specified in the datainfo (\$INPUT for NONMEM) will also be dropped from the dataset.

#### Usage

```
drop_dropped_columns(model)
```

## **Arguments**

model

(Model) Pharmpy model object

#### Value

(Model) Pharmpy model object

#### See Also

drop\_columns: Drop specific columns or mark them as drop

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- drop_dropped_columns(model)
vector(model$dataset$columns)
## End(Not run)</pre>
```

```
evaluate_epsilon_gradient
```

evaluate\_epsilon\_gradient

## **Description**

Evaluate the numeric epsilon gradient

The gradient is evaluated at the current model parameter values or optionally at the given parameter values. The gradient is done for each data record in the model dataset or optionally using the dataset argument. The gradient is done at the current eta values or optionally at the given eta values.

This function currently only support models without ODE systems

evaluate\_eta\_gradient 61

#### Usage

```
evaluate_epsilon_gradient(
  model,
  etas = NULL,
  parameters = NULL,
  dataset = NULL
)
```

### **Arguments**

model (Model) Pharmpy model

etas (data.frame (optional)) Optional list of eta values

parameters (list(str=numeric) (optional)) Optional list of parameters and values

dataset (data.frame (optional)) Optional dataset

#### Value

```
(data.frame) Gradient
```

#### See Also

```
evaluate_eta_gradient : Evaluate the eta gradient
```

## **Examples**

```
## Not run:
model <- load_example_model("pheno_linear")
results <- load_example_modelfit_results("pheno_linear")
etas <- results$individual_estimates
evaluate_epsilon_gradient(model, etas=etas)
## End(Not run)</pre>
```

```
evaluate_eta_gradient evaluate_eta_gradient
```

### Description

Evaluate the numeric eta gradient

The gradient is evaluated at the current model parameter values or optionally at the given parameter values. The gradient is done for each data record in the model dataset or optionally using the dataset argument. The gradient is done at the current eta values or optionally at the given eta values.

This function currently only support models without ODE systems

### Usage

```
evaluate_eta_gradient(model, etas = NULL, parameters = NULL, dataset = NULL)
```

62 evaluate\_expression

# **Arguments**

model (Model) Pharmpy model

etas (data.frame (optional)) Optional list of eta values

parameters (list(str=numeric) (optional)) Optional list of parameters and values

dataset (data.frame (optional)) Optional dataset

#### Value

```
(data.frame) Gradient
```

## See Also

```
evaluate_epsilon_gradient : Evaluate the epsilon gradient
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno_linear")
results <- load_example_modelfit_results("pheno_linear")
etas <- results$individual_estimates
evaluate_eta_gradient(model, etas=etas)
## End(Not run)</pre>
```

evaluate\_expression evaluate\_expression

mates

#### **Description**

Evaluate expression using model

Calculate the value of expression for each data record. The expression can contain dataset columns, variables in model and population parameters. If the model has parameter estimates these will be used. Initial estimates will be used for non-estimated parameters.

### Usage

```
evaluate_expression(model, expression, parameter_estimates = NULL)
```

### **Arguments**

```
model (Model) Pharmpy model

expression (str or numeric or Expr) Expression to evaluate

parameter_estimates

(list(str=numeric) (optional)) Parameter estimates to use instead of initial esti-
```

#### Value

(data.frame) A series of one evaluated value for each data record

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
pe <- results$parameter_estimates
evaluate_expression(model, "TVCL*1000", parameter_estimates=pe)
## End(Not run)</pre>
```

## Description

Evaluate the numeric individual prediction

The prediction is evaluated at the current model parameter values or optionally at the given parameter values. The evaluation is done for each data record in the model dataset or optionally using the dataset argument. The evaluation is done at the current eta values or optionally at the given eta values.

This function currently only support models without ODE systems

### Usage

```
evaluate_individual_prediction(
  model,
  etas = NULL,
  parameters = NULL,
  dataset = NULL
)
```

### **Arguments**

```
model (Model) Pharmpy model
etas (data.frame (optional)) Optional list of eta values
parameters (list(str=numeric) (optional)) Optional list of parameters and values
dataset (data.frame (optional)) Optional dataset
```

### Value

```
(data.frame) Individual predictions
```

#### See Also

evaluate\_population\_prediction: Evaluate the population prediction

#### **Examples**

```
## Not run:
model <- load_example_model("pheno_linear")
results <- load_example_modelfit_results("pheno_linear")
etas <- results$individual_estimates
evaluate_individual_prediction(model, etas=etas)
## End(Not run)</pre>
```

```
evaluate_population_prediction
```

evaluate\_population\_prediction

## **Description**

Evaluate the numeric population prediction

The prediction is evaluated at the current model parameter values or optionally at the given parameter values. The evaluation is done for each data record in the model dataset or optionally using the dataset argument.

This function currently only support models without ODE systems

#### Usage

```
evaluate_population_prediction(model, parameters = NULL, dataset = NULL)
```

## **Arguments**

model (Model) Pharmpy model

parameters (list(str=numeric) (optional)) Optional list of parameters and values

dataset (data.frame (optional)) Optional dataset

### Value

```
(data.frame) Population predictions
```

#### See Also

evaluate\_individual\_prediction: Evaluate the individual prediction

### **Examples**

## **Description**

Evaluate the weighted residuals

The residuals is evaluated at the current model parameter values or optionally at the given parameter values. The residuals is done for each data record in the model dataset or optionally using the dataset argument.

This function currently only support models without ODE systems

#### Usage

```
evaluate_weighted_residuals(model, parameters = NULL, dataset = NULL)
```

### **Arguments**

```
model (Model) Pharmpy model

parameters (list(str=numeric) (optional)) Optional list of parameters and values

dataset (data.frame (optional)) Optional dataset
```

## Value

```
(data.frame) WRES
```

```
## Not run:
model <- load_example_model("pheno_linear")
results <- load_example_modelfit_results("pheno_linear")
parameters <- results$parameter_estimates
evaluate_weighted_residuals(model, parameters=list(parameters))
## End(Not run)</pre>
```

filter\_dataset

```
expand_additional_doses
```

expand\_additional\_doses

## **Description**

Expand additional doses into separate dose records

#### Usage

```
expand_additional_doses(model, flag = FALSE)
```

## **Arguments**

model (Model) Pharmpy model object

flag (logical) TRUE to add a boolean EXPANDED column to mark added records.

In this case all columns in the original dataset will be kept. Care needs to be

taken to handle the new dataset.

## Value

(Model) Pharmpy model object

filter\_dataset

filter\_dataset

# Description

Filter dataset according to expr and return a model with the filtered dataset.

Example: "DVID == 1" will filter the dataset so that only the rows with DVID = 1 remain.

## Usage

```
filter_dataset(model, expr)
```

# Arguments

model (Model) Pharmpy model object expr (str) expression for dataset query

### Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$dataset
model <- filter_dataset(model, 'WGT < 1.4')
model$dataset
## End(Not run)</pre>
```

 ${\tt find\_clearance\_parameters}$ 

find\_clearance\_parameters

# Description

Find clearance parameters in model

# Usage

```
find_clearance_parameters(model)
```

# Arguments

model (Model) Pharmpy model

# Value

(vector) A vector of clearance parameters

```
## Not run:
model <- load_example_model("pheno")
find_clearance_parameters(model)
## End(Not run)</pre>
```

68 fit

```
find_volume_parameters
```

find\_volume\_parameters

# Description

Find volume parameters in model

# Usage

```
find_volume_parameters(model)
```

## **Arguments**

model

(Model) Pharmpy model

## Value

(vector) A vector of volume parameters

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
find_volume_parameters(model)
## End(Not run)</pre>
```

fit

fit

## **Description**

Fit models.

## Usage

```
fit(model_or_models, esttool = NULL, path = NULL, context = NULL)
```

## **Arguments**

```
model_or_models
```

(Model or array(Model)) List of models or one single model

esttool (str (optional)) Estimation tool to use. NULL to use default

path (str (optional)) Path to fit directory

context (Context (optional)) Run in this context

## Value

(ModelfitResults | vector of ModelfitResults) ModelfitResults for the model or models

#### See Also

run tool

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- fit(model)
## End(Not run)</pre>
```

fix\_or\_unfix\_parameters

fix\_or\_unfix\_parameters

## **Description**

Fix or unfix parameters

Set fixedness of parameters to specified values

## Usage

```
fix_or_unfix_parameters(model, parameters, strict = TRUE)
```

## **Arguments**

model (Model) Pharmpy model

parameters (list(str=logical)) Set fix/unfix for these parameters

strict (logical) Whether all parameters in input need to exist in the model. Default is

**TRUE** 

#### Value

(Model) Pharmpy model object

#### See Also

fix\_parameters : Fix parameters

unfix\_paramaters : Unfixing parameters

fix\_paramaters\_to: Fixing parameters and setting a new initial estimate in the same

function

unfix\_paramaters\_to: Unfixing parameters and setting a new initial estimate in the same

function

70 fix\_parameters

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$parameters['POP_CL']
model <- fix_or_unfix_parameters(model, list('POP_CL'=TRUE))
model$parameters['POP_CL']

## End(Not run)</pre>
```

fix\_parameters

fix\_parameters

# Description

Fix parameters

Fix all listed parameters

### Usage

```
fix_parameters(model, parameter_names, strict = TRUE)
```

#### **Arguments**

```
model (Model) Pharmpy model

parameter_names

(array(str) or str) one parameter name or a vector of parameter names

strict (logical) Whether all parameters in input need to exist in the model. Default is TRUE
```

#### Value

(Model) Pharmpy model object

#### See Also

```
fix_or_unfix_parameters: Fix or unfix parameters (given boolean)
fix_parameters_to: Fixing and setting parameter initial estimates in the same function
unfix_paramaters: Unfixing parameters
unfix_paramaters_to: Unfixing parameters and setting a new initial estimate in the same
function
```

fix\_parameters\_to 71

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$parameters['POP_CL']
model <- fix_parameters(model, 'POP_CL')
model$parameters['POP_CL']
## End(Not run)</pre>
```

fix\_parameters\_to

fix\_parameters\_to

# Description

Fix parameters to

Fix all listed parameters to specified value/values

## Usage

```
fix_parameters_to(model, inits, strict = TRUE)
```

## **Arguments**

model	(Model) Pharmpy model
inits	(list(str=numeric)) Inits for all parameters to fix and set init
strict	(logical) Whether all parameters in input need to exist in the model. Default is TRUE

### Value

```
(Model) Pharmpy model object
```

## See Also

```
fix_parameters: Fix parameters
fix_or_unfix_parameters: Fix or unfix parameters (given boolean)
unfix_paramaters: Unfixing parameters
unfix_paramaters_to: Unfixing parameters and setting a new initial estimate in the same function
```

72 get\_baselines

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$parameters['POP_CL']
model <- fix_parameters_to(model, list('POP_CL'=0.5))
model$parameters['POP_CL']
## End(Not run)</pre>
```

get\_admid

get\_admid

# Description

Get the admid from model dataset

If an administration column is present this will be extracted otherwise an admid column will be created based on the admids of the present doses. This is dependent on the presence of a CMT column to be generated correctly.

When generated, admids of events in between doses is set to the last used admid.

#### Usage

```
get_admid(model)
```

## **Arguments**

model

(Model) Pharmpy model

#### Value

(data.frame) ADMID

get\_baselines

get\_baselines

## **Description**

Baselines for each subject.

Baseline is taken to be the first row even if that has a missing value.

# Usage

```
get_baselines(model)
```

get\_bioavailability 73

# Arguments

```
model (Model) Pharmpy model
```

### Value

```
(data.frame) Dataset with the baselines
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_baselines(model)
## End(Not run)</pre>
```

```
get_bioavailability get_bioavailability
```

# Description

Get bioavailability of doses for all compartments

# Usage

```
get_bioavailability(model)
```

# Arguments

```
model (Model) Pharmpy model
```

### Value

(list) Dictionary from compartment name to bioavailability expression

74 get\_cmt

```
\label{lem:get_central_volume_and_clearance} get\_central\_volume\_and\_clearance
```

#### **Description**

Get the volume and clearance parameters

# Usage

```
get_central_volume_and_clearance(model)
```

### **Arguments**

model

(Model) Pharmpy model

#### Value

(sympy.Symbol) Volume symbol sympy.Symbol Clearance symbol

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_central_volume_and_clearance(model)
## End(Not run)</pre>
```

get\_cmt

get\_cmt

# Description

Get the cmt (compartment) column from the model dataset

If a cmt column is present this will be extracted otherwise a cmt column will be created. If created, multiple dose compartments are dependent on the presence of an admid type column, otherwise, dose/non-dose will be considered.

### Usage

```
get_cmt(model)
```

#### **Arguments**

model

(Model) Pharmpy model

### Value

```
(data.frame) CMT
```

```
{\tt get\_concentration\_parameters\_from\_data} \\ {\tt get\_concentration\_parameters\_from\_data}
```

# Description

Create a dataframe with concentration parameters

Note that all values are directly calculated from the dataset

#### Usage

```
get_concentration_parameters_from_data(model)
```

### **Arguments**

model

(Model) Pharmpy model object

#### Value

(data.frame) Concentration parameters

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_concentration_parameters_from_data(model)
## End(Not run)</pre>
```

get\_config\_path

get\_config\_path

# Description

Returns path to the user config path

# Usage

```
get_config_path()
```

### Value

(str or NULL) Path to user config or NULL if file does not exist

# Examples

```
## Not run:
get_config_path()
## End(Not run)
```

```
get_covariate_baselines
```

get\_covariate\_baselines

# Description

Return a dataframe with baselines of all covariates for each id.

Baseline is taken to be the first row even if that has a missing value.

### Usage

```
get_covariate_baselines(model)
```

### **Arguments**

model

(Model) Pharmpy model

### Value

(data.frame) covariate baselines

### See Also

```
get_baselines: baselines for all data columns
```

```
## Not run:
model <- load_example_model("pheno")
model <- set_covariates(model, c("WGT", "APGR"))
get_covariate_baselines(model)
## End(Not run)</pre>
```

get\_covariate\_effects 77

```
get_covariate_effects get_covariate_effects
```

### **Description**

Return a list of all used covariates within a model

The list will have parameter name as key with a connected value as a vector of tuple(s) with (covariate, effect type, operator)

### Usage

```
get_covariate_effects(model)
```

### **Arguments**

model

(Model) Model to extract covariates from.

#### Value

(Dictionary : Dictionary of parameters and connected covariate(s))

get\_doseid

get\_doseid

### **Description**

Get a DOSEID series from the dataset with an id of each dose period starting from 1

If a a dose and observation exist at the same time point the observation will be counted towards the previous dose.

#### Usage

```
get_doseid(model)
```

# Arguments

model

(Model) Pharmpy model

#### Value

```
(data.frame) DOSEIDs
```

78 get\_doses

# Examples

```
## Not run:
model <- load_example_model("pheno")
get_doseid(model)
## End(Not run)</pre>
```

get\_doses

get\_doses

# Description

Get a series of all doses

Indexed with ID and TIME

# Usage

```
get_doses(model)
```

# Arguments

model

(Model) Pharmpy model

# Value

(data.frame) doses

```
## Not run:
model <- load_example_model("pheno")
get_doses(model)
## End(Not run)</pre>
```

get\_dv\_symbol 79

get\_dv\_symbol

get\_dv\_symbol

# Description

Get the symbol for a certain dvid or dv and check that it is valid

### Usage

```
get_dv_symbol(model, dv = NULL)
```

### **Arguments**

model (Model) Pharmpy model

dv (Expr or str or numeric (optional)) Either a dv symbol, str or dvid. If NULL

(default) return the only or first dv.

#### Value

```
(sympy.Symbol) DV symbol
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_dv_symbol(model, "Y")
get_dv_symbol(model, 1)
## End(Not run)</pre>
```

get\_evid

get\_evid

# Description

Get the evid from model dataset

If an event column is present this will be extracted otherwise an evid column will be created.

### Usage

```
get_evid(model)
```

### **Arguments**

model

(Model) Pharmpy model

#### Value

```
(data.frame) EVID
```

get\_ids

get\_ids

### **Description**

Retrieve a vector of all subject ids of the dataset

#### Usage

```
get_ids(model)
```

#### **Arguments**

model

(Model) Pharmpy model

#### Value

(vector) All subject ids

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_ids(model)
## End(Not run)</pre>
```

```
{\tt get\_individual\_parameters}
```

get\_individual\_parameters

# Description

Retrieves all individual parameters in a :class:pharmpy.model.

By default all individual parameters will be found even ones having no random effect. The level arguments makes it possible to find only those having any random effect or only those having a certain random effect. Using the dv option will give all individual parameters affecting a certain dv. Note that the DV for PD in a PKPD model often also is affected by the PK parameters.

#### Usage

```
get_individual_parameters(model, level = "all", dv = NULL)
```

#### **Arguments**

model	(Model) Pharmpy model to retrieve the individuals parameters from
level	(str) The variability level to look for: 'iiv', 'iov', 'random' or 'all' (default)
dv	(str or Expr or numeric (optional)) Name or DVID of dependent variable. NULL
	for all (default)

#### Value

(vectorc(str)) A vector of the parameter names as strings

#### See Also

```
get_pd_parameters
get_pk_parameters
get_rv_parameters
has_random_effect
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_individual_parameters(model)
get_individual_parameters(model, 'iiv')
get_individual_parameters(model, 'iov')
## End(Not run)</pre>
```

# Description

Get the full symbolic expression for the modelled individual prediction This function currently only support models without ODE systems

### Usage

```
get_individual_prediction_expression(model)
```

# **Arguments**

model (Model) Pharmpy model object

#### Value

(Expression) Symbolic expression

82 get\_initial\_conditions

#### See Also

get\_population\_prediction\_expression : Get full symbolic epression for the population prediction

### **Examples**

```
## Not run:
model <- load_example_model("pheno_linear")
get_individual_prediction_expression(model)
## End(Not run)</pre>
```

```
{\it get\_initial\_conditions} \\ {\it get\_initial\_conditions}
```

# Description

Get initial conditions for the ode system

Default initial conditions at t=0 for amounts is 0

### Usage

```
get_initial_conditions(model, dosing = FALSE)
```

### **Arguments**

model (Model) Pharmpy model

dosing (logical) Set to TRUE to add dosing as initial conditions

#### Value

(list) Initial conditions

```
## Not run:
model <- load_example_model("pheno")
get_initial_conditions(model)
get_initial_conditions(model, dosing=TRUE)
## End(Not run)</pre>
```

get\_lag\_times 83

get\_lag\_times

get\_lag\_times

# Description

Get lag times for all compartments

# Usage

```
get_lag_times(model)
```

# **Arguments**

model

(Model) Pharmpy model

# Value

(list) Dictionary from compartment name to lag time expression

 ${\tt get\_mdv}$ 

get\_mdv

# Description

Get MDVs from dataset

# Usage

```
get_mdv(model)
```

# Arguments

model

(Model) Pharmpy model

#### Value

(data.frame) MDVs

84 get\_model\_covariates

get\_model\_code

get\_model\_code

# Description

Get the model code of the underlying model language as a string

### Usage

```
get_model_code(model)
```

### **Arguments**

model

(Model) Pharmpy model

#### Value

(str) Model code

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
code <- get_model_code(model)
## End(Not run)</pre>
```

```
get_model_covariates
```

### Description

List of covariates used in model

A covariate in the model is here defined to be a data item affecting the model prediction excluding dosing items that are not used in model code.

### Usage

```
get_model_covariates(model, strings = FALSE)
```

### Arguments

```
model (Model) Pharmpy model
```

strings (logical) Return strings instead of symbols? FALSE (default) will give symbols

# Value

```
(vector) Covariate symbols or names
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_model_covariates(model)
get_model_covariates(model, strings=TRUE)
## End(Not run)</pre>
```

# Description

Return Mu name connected to parameter

If the given parameter is not dependent on any Mu, NULL is returned

### Usage

```
get_mu_connected_to_parameter(model, parameter)
```

### **Arguments**

model (Model) Pharmpy model object.

parameter (str) Name of parameter which to find Mu parameter for.

### Value

(str) Name of Mu parameter or NULL

Retrieve the number of individuals in the model dataset

#### Usage

```
get_number_of_individuals(model)
```

### Arguments

model

(Model) Pharmpy model

#### Value

(integer) Number of individuals in the model dataset

#### Note

For NONMEM models this is the number of individuals of the active dataset, i.e. after filtering of IGNORE and ACCEPT and removal of individuals with no observations.

### See Also

```
get_number_of_observations : Get the number of observations in a dataset
get_number_of_observations_per_individual : Get the number of observations per individual in a
dataset
```

```
## Not run:
model <- load_example_model("pheno")
get_number_of_individuals(model)
## End(Not run)</pre>
```

```
{\it get\_number\_of\_observations} \\ {\it get\_number\_of\_observations}
```

Retrieve the total number of observations in the model dataset

#### Usage

```
get_number_of_observations(model)
```

### Arguments

model

(Model) Pharmpy model

#### Value

(integer) Number of observations in the model dataset

#### Note

For NONMEM models this is the number of observations of the active dataset, i.e. after filtering of IGNORE and ACCEPT and removal of individuals with no observations.

### See Also

```
get_number_of_individuals : Get the number of individuals in a dataset get_number_of_observations_per_individual : Get the number of observations per individual in a dataset
```

```
## Not run:
model <- load_example_model("pheno")
get_number_of_observations(model)
## End(Not run)</pre>
```

```
{\tt get\_number\_of\_observations\_per\_individual} \\ {\tt get\_number\_of\_observations\_per\_individual}
```

Number of observations for each individual

#### Usage

```
get_number_of_observations_per_individual(model)
```

### Arguments

model

(Model) Pharmpy model

#### Value

(data.frame) Number of observations in the model dataset

#### Note

For NONMEM models this is the individuals and number of observations of the active dataset, i.e. after filtering of IGNORE and ACCEPT and removal of individuals with no observations.

# See Also

```
get_number_of_individuals : Get the number of individuals in a dataset get_number_of_observations_per_individual : Get the number of observations per individual in a dataset
```

```
## Not run:
model <- load_example_model("pheno")
get_number_of_observations_per_individual(model)
## End(Not run)</pre>
```

Return the number of peripherals compartments connected to the central compartment

### Usage

```
get_number_of_peripheral_compartments(model)
```

# Arguments

mode1

(Model) Pharmpy model

#### Value

(integer) Number of peripherals compartments

```
{\tt get\_number\_of\_transit\_compartments} \\ {\tt get\_number\_of\_transit\_compartments}
```

# Description

Return the number of transit compartments in the model

### Usage

```
{\tt get\_number\_of\_transit\_compartments(model)}
```

### **Arguments**

model

(Model) Pharmpy model

#### Value

(integer) Number of transit compartments

get\_observations

get\_observations

# Description

Get observations from dataset

### Usage

```
get_observations(model, keep_index = FALSE)
```

### **Arguments**

model (Model) Pharmpy model

keep\_index (logical) Set to TRUE if the original index should be kept. Otherwise a new

index using ID and idv will be created.

#### Value

(data.frame) Observations indexed over ID and TIME

#### See Also

```
get_number_of_observations : get the number of observations get_number_of_observations_per_individual : get the number of observations per individual
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_observations(model)
## End(Not run)</pre>
```

### **Description**

Get the full symbolic expression for the observation according to the model This function currently only support models without ODE systems

#### Usage

```
get_observation_expression(model)
```

get\_omegas 91

### **Arguments**

model

(Model) Pharmpy model object

#### Value

```
(Expression) Symbolic expression
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno_linear")
expr <- get_observation_expression(model)
print(expr$unicode())
## End(Not run)</pre>
```

 ${\tt get\_omegas}$ 

get\_omegas

### **Description**

Get all omegas (variability parameters) of a model

#### Usage

```
get_omegas(model)
```

### **Arguments**

model

(Model) Pharmpy model object

#### Value

(Parameters) A copy of all omega parameters

### See Also

```
get_thetas : Get theta parameters
get_sigmas : Get sigma parameters
```

```
## Not run:
model <- load_example_model("pheno")
get_omegas(model)
## End(Not run)</pre>
```

92 get\_parameter\_rv

# Description

Retrieves name of random variable in :class:pharmpy.model.Model given a parameter.

### Usage

```
get_parameter_rv(model, parameter, var_type = "iiv")
```

# Arguments

model (Model) Pharmpy model to retrieve parameters from

parameter (str) Name of parameter to retrieve random variable from

var\_type (str) Variability type: iiv (default) or iov

### Value

(vectorc(str)) A vector of random variable names for the given parameter

#### See Also

```
get_rv_parameters
has_random_effect
get_pk_parameters
get_individual_parameters
```

```
## Not run:
model <- load_example_model("pheno")
get_parameter_rv(model, 'CL')
## End(Not run)</pre>
```

get\_pd\_parameters 93

get\_pd\_parameters

get\_pd\_parameters

### **Description**

Retrieves PD parameters in :class:pharmpy.model.Model.

#### Usage

```
get_pd_parameters(model)
```

### **Arguments**

model

(Model) Pharmpy model to retrieve the PD parameters from

#### Value

(vectorc(str)) A vector of the PD parameter names of the given model

#### See Also

```
get_pk_parameters
```

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_direct_effect(model, "linear")
get_pd_parameters(model)
## End(Not run)</pre>
```

get\_pk\_parameters

get\_pk\_parameters

#### **Description**

Retrieves PK parameters in :class:pharmpy.model.Model.

#### Usage

```
get_pk_parameters(model, kind = "all")
```

### **Arguments**

model (Model) Pharmpy model to retrieve the PK parameters from

kind (str) The type of parameter to retrieve: 'absorption', 'distribution', 'elimination',

or 'all' (default).

#### Value

(vectorc(str)) A vector of the PK parameter names of the given model

#### See Also

```
get_individual_parameters
get_rv_parameters
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_pk_parameters(model)
get_pk_parameters(model, 'absorption')
get_pk_parameters(model, 'distribution')
get_pk_parameters(model, 'elimination')
## End(Not run)</pre>
```

### **Description**

Get the full symbolic expression for the modelled population prediction This function currently only support models without ODE systems

# Usage

```
get_population_prediction_expression(model)
```

### **Arguments**

```
model (Model) Pharmpy model object
```

#### Value

```
(Expression) Symbolic expression
```

#### See Also

```
get_individual_prediction_expression: Get full symbolic epression for the individual prediction
```

get\_rv\_parameters 95

### **Examples**

```
## Not run:
model <- load_example_model("pheno_linear")
get_population_prediction_expression(model)
## End(Not run)</pre>
```

get\_rv\_parameters

get\_rv\_parameters

### **Description**

Retrieves parameters in :class:pharmpy.model.Model given a random variable.

### Usage

```
get_rv_parameters(model, rv)
```

### Arguments

model (Model) Pharmpy model to retrieve parameters from

rv (str) Name of random variable to retrieve

#### Value

(vectorc(str)) A vector of parameter names for the given random variable

# See Also

```
has_random_effect
get_pk_parameters
get_individual_parameters
```

```
## Not run:
model <- load_example_model("pheno")
get_rv_parameters(model, 'ETA_CL')
## End(Not run)</pre>
```

96 get\_thetas

 ${\tt get\_sigmas}$ 

get\_sigmas

# Description

Get all sigmas (residual error variability parameters) of a model

### Usage

```
get_sigmas(model)
```

# Arguments

model

(Model) Pharmpy model object

#### Value

(Parameters) A copy of all sigma parameters

#### See Also

```
get_thetas : Get theta parameters
get_omegas : Get omega parameters
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_sigmas(model)
## End(Not run)</pre>
```

get\_thetas

get\_thetas

# Description

Get all thetas (structural parameters) of a model

### Usage

```
get_thetas(model)
```

# Arguments

model

(Model) Pharmpy model object

get\_unit\_of 97

### Value

(Parameters) A copy of all theta parameters

#### See Also

```
get_omegas : Get omega parameters
get_sigmas : Get sigma parameters
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_thetas(model)
## End(Not run)</pre>
```

get\_unit\_of

get\_unit\_of

### **Description**

Derive the physical unit of a variable in the model

Unit information for the dataset needs to be available. The variable can be defined in the code, a dataset olumn, a parameter or a random variable.

### Usage

```
get_unit_of(model, variable)
```

#### **Arguments**

model (Model) Pharmpy model object variable (str) Find physical unit of this variable

#### Value

(Unit) A unit expression

```
## Not run:
model <- load_example_model("pheno")
get_unit_of(model, "Y")
get_unit_of(model, "VC")
get_unit_of(model, "WGT")
## End(Not run)</pre>
```

98 greekify\_model

```
get_zero_order_inputs
```

### Description

Get zero order inputs for all compartments

### Usage

```
get_zero_order_inputs(model)
```

### **Arguments**

model

(Model) Pharmpy model

### Value

```
(sympy.Matrix) Vector of inputs
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
get_zero_order_inputs(model)
## End(Not run)</pre>
```

 ${\sf greekify\_model}$ 

 $greekify\_model$ 

# Description

Convert to using greek letters for all population parameters

### Usage

```
greekify_model(model, named_subscripts = FALSE)
```

### **Arguments**

```
model
named_subscripts
```

(logical) Use previous parameter names as subscripts. Default is to use integer subscripts

### Value

(Model) Pharmpy model object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$statements
model <- greekify_model(cleanup_model(model))
model$statements
## End(Not run)</pre>
```

```
has_additive_error_model
```

has\_additive\_error\_model

### **Description**

Check if a model has an additive error model

Multiple dependent variables are supported. By default the only (in case of one) or the first (in case of many) dependent variable is going to be checked.

### Usage

```
has_additive_error_model(model, dv = NULL)
```

### **Arguments**

model (Model) The model to check

dv (str or Expr or numeric (optional)) Name or DVID of dependent variable. NULL

for the default (first or only)

#### Value

(logical) TRUE if the model has an additive error model and FALSE otherwise

# See Also

has\_proportional\_error\_model : Check if a model has a proportional error model

has\_combined\_error\_model : Check if a model has a combined error model

has\_weighted\_error\_model: Check if a model has a weighted error model

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
has_additive_error_model(model)
## End(Not run)</pre>
```

has\_combined\_error\_model

has\_combined\_error\_model

### **Description**

Check if a model has a combined additive and proportional error model

Multiple dependent variables are supported. By default the only (in case of one) or the first (in case of many) dependent variable is going to be checked.

#### Usage

```
has_combined_error_model(model, dv = NULL)
```

### **Arguments**

model (Model) The model to check

dv (str or Expr or numeric (optional)) Name or DVID of dependent variable. NULL

for the default (first or only)

#### Value

(logical) TRUE if the model has a combined error model and FALSE otherwise

#### See Also

```
has_additive_error_model: Check if a model has an additive error model has_proportional_error_model: Check if a model has a proportional error model has_weighted_error_model: Check if a model has a weighted error model
```

```
## Not run:
model <- load_example_model("pheno")
has_combined_error_model(model)
## End(Not run)</pre>
```

has\_covariate\_effect 101

# Description

Tests if an instance of :class:pharmpy.model has a given covariate effect.

### Usage

```
has_covariate_effect(model, parameter, covariate)
```

#### **Arguments**

model (Model) Pharmpy model to check for covariate effect.

parameter (str) Name of parameter. covariate (str) Name of covariate.

#### Value

(logical) Whether input model has a covariate effect of the input covariate on the input parameter.

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
has_covariate_effect(model, "CL", "APGR")
## End(Not run)</pre>
```

```
has_first_order_absorption
has_first_order_absorption
```

### **Description**

Check if ode system describes a first order absorption

Currently defined as the central compartment having a unidirectional input flow from another compartment (such as depot or transit)

### Usage

```
has_first_order_absorption(model)
```

### **Arguments**

model (Model) Pharmpy model

# Value

(Bool: TRUE if model has first order absorption)

```
has\_first\_order\_elimination \\ has\_first\_order\_elimination
```

# Description

Check if the model describes first order elimination

This function relies on heuristics and will not be able to detect all possible ways of coding the first order elimination.

# Usage

```
has_first_order_elimination(model)
```

#### **Arguments**

model (Model) Pharmpy model

#### Value

(logical) TRUE if model has describes first order elimination

```
## Not run:
model <- load_example_model("pheno")
has_first_order_elimination(model)
## End(Not run)</pre>
```

has\_instantaneous\_absorption

has\_instantaneous\_absorption

# Description

Check if ode system describes a instantaneous absorption

Defined as being a instantaneous dose directly into the central compartment

### Usage

```
has_instantaneous_absorption(model)
```

# Arguments

model

(Model) Pharmpy model

#### Value

(Bool: TRUE if model has instantaneous absorption)

has\_linear\_odes

has\_linear\_odes

### **Description**

Check if model has a linear ODE system

### Usage

```
has_linear_odes(model)
```

### Arguments

model

(Model) Pharmpy model

### Value

(logical) TRUE if model has an ODE system that is linear

#### See Also

has\_odes

has\_linear\_odes\_with\_real\_eigenvalues

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
has_linear_odes(model)
## End(Not run)</pre>
```

```
has\_linear\_odes\_with\_real\_eigenvalues \\ has\_linear\_odes\_with\_real\_eigenvalues
```

### **Description**

Check if model has a linear ode system with real eigenvalues

# Usage

```
has_linear_odes_with_real_eigenvalues(model)
```

### **Arguments**

```
model (Model) Pharmpy model
```

#### Value

(logical) TRUE if model has an ODE system that is linear

# See Also

```
has_odes
has_linear_odes
```

```
## Not run:
model <- load_example_model("pheno")
has_linear_odes_with_real_eigenvalues(model)
## End(Not run)</pre>
```

```
has_michaelis_menten_elimination
```

has\_michaelis\_menten\_elimination

### **Description**

Check if the model describes Michaelis-Menten elimination

This function relies on heuristics and will not be able to detect all possible ways of coding the Michaelis-Menten elimination.

#### Usage

```
has_michaelis_menten_elimination(model)
```

### **Arguments**

mode1

(Model) Pharmpy model

#### Value

(logical) TRUE if model has describes Michaelis-Menten elimination

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
has_michaelis_menten_elimination(model)
model <- set_michaelis_menten_elimination(model)
has_michaelis_menten_elimination(model)
## End(Not run)</pre>
```

```
has_mixed_mm_fo_elimination
```

has\_mixed\_mm\_fo\_elimination

#### **Description**

Check if the model describes mixed Michaelis-Menten and first order elimination

This function relies on heuristics and will not be able to detect all possible ways of coding the mixed Michalis-Menten and first order elimination.

#### Usage

```
has_mixed_mm_fo_elimination(model)
```

106 has\_mu\_reference

### **Arguments**

mode1

(Model) Pharmpy model

# Value

(logical) TRUE if model has describes Michaelis-Menten elimination

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
has_mixed_mm_fo_elimination(model)
model <- set_mixed_mm_fo_elimination(model)
has_mixed_mm_fo_elimination(model)
## End(Not run)</pre>
```

has\_mu\_reference

has\_mu\_reference

# Description

Check if model is Mu-reference or not.

Will return TRUE if each parameter with an ETA is dependent on a Mu parameter.

# Usage

```
has_mu_reference(model)
```

# Arguments

model

(Model) Pharmpy model object

### Value

(logical) Whether the model is mu referenced

has\_odes 107

has\_odes

has\_odes

### **Description**

Check if model has an ODE system

# Usage

```
has_odes(model)
```

### **Arguments**

model

(Model) Pharmpy model

#### Value

(logical) TRUE if model has an ODE system

#### See Also

```
has_linear_odes
has_linear_odes_with_real_eigenvalues
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
has_odes(model)
## End(Not run)</pre>
```

has\_presystemic\_metabolite

has\_presystemic\_metabolite

### **Description**

Checks whether a model has a presystemic metabolite

If pre-systemic drug there will be a flow from DEPOT to METABOLITE as well as being a flow from the CENTRAL to METABOLITE

# Usage

```
has_presystemic_metabolite(model)
```

#### **Arguments**

model

(Model) Pharmpy model

#### Value

(logical) Whether a model has presystemic metabolite

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- add_metabolite(model, presystemic=TRUE)
has_presystemic_metabolite(model)
## End(Not run)</pre>
```

```
has_proportional_error_model
```

has\_proportional\_error\_model

### **Description**

Check if a model has a proportional error model

Multiple dependent variables are supported. By default the only (in case of one) or the first (in case of many) dependent variable is going to be checked.

### Usage

```
has_proportional_error_model(model, dv = NULL)
```

### **Arguments**

model (Model) The model to check

dv (str or Expr or numeric (optional)) Name or DVID of dependent variable. NULL

for the default (first or only)

#### Value

(logical) TRUE if the model has a proportional error model and FALSE otherwise

#### See Also

```
has_additive_error_model: Check if a model has an additive error model has_combined_error_model: Check if a model has a combined error model has_weighted_error_model: Check if a model has a weighted error model
```

has\_random\_effect 109

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
has_proportional_error_model(model)
## End(Not run)</pre>
```

has\_random\_effect

has\_random\_effect

### **Description**

Decides whether the given parameter of a :class:pharmpy.model has a random effect.

### Usage

```
has_random_effect(model, parameter, level = "all")
```

### **Arguments**

model (Model) Input Pharmpy model

parameter (str) Input parameter

level (str) The variability level to look for: 'iiv', 'iov', or 'all' (default)

### Value

(logical) Whether the given parameter has a random effect

#### See Also

```
get_individual_parameters
get_rv_parameters
```

```
## Not run:
model <- load_example_model("pheno")
has_random_effect(model, 'S1')
has_random_effect(model, 'CL', 'iiv')
has_random_effect(model, 'CL', 'iov')
## End(Not run)</pre>
```

has\_seq\_zo\_fo\_absorption

has\_seq\_zo\_fo\_absorption

# Description

Check if ode system describes a sequential zero-order, first-order absorption Defined as the model having both zero- and first-order absorption.

# Usage

```
has_seq_zo_fo_absorption(model)
```

# Arguments

model

(Model) DPharmpy model

#### See Also

```
has_zero_order_absorption
has_first_order_absorption
```

```
has_weighted_error_model
```

has\_weighted\_error\_model

# Description

Check if a model has a weighted error model

## Usage

```
has_weighted_error_model(model)
```

# Arguments

model

(Model) The model to check

#### Value

(logical) TRUE if the model has a weighted error model and FALSE otherwise

#### See Also

```
has_additive_error_model: Check if a model has an additive error model
has_combined_error_model: Check if a model has a combined error model
has_proportional_error_model: Check if a model has a proportional error model
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
has_weighted_error_model(model)
## End(Not run)</pre>
```

```
has_zero_order_absorption
```

has\_zero\_order\_absorption

# Description

Check if ode system describes a zero order absorption currently defined as having Infusion dose with rate not in dataset

### Usage

```
has_zero_order_absorption(model)
```

### Arguments

model

(Model) Pharmpy model

#### Value

(logical) Whether the model has zero order absorption or not

```
## Not run:
model <- load_example_model("pheno")
has_zero_order_absorption(model)
## End(Not run)</pre>
```

install\_pharmpy

```
has\_zero\_order\_elimination \\ has\_zero\_order\_elimination
```

### **Description**

Check if the model describes zero-order elimination

This function relies on heuristics and will not be able to detect all possible ways of coding the zero-order elimination.

### Usage

```
has_zero_order_elimination(model)
```

# **Arguments**

model

(Model) Pharmpy model

#### Value

(logical) TRUE if model has describes zero order elimination

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
has_zero_order_elimination(model)
model <- set_zero_order_elimination(model)
has_zero_order_elimination(model)
## End(Not run)</pre>
```

install\_pharmpy

Install Pharmpy

### **Description**

Install the pharmpy-core python package into virtual environment. Uses the same Pharmpy version as pharmr.

# Usage

```
install_pharmpy(envname = "r-reticulate", method = "auto")
```

install\_pharmpy\_devel 113

# Arguments

envname (str) name of environment. Default is r-reticulate

method (str) type of environment type (virtualenv, conda). Default is auto (virtualenv is

not available on Windows)

install\_pharmpy\_devel Install Pharmpy (with specified version)

# **Description**

Install the pharmpy-core python package into virtual environment.

### Usage

```
install_pharmpy_devel(
  envname = "r-reticulate",
  method = "auto",
  version = "devel"
)
```

# **Arguments**

envname (str) name of environment. Default is r-reticulate

method (str) type of environment type (virtualenv, conda). Default is auto (virtualenv is

not available on Windows)

version (str) which pharmpy version to use (use 'same' for most cases)

is\_linearized is\_linearized

### **Description**

Determine if a model is linearized

# Usage

```
is_linearized(model)
```

#### **Arguments**

model (Model) Pharmpy model

#### Value

(logical) TRUE if model has been linearized and FALSE otherwise

is\_real is\_real

# **Examples**

```
## Not run:
model1 <- load_example_model("pheno")
is_linearized(model1)
model2 <- load_example_model("pheno_linear")
is_linearized(model2)
## End(Not run)</pre>
```

is\_real

 $is\_real$ 

# Description

Determine if an expression is real valued given constraints of a model

### Usage

```
is_real(model, expr)
```

# Arguments

model (Model) Pharmpy model
expr (numeric or str or Expr) Expression to test

# Value

(logical or NULL) TRUE if expression is real, FALSE if not and NULL if unknown

```
## Not run:
model <- load_example_model("pheno")
is_real(model, "CL")
## End(Not run)</pre>
```

is\_strictness\_fulfilled 115

# Description

Takes a ModelfitResults object and a statement as input and returns TRUE/FALSE if the evaluation of the statement is TRUE/FALSE.

### Usage

```
is_strictness_fulfilled(model, results, strictness)
```

### **Arguments**

model (Model) Model for parameter specific strictness.
results (ModelfitResults) ModelfitResults object

strictness (str) A strictness expression

#### Value

(logical) A logical indicating whether the strictness criteria are fulfilled or not.

### **Examples**

```
## Not run:
res <- load_example_modelfit_results('pheno')
model <- load_example_model('pheno')
is_strictness_fulfilled(model, res, "minimization_successful or rounding_errors")
## End(Not run)</pre>
```

### Description

Return a vector of names of all time varying covariates

## Usage

```
list_time_varying_covariates(model)
```

116 load\_dataset

### **Arguments**

model

(Model) Pharmpy model

#### Value

(vector) Names of all time varying covariates

#### See Also

```
get_covariate_baselines : get baselines for all covariates
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
list_time_varying_covariates(model)
## End(Not run)</pre>
```

load\_dataset

load\_dataset

# Description

Load the dataset given datainfo

# Usage

```
load_dataset(model)
```

# Arguments

model

(Model) Pharmpy model

#### Value

(Model) Pharmpy model with dataset removed

```
## Not run:
model <- load_example_model("pheno")
model <- unload_dataset(model)
model$dataset is NULL
model <- load_dataset(model)
model$dataset
## End(Not run)</pre>
```

load\_example\_model 117

load\_example\_model

load\_example\_model

# Description

Load an example model

Load an example model from models built into Pharmpy

# Usage

```
load_example_model(name)
```

### **Arguments**

name

(str) Name of the model. Currently available models are "pheno" and "pheno\_linear"

#### Value

(Model) Loaded model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$statements
## End(Not run)</pre>
```

```
load_example_modelfit_results
```

load\_example\_modelfit\_results

# **Description**

Load the modelfit results of an example model

Load the modelfit results of an example model built into Pharmpy

### Usage

```
load_example_modelfit_results(name)
```

### **Arguments**

name

(str) Name of the model. Currently available models are "pheno" and "pheno\_linear"

118 make\_declarative

### Value

(ModelfitResults) Loaded modelfit results object

# **Examples**

```
## Not run:
results <- load_example_modelfit_results("pheno")
results$parameter_estimates
## End(Not run)</pre>
```

make\_declarative

make\_declarative

# Description

Make the model statments declarative

Each symbol will only be declared once.

### Usage

```
make_declarative(model)
```

### **Arguments**

model

(Model) Pharmpy model

## Value

(Model) Pharmpy model object

```
## Not run:
model <- load_example_model("pheno")
model$statements$before_odes
model <- make_declarative(model)
model$statements$before_odes

## End(Not run)</pre>
```

mu\_reference\_model 119

mu\_reference\_model

mu\_reference\_model

### **Description**

Convert model to use mu-referencing

Mu-referencing an eta is to separately define its actual mu (mean) parameter. For example: (equation could not be rendered, see API doc on website) normal distribution would give (equation could not be rendered, see API doc on website) (equation could not be rendered, see API doc on website)

### Usage

```
mu_reference_model(model)
```

### **Arguments**

model

(Model) Pharmpy model object

#### Value

(Model) Pharmpy model object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- mu_reference_model(model)
model$statements$before_odes
## End(Not run)</pre>
```

omit\_data

omit\_data

#### **Description**

Iterate over omissions of a certain group in a dataset. One group is omitted at a time.

#### Usage

```
omit_data(dataset_or_model, group, name_pattern = "omitted_{{}}")
```

# Arguments

```
dataset_or_model
```

(data.frame or Model) Dataset or model for which to omit records

group (str) Name of the column to use for grouping

name\_pattern (str) Name to use for generated datasets. A number starting from 1 will be put

in the placeholder.

#### Value

(iterator) Iterator yielding tuples of models/dataframes and the omitted group

### **Description**

Plot \|CWRES\| vs IPRED

# Usage

```
plot_abs_cwres_vs_ipred(
  model,
  predictions,
  residuals,
  stratify_on = NULL,
  bins = 8
)
```

# Arguments

model (Model) Pharmpy model

predictions (data.frame) DataFrame containing the predictions

residuals (data.frame) DataFrame containing the residuals

stratify\_on (str (optional)) Name of parameter for stratification

bins (numeric) Number of bins for stratification

#### Value

```
(alt.Chart) Plot
```

plot\_cwres\_vs\_idv 121

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_abs_cwres_vs_ipred(model, res$predictions, res$residuals)
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_abs_cwres_vs_ipred(model, res$predictions, res$residuals, 'WGT', bins=4)
## End(Not run)</pre>
```

plot\_cwres\_vs\_idv

plot\_cwres\_vs\_idv

### Description

Plot CWRES vs idv

#### Usage

```
plot_cwres_vs_idv(model, residuals, stratify_on = NULL, bins = 8)
```

#### **Arguments**

model (Model) Pharmpy model

residuals (data.frame) DataFrame containing CWRES

stratify\_on (str (optional)) Name of parameter for stratification

bins (numeric) Number of bins for stratification

#### Value

```
(alt.Chart) Plot
```

```
## Not run:
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_cwres_vs_idv(model, res$residuals)
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_cwres_vs_idv(model, res$residuals, 'WGT', bins=4)
## End(Not run)</pre>
```

plot\_dv\_vs\_pred

## **Description**

Plot DV vs IPRED

### Usage

```
plot_dv_vs_ipred(model, predictions, stratify_on = NULL, bins = 8)
```

### **Arguments**

```
model (Model) Pharmpy model
```

predictions (data.frame) DataFrame containing the predictions stratify\_on (str (optional)) Name of parameter for stratification

bins (numeric) Number of bins for stratification

#### Value

```
(alt.Chart) Plot
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_dv_vs_ipred(model, res$predictions)
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_dv_vs_ipred(model, res$predictions, 'WGT', bins=4)
## End(Not run)</pre>
```

```
plot_dv_vs_pred plot_dv_vs_pred
```

### **Description**

Plot DV vs PRED

## Usage

```
plot_dv_vs_pred(model, predictions, stratify_on = NULL, bins = 8)
```

plot\_eta\_distributions 123

### **Arguments**

model (Model) Pharmpy model

predictions (data.frame) DataFrame containing the predictions stratify\_on (str (optional)) Name of parameter for stratification

bins (numeric) Number of bins for stratification

#### Value

```
(alt.Chart) Plot
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_dv_vs_pred(model, res$predictions)
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_dv_vs_pred(model, res$predictions, 'WGT', bins=4)
## End(Not run)</pre>
```

```
plot_eta_distributions
```

plot\_eta\_distributions

# Description

Plot eta distributions for all etas

#### Usage

```
plot_eta_distributions(model, individual_estimates)
```

### **Arguments**

```
model (Model) Previously run Pharmpy model.
individual_estimates
(data.frame) Individual estimates for etas
```

#### Value

```
(alt.Chart) Plot
```

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_eta_distributions(model, res$individual_estimates)
## End(Not run)</pre>
```

# Description

Plot DV and predictions grouped on individuals

### Usage

```
plot_individual_predictions(model, predictions, individuals = NULL)
```

### **Arguments**

model (Model) Previously run Pharmpy model.

predictions (data.frame) One column for each type of prediction

individuals (array(numeric) (optional)) A vector of individuals to include. NULL for all

individuals

#### Value

```
(alt.Chart) Plot
```

```
## Not run:
model <- load_example_model("pheno")
res <- load_example_modelfit_results("pheno")
plot_individual_predictions(model, res$predictions, individuals=c(1, 2, 3, 4, 5))
## End(Not run)</pre>
```

plot\_iofv\_vs\_iofv 125

### **Description**

Plot individual OFV of two models against each other

#### Usage

```
plot_iofv_vs_iofv(iofv1, iofv2, name1, name2)
```

### **Arguments**

```
iofv1 (array) Estimated iOFV of the first modeliofv2 (array) Estimated iOFV of the second modelname1 (str) Name of first modelname2 (str) Name of second model
```

#### Value

```
(alt.Chart) Scatterplot
```

# **Examples**

```
## Not run:
res1 <- load_example_modelfit_results("pheno")
res2 <- load_example_modelfit_results("pheno_linear")
plot_iofv_vs_iofv(res1$individual_ofv, res2$individual_ofv, "nonlin", "linear")
## End(Not run)</pre>
```

```
plot\_transformed\_eta\_distributions \\ plot\_transformed\_eta\_distributions
```

# Description

Plot transformed eta distributions for all transformed etas

# Usage

```
plot_transformed_eta_distributions(
  model,
  parameter_estimates,
  individual_estimates
)
```

126 plot\_vpc

# **Arguments**

#### Value

```
(alt.Chart) Plot
```

plot\_vpc

plot\_vpc

# Description

Creates a VPC plot for a model

# Usage

```
plot_vpc(
  model,
  simulations,
  binning = "equal_number",
  nbins = 8,
  qi = 0.95,
  ci = 0.95,
  stratify_on = NULL
)
```

# **Arguments**

model (Model) Pharmpy model

simulations (data.frame or str) DataFrame containing the simulation data or path to dataset.

The dataset has to have one (index) column named "SIM" containing the simulation number, one (index) column named "index" containing the data indices

and one dv column. See below for more information.

binning (str) Binning method. Can be "equal\_number" or "equal\_width". The default is

"equal\_number".

nbins (numeric) Number of bins. Default is 8.
qi (numeric) Upper quantile. Default is 0.95.
ci (numeric) Confidence interval. Default is 0.95.

stratify\_on (str (optional)) Parameter to use for stratification. Optional.

#### Value

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
sim_model <- set_simulation(model, n=100)
sim_data <- run_simulation(sim_model)
plot_vpc(model, sim_data)
## End(Not run)</pre>
```

#### **Description**

Predict influential individuals for a model using a machine learning model.

Please refer to www.page-meeting.org/?abstract=10029 for more information on training and estimated precision and accuracy.

#### Usage

```
predict_influential_individuals(model, results, cutoff = 3.84)
```

## **Arguments**

model (Model) Pharmpy model

 $results \qquad \qquad (Model fit Results) \ Results \ for \ model$ 

cutoff (numeric) Cutoff threshold for a dofv signalling an influential individual

#### Value

(data.frame) Dataframe over the individuals with a dofv column containing the raw predicted delta-OFV and an influential column with a boolean to tell whether the individual is influential or not.

#### See Also

```
predict_influential_outliers
predict_outliers
```

# Description

Predict influential outliers for a model using a machine learning model.

Please refer to www.page-meeting.org/?abstract=10029 for more information on training and estimated precision and accuracy.

### Usage

```
predict_influential_outliers(
  model,
  results,
  outlier_cutoff = 3,
  influential_cutoff = 3.84
)
```

# **Arguments**

```
model (Model) Pharmpy model

results (ModelfitResults) Results for model

outlier_cutoff (numeric) Cutoff threshold for a residual signaling an outlier

influential_cutoff

(numeric) Cutoff threshold for a dofv signaling an influential individual
```

### Value

(data.frame) Dataframe over the individuals with a outliers and dofv columns containing the raw predictions and influential, outlier and influential\_outlier boolean columns.

### See Also

```
predict_influential_individuals
predict_outliers
```

predict\_outliers 129

predict_outliers	predict_outliers
------------------	------------------

# **Description**

Predict outliers for a model using a machine learning model.

See the :ref:simeval <Individual OFV summary> documentation for a definition of the residual

Please refer to www.page-meeting.org/?abstract=10029 for more information on training and estimated precision and accuracy.

### Usage

```
predict_outliers(model, results, cutoff = 3)
```

### **Arguments**

model (Model) Pharmpy model

results (ModelfitResults) ModelfitResults for the model

cutoff (numeric) Cutoff threshold for a residual signaling an outlier

## Value

(data.frame) Dataframe over the individuals with a residual column containing the raw predicted residuals and a outlier column with a boolean to tell whether the individual is an outlier or not.

#### See Also

```
predict_influential_individuals
predict_influential_outliers
```

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
predict_outliers(model, results)
## End(Not run)</pre>
```

print\_log

```
print_fit_summary
```

print\_fit\_summary

# Description

Print a summary of the model fit

# Usage

```
print_fit_summary(model, modelfit_results)
```

# Arguments

```
\begin{tabular}{ll} model & (Model) Pharmpy model object \\ model fit_results \\ & (Model fitResults) Pharmpy Model fitResults object \\ \end{tabular}
```

print\_log

print\_log

# Description

Print the log of a context

# Usage

```
print_log(context)
```

# Arguments

context

(Context) Print the log of this context

print\_model\_code 131

print\_model\_code

print\_model\_code

### **Description**

Print the model code of the underlying model language to the console

# Usage

```
print_model_code(model)
```

### **Arguments**

model

(Model) Pharmpy model

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
print_model_code(model)
## End(Not run)</pre>
```

```
print_model_symbols
```

print\_model\_symbols

# Description

Print all symbols defined in a model

Symbols will be in one of the categories thetas, etas, omegas, epsilons, sigmas, variables and data columns

# Usage

```
print_model_symbols(model)
```

# Arguments

model

(Model) Pharmpy model object

```
## Not run:
model <- load_example_model("pheno")
print_model_symbols(model)
## End(Not run)</pre>
```

print\_pharmpy\_version Print pharmpy version

# Description

Print the pharmpy version pharmr uses.

# Usage

```
print_pharmpy_version()
```

# Description

Read a dataset given a datainfo object or path to a datainfo file

### Usage

```
read_dataset_from_datainfo(datainfo, datatype = NULL)
```

# **Arguments**

datainfo (DataInfo or str) A datainfo object or a path to a datainfo object

datatype (str (optional)) A string to specify dataset type

### Value

(data.frame) The dataset

read\_model 133

read\_model

read\_model

### **Description**

Read model from file

### Usage

```
read_model(path, missing_data_token = NULL)
```

### **Arguments**

```
path (str) Path to model missing_data_token
```

(str (optional)) Use this token for missing data. This option will override the token from the config. (This option was added in Pharmpy version 1.2.0)

#### Value

(Model) Read model object

### See Also

```
read_model_from_database : Read model from database read_model_from_string : Read model from string
```

# **Examples**

```
## Not run:
model <- read_model("/home/run1$mod")
## End(Not run)</pre>
```

```
read_modelfit_results read_modelfit_results
```

### Description

Read results from external tool for a model

## Usage

```
read_modelfit_results(path, esttool = NULL)
```

### **Arguments**

path (str) Path to model file

esttool (str) Set if other than the default estimation tool is to be used

### Value

```
(ModelfitResults) Results object
```

# Description

Read model from the model code in a string

### Usage

```
read_model_from_string(code)
```

# **Arguments**

code (str) Model code to read

# Value

(Model) Pharmpy model object

#### See Also

```
read_model : Read model from file
read_model_from_database : Read model from database
```

```
## Not run:
s <- "$PROBLEM
$INPUT ID DV TIME
$DATA file$csv
$PRED
Y=THETA(1)+ETA(1)+ERR(1)
$THETA 1
$OMEGA 0.1
$SIGMA 1
$ESTIMATION METHOD=1"
read_model_from_string(s)
## End(Not run)</pre>
```

read\_results 135

read\_results

read\_results

# Description

Read results object from file

# Usage

```
read_results(path)
```

# Arguments

path

(str) Path to results file

### Value

(Results) Results object for tool

### See Also

create\_results

# **Examples**

```
## Not run:
res <- read_results("results$json")
## End(Not run)</pre>
```

remove\_bioavailability

remove\_bioavailability

# Description

Remove bioavailability from the first dose compartment of model.

# Usage

```
remove_bioavailability(model)
```

## **Arguments**

model

(Model) Pharmpy model

### Value

```
(Model) Pharmpy model object
```

#### See Also

```
set_bioavailability
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- remove_bioavailability(model)
## End(Not run)</pre>
```

```
remove_covariate_effect
```

remove\_covariate\_effect

# Description

Remove a covariate effect from an instance of :class:pharmpy.model.

# Usage

```
remove_covariate_effect(model, parameter, covariate)
```

# Arguments

model (Model) Pharmpy model from which to remove the covariate effect.

parameter (str) Name of parameter. covariate (str) Name of covariate.

#### Value

(Model) Pharmpy model object

```
## Not run:
model <- load_example_model("pheno")
has_covariate_effect(model, "CL", "WGT")
model <- remove_covariate_effect(model, "CL", "WGT")
has_covariate_effect(model, "CL", "WGT")
## End(Not run)</pre>
```

remove\_derivative 137

remove\_derivative

remove\_derivative

#### **Description**

Remove a derivative currently being calculcate when running model. Currently, only derivatives with respect to the prediction is supported. Default is to remove all that are present, First order derivates are specied either by single string or single-element tuple. For instance with\_respect\_to = "ETA\_1" or with\_respect\_to = ("ETA\_1",)

Second order derivatives are specified by giving the two independent varibles in a tuple of tuples. For instance with\_respect\_to ((ETA\_1, EPS\_1),)

Multiple derivatives can be specified within a tuple. For instance ((ETA\_1, EPS\_1), "ETA\_1")

Currently, only ETAs and EPSILONs are supported

### Usage

```
remove_derivative(model, with_respect_to = NULL)
```

# **Arguments**

```
model (Model) Pharmpy modeas.

with_respect_to

(array(array(str) or str) or str (optional)) Parameter name(s) to use as independent variables. Default is NULL.
```

### Value

(Pharmpy model.)

remove\_error\_model

remove\_error\_model

#### **Description**

Remove error model.

# Usage

```
remove_error_model(model)
```

## **Arguments**

model

(Model) Remove error model for this model

### Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$statements$find_assignment("Y")
model <- remove_error_model(model)
model$statements$find_assignment("Y")
## End(Not run)</pre>
```

```
remove\_estimation\_step \\ remove\_estimation\_step
```

# Description

Remove estimation step

## Usage

```
remove_estimation_step(model, idx)
```

#### **Arguments**

model (Model) Pharmpy model

idx (numeric) index of estimation step to remove (starting from 0)

### Value

(Model) Pharmpy model object

#### See Also

```
add_estimation_step
set_estimation_step
append_estimation_step_options
add_parameter_uncertainty_step
remove_parameter_uncertainty_step
set_evaluation_step
```

remove\_iiv 139

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- remove_estimation_step(model, 0)
ests <- model$execution_steps
length(ests)
## End(Not run)</pre>
```

remove\_iiv

remove\_iiv

# Description

Removes all IIV etas given a vector with eta names and/or parameter names.

# Usage

```
remove_iiv(model, to_remove = NULL)
```

## **Arguments**

model (Model) Pharmpy model to create block effect on.

to\_remove (array(str) or str (optional)) Name/names of etas and/or name/names of indi-

vidual parameters to remove. If NULL, all etas that are IIVs will be removed.

NULL is default.

#### Value

(Model) Pharmpy model object

### See Also

```
remove_iov
add_iiv
add_iov
add_pk_iiv
```

```
## Not run:
model <- load_example_model("pheno")
model <- remove_iiv(model)
model$statements$find_assignment("CL")
model <- load_example_model("pheno")
model <- remove_iiv(model, "VC")
model$statements$find_assignment("VC")
## End(Not run)</pre>
```

remove\_iov

# Description

Removes all IOV etas given a vector with eta names.

# Usage

```
remove_iov(model, to_remove = NULL)
```

# Arguments

model (Model) Pharmpy model to remove IOV from.

to\_remove (array(str) or str (optional)) Name/names of IOV etas to remove, e.g. 'ETA\_IOV\_1\_1'.

If NULL, all etas that are IOVs will be removed. NULL is default.

# Value

(Model) Pharmpy model object

# See Also

```
add_iiv
add_iov
remove_iiv
add_pk_iiv
```

```
## Not run:
model <- load_example_model("pheno")
model <- remove_iov(model)
## End(Not run)</pre>
```

remove\_lag\_time 141

remove\_lag\_time

remove\_lag\_time

# Description

Remove lag time from the dose compartment of model.

# Usage

```
remove_lag_time(model)
```

### **Arguments**

model

(Model) Pharmpy model

### Value

(Model) Pharmpy model object

#### See Also

```
set_transit_compartments add_lag_time
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- remove_lag_time(model)
## End(Not run)</pre>
```

remove\_loq\_data

remove\_loq\_data

# Description

Remove loq data records from the dataset

Does nothing if none of the limits are specified.

remove\_loq\_data

# Usage

```
remove_loq_data(
  model,
  lloq = NULL,
  uloq = NULL,
  blq = NULL,
  alq = NULL,
  keep = 0
)
```

# Arguments

model	(Model) Pharmpy model object
lloq	(numeric or str (optional)) Value or column name for lower limit of quantification.
uloq	(numeric or str (optional)) Value or column name for upper limit of quantification.
blq	(str (optional)) Column name for below limit of quantification indicator.
alq	(str (optional)) Column name for above limit of quantification indicator.
keep	(numeric) Number of loq records to keep for each run of consecutive loq records.

# Value

(Model) Pharmpy model object

# See Also

```
set_lloq_data
transform_blq
```

```
## Not run:
model <- load_example_model("pheno")
model <- remove_loq_data(model, lloq=10, uloq=40)
length(model$dataset)
## End(Not run)</pre>
```

### **Description**

Removes parameter uncertainty step from the final estimation step

### Usage

```
remove_parameter_uncertainty_step(model)
```

### **Arguments**

```
model (Model) Pharmpy model
```

### Value

```
(Model) Pharmpy model object
```

### See Also

```
add_estimation_step
set_estimation_step
remove_estimation_step
append_estimation_step_options
add_parameter_uncertainty_step
set_evaluation_step
```

```
## Not run:
model <- load_example_model("pheno")
model <- remove_parameter_uncertainty_step(model)
ests <- model$execution_steps
ests[1]
## End(Not run)</pre>
```

```
remove_peripheral_compartment 
 remove_peripheral_compartment
```

# Description

Remove a peripheral distribution compartment from model

If name is set, a peripheral compartment will be removed from the compartment with the specified name.

Initial estimates:

### Usage

```
remove_peripheral_compartment(model, name = NULL)
```

#### **Arguments**

model (Model) Pharmpy model

name (str) Name of compartment to remove peripheral compartment from.

#### Value

```
(Model) Pharmpy model object
```

### See Also

```
set_peripheral_compartment
add_peripheral_compartment
```

```
## Not run:
model <- load_example_model("pheno")
model <- set_peripheral_compartments(model, 2)
model <- remove_peripheral_compartment(model)
model$statements$ode_system
## End(Not run)</pre>
```

remove\_predictions 145

remove\_predictions

remove\_predictions

## Description

Remove predictions and/or residuals

Remove predictions from estimation step.

## Usage

```
remove_predictions(model, to_remove = NULL)
```

## **Arguments**

model (Model) Pharmpy model

to\_remove (array(str) (optional)) Predictions to remove

#### Value

(Model) Pharmpy model object

## See Also

```
add_predictions
add_residuals
set_estimation_step
add_estimation_step
remove_estimation_step
append_estimation_step_options
add_parameter_uncertainty_step
remove_parameter_uncertainty_step
```

```
## Not run:
model <- load_example_model("pheno")
model <- remove_predictions(model)
model$execution_steps[-1].predictions
## End(Not run)</pre>
```

remove\_residuals

remove\_residuals

remove\_residuals

## Description

Remove residuals

Remove residuals from estimation step.

### Usage

```
remove_residuals(model, to_remove = NULL)
```

### **Arguments**

model (Model) Pharmpy model

to\_remove (array(str) (optional)) Residuals to remove

### Value

(Model) Pharmpy model object

## See Also

```
add_predictions
add_residuals
set_estimation_step
add_estimation_step
remove_estimation_step
append_estimation_step_options
add_parameter_uncertainty_step
remove_parameter_uncertainty_step
```

```
## Not run:
model <- load_example_model("pheno")
model <- remove_residuals(model)
model$execution_steps[-1].residuals
## End(Not run)</pre>
```

```
remove\_unused\_parameters\_and\_rvs \\ remove\_unused\_parameters\_and\_rvs
```

## Description

Remove any parameters and rvs that are not used in the model statements

## Usage

```
remove_unused_parameters_and_rvs(model)
```

### **Arguments**

model (Model) Pharmpy model object

#### Value

(Model) Pharmpy model object

rename\_symbols

rename\_symbols

## Description

Rename symbols in the model

Make sure that no name clash occur.

## Usage

```
rename_symbols(model, new_names)
```

### **Arguments**

model (Model) Pharmpy model object

new\_names (list(str or Expr=str or Expr)) From old name or symbol to new name or symbol

#### Value

(Model) Pharmpy model object

```
replace_fixed_thetas
```

## **Description**

Replace all fixed thetas with constants in the model statements

## Usage

```
replace_fixed_thetas(model)
```

## Arguments

model

(Model) Pharmpy model

#### Value

(Model) A new model

```
replace_non_random_rvs
```

replace\_non\_random\_rvs

## Description

Replace all random variables that are not actually random

Some random variables are constant. For example a normal distribution with the variance parameter fixed to 0 will always yield a single value when sampled. This function will find all such random variables and replace them with their constant value in the model.

## Usage

```
replace_non_random_rvs(model)
```

## **Arguments**

model

(Model) Pharmpy model

### Value

(Model) A new model

resample\_data 149

#### **Description**

Iterate over resamples of a dataset.

The dataset will be grouped on the group column then groups will be selected randomly with or without replacement to form a new dataset. The groups will be renumbered from 1 and upwards to keep them separated in the new dataset.

### Usage

```
resample_data(
  dataset_or_model,
  group,
  resamples = 1,
  stratify = NULL,
  sample_size = NULL,
  replace = FALSE,
  name_pattern = "resample_{{}}",
  name = NULL
)
```

## **Arguments**

dataset\_or\_model

(data.frame or Model) Dataset or Model to use

group (str) Name of column to group by

resamples (numeric) Number of resamples (iterations) to make

stratify (str (optional)) Name of column to use for stratification. The values in the strat-

ification column must be equal within a group so that the group can be uniquely

determined. A ValueError exception will be raised otherwise.

sample\_size (numeric (optional)) The number of groups that should be sampled. The default

is the number of groups. If using stratification the default is to sample using the proportion of the strata in the dataset. A list of specific sample sizes for each

stratum can also be supplied.

replace (logical) A boolean controlling whether sampling should be done with or with-

out replacement

name\_pattern (str) Name to use for generated datasets. A number starting from 1 will be put

in the placeholder.

name (str (optional)) Option to name pattern in case of only one resample

### Value

(iterator) An iterator yielding tuples of a resampled DataFrame and a vector of resampled groups in order

retrieve\_model

reset\_index

Reset index

## Description

Reset index of dataframe.

Reset index from a multi indexed data.frame so that index is added as columns

### Usage

```
reset_index(df)
```

## **Arguments**

df

A data.frame converted from python using reticulate

```
reset_indices_results Reset result indices
```

## **Description**

Resets indices in dataframes within Results-objects when needed

# Usage

```
reset_indices_results(res)
```

## Arguments

res

A Pharmpy results object

retrieve\_model

retrieve\_model

# Description

Retrieve a model from a context/tool run

Any models created and run by the tool can be retrieved.

## Usage

```
retrieve_model(source, name)
```

### **Arguments**

source (str or Context) Source where to find models. Can be a path (as str or Path), or a

Context

name (str) Name of the model

### Value

(Model) The model object

## **Examples**

```
## Not run:
tooldir_path <- 'path/to/tool/directory'
model <- retrieve_model(tooldir_path, 'run1')
## End(Not run)</pre>
```

retrieve\_modelfit\_results

retrieve\_modelfit\_results

#### **Description**

Retrieve the modelfit results of a model

### Usage

```
retrieve_modelfit_results(source, name)
```

### **Arguments**

source (str or Context) Source where to find models. Can be a path (as str or Path), or a

Context

name (str) Name of the model

#### Value

(ModelfitResults) The results object

```
## Not run:
tooldir_path <- 'path/to/tool/directory'
context <- create_context("iivsearch1")
results <- retrieve_modelfit_results(context, 'input')
## End(Not run)</pre>
```

run\_allometry

retrieve\_models

retrieve\_models

## Description

Retrieve models after a tool run

Any models created and run by the tool can be retrieved.

## Usage

```
retrieve_models(source, names = NULL)
```

## Arguments

source (str or Context) Source where to find models. Can be a path (as str or Path), or a

Context

names (array(str) (optional)) List of names of the models to retrieve or NULL for all

## Value

(vector) List of retrieved model objects

## **Examples**

```
## Not run:
tooldir_path <- 'path/to/tool/directory'
models <- retrieve_models(tooldir_path, names=c('run1'))
## End(Not run)</pre>
```

run\_allometry

run\_allometry

## Description

Run allometry tool. For more details, see :ref:allometry.

run\_allometry 153

#### Usage

```
run_allometry(
  model = NULL,
  results = NULL,
  allometric_variable = "WT",
  reference_value = 70,
  parameters = NULL,
  initials = NULL,
  lower_bounds = NULL,
  upper_bounds = NULL,
  fixed = TRUE,
  ...
)
```

#### **Arguments**

model (Model (optional)) Pharmpy model

results (ModelfitResults (optional)) Results for model

allometric\_variable

(str or Expr) Name of the variable to use for allometric scaling (default is WT)

reference\_value

(str or numeric or Expr) Reference value for the allometric variable (default is

70)

parameters (array(str or Expr) (optional)) Parameters to apply scaling to (default is all CL,

Q and V parameters)

initials (array(numeric) (optional)) Initial estimates for the exponents. (default is to use

0.75 for CL and Qs and 1 for Vs)

lower\_bounds (array(numeric) (optional)) Lower bounds for the exponents. (default is 0 for all

parameters)

upper\_bounds (array(numeric) (optional)) Upper bounds for the exponents. (default is 2 for all

parameters)

fixed (logical) Should the exponents be fixed or not. (default TRUE

... Arguments to pass to tool

#### Value

(AllometryResults) Allometry tool result object

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
run_allometry(model=model, results=results, allometric_variable='WGT')
## End(Not run)</pre>
```

run\_amd

 $run\_amd$   $run\_amd$ 

## **Description**

Run Automatic Model Development (AMD) tool

## Usage

```
run_amd(
  input,
  results = NULL,
 modeltype = "basic_pk",
  administration = "oral",
  strategy = "default",
  cl_init = NULL,
 vc_init = NULL,
 mat_init = NULL,
 b_init = NULL,
 emax_init = NULL,
  ec50_init = NULL,
 met_init = NULL,
  search_space = NULL,
  1log_method = NULL,
  lloq_limit = NULL,
  allometric_variable = NULL,
  occasion = NULL,
  path = NULL,
  resume = FALSE,
  strictness = "minimization_successful or (rounding_errors and sigdigs>=0.1)",
  dv_{types} = NULL,
 mechanistic_covariates = NULL,
  retries_strategy = "all_final",
  seed = NULL,
 parameter_uncertainty_method = NULL,
  ignore_datainfo_fallback = FALSE,
  .E = NULL
)
```

## **Arguments**

```
input (Model or str or data.frame) Starting model or dataset

results (ModelfitResults (optional)) Reults of input if input is a model

modeltype (str) Type of model to build. Valid strings are 'basic_pk', 'pkpd', 'drug_metabolite'
and 'tmdd'

administration (str) Route of administration. Either 'iv', 'oral' or 'ivoral'
```

run\_amd 155

strategy	(str) Run algorithm for AMD procedure. Valid options are 'default', 'reevaluation', 'SIR', 'SRI', and 'RSI'.
cl_init	(numeric (optional)) Initial estimate for the population clearance
vc_init	(numeric (optional)) Initial estimate for the central compartment population volume
mat_init	(numeric (optional)) Initial estimate for the mean absorption time (not for iv models)
b_init	(numeric (optional)) Initial estimate for the baseline (PKPD model)
emax_init	(numeric (optional)) Initial estimate for E_max (PKPD model)
ec50_init	(numeric (optional)) Initial estimate for EC_50 (PKPD model)
met_init	(numeric (optional)) Initial estimate for mean equilibration time (PKPD model)
search_space	(str (optional)) MFL for search space for structural and covariate model
lloq_method	(str (optional)) Method for how to remove LOQ data. See transform_blq for vector of available methods
lloq_limit	(numeric (optional)) Lower limit of quantification. If NULL LLOQ column from dataset will be used
allometric_var	
	(str or Expr (optional)) Variable to use for allometry. This option is deprecated. Please use ALLOMETRY in the mfl instead.
occasion	(str (optional)) Name of occasion column
path	(str (optional)) Path to run AMD in
resume	(logical) Whether to allow resuming previous run
strictness	(str (optional)) Strictness criteria
dv_types	(list(str=numeric) (optional)) Dictionary of DV types for TMDD models with multiple DVs.
mechanistic_co	
	(array(str or list(str)) (optional)) List of covariates or tuple of covariate and parameter combination to run in a separate proioritized covsearch run. For instance c("WT", ("CRCL", "CL")). The effects are extracted from the search space for covsearch.
retries_strategy	
	(str) Whether or not to run retries tool. Valid options are 'skip', 'all_final' or 'final'. Default is 'final'.
seed	(numeric (optional)) Random number generator or seed to be used.
parameter_unce	rtainty_method (str (optional)) Parameter uncertainty method.
ignore_datainf	
	(logical) Ignore using datainfo to get information not given by the user. Default is FALSE
.E	(list(str=numeric or str) (optional)) EXPERIMENTAL FEATURE. Dictionary of different F-values used in mBIC

of different E-values used in mBIC.

run\_bootstrap

### Value

```
(AMDResults) Results for the run
```

#### See Also

```
run_iiv
run_tool
```

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
res <- run_amd(model, results=results)
## End(Not run)</pre>
```

run\_bootstrap

run\_bootstrap

## Description

Run bootstrap tool

## Usage

```
run_bootstrap(model, results = NULL, resamples = 1, ...)
```

### **Arguments**

```
model (Model) Pharmpy model
results (ModelfitResults (optional)) Results for model
```

resamples (numeric) Number of bootstrap resample

... Arguments to pass to tool

#### Value

(BootstrapResults) Bootstrap tool result object

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
run_bootstrap(model, res, resamples=500)
## End(Not run)</pre>
```

run\_covsearch 157

run\_covsearch run\_covsearch

## Description

Run COVsearch tool. For more details, see :ref:covsearch.

### Usage

```
run_covsearch(
  search_space,
  p_forward = 0.01,
 p_backward = 0.001,
 max\_steps = -1,
 algorithm = "scm-forward-then-backward",
  results = NULL,
 model = NULL,
 max_eval = FALSE,
 adaptive_scope_reduction = FALSE,
  strictness = "minimization_successful or (rounding_errors and sigdigs>=0.1)",
  naming_index_offset = 0,
  nsamples = 10,
  .statsmodels = FALSE,
  .weighted_linreg = FALSE,
  .lin_filter = 0,
)
```

#### **Arguments**

search_space	(str or ModelFeatures) MFL of covariate effects to try
p_forward	(numeric) The p-value to use in the likelihood ratio test for forward steps
p_backward	(numeric) The p-value to use in the likelihood ratio test for backward steps
max_steps	(numeric) The maximum number of search steps to make
algorithm	(str) The search algorithm to use. Currently, 'scm-forward' and 'scm-forward-then-backward' are supported.
results	(ModelfitResults (optional)) Results of model
model	(Model (optional)) Pharmpy model
max_eval	(logical) Limit the number of function evaluations to 3.1 times that of the base model. Default is FALSE.
adaptive_scope_reduction	
	(logical) Stash all non-significant parameter-covariate effects to be tested after

(logical) Stash all non-significant parameter-covariate effects to be tested after all significant effects have been tested. Once all these have been tested, try adding the stashed effects once more with a regular forward approach. Default is FALSE

158 run\_estmethod

strictness (str (optional)) Strictness criteria

naming\_index\_offset

(numeric (optional)) index offset for naming of runs. Default is 0.

nsamples

(numeric) Number of samples from individual parameter conditional distribution for linear covariate model selection. nsamples=0 uses ETAs to for linear model selection, whereas nsample>=1 generates MCMC samples with an additional SAEM estimation step. When multiple samples are generated, linear mixed effects model will be used to fit the linear models. Default is 10, i.e.

generating 10 samples per subject

.statsmodels

(logical) Estimation tool for SAMBA linear covariate model fitting. 'TRUE' calls statsmodel's functionalities, whereas 'FALSE' calls nonmem.

.weighted\_linreg

(logical) When using nonmem to run linear covariate models, 'TRUE' uses ETC

as weight to run WLS.

.lin\_filter

(numeric) Option to control the number of covariates passed to nonlinear selec-

tion

... Arguments to pass to tool

#### Value

(COVSearchResults) COVsearch tool result object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
search_space <- 'COVARIATE(c(CL, V), c(AGE, WT), EXP)'
res <- run_covsearch(search_space, model=model, results=results)
## End(Not run)</pre>
```

run\_estmethod

run\_estmethod

#### **Description**

Run estmethod tool.

#### Usage

```
run_estmethod(
  algorithm,
  methods = NULL,
  solvers = NULL,
```

run\_estmethod 159

```
parameter_uncertainty_methods = NULL,
compare_ofv = TRUE,
results = NULL,
model = NULL,
...
)
```

### **Arguments**

algorithm (str) The algorithm to use (can be 'exhaustive', 'exhaustive\_with\_update' or

'exhaustive\_only\_eval')

methods (array(str) or str (optional)) List of estimation methods to test. Can be specified

as 'all', a vector of estimation methods, or NULL (to not test any estimation

method)

solvers (array(str) or str (optional)) List of solvers to test. Can be specified as 'all', a

vector of solvers, or NULL (to not test any solver)

parameter\_uncertainty\_methods

(array(str) or str (optional)) List of parameter uncertainty methods to test. Can be specified as 'all', a vector of uncertainty methods, or NULL (to not evaluate

any uncertainty)

compare\_ofv (logical) Whether to compare the OFV between candidates. Comparison is

made by evaluating using IMP

results (ModelfitResults (optional)) Results for model

model (Model (optional)) Pharmpy mode

... Arguments to pass to tool

#### Value

(EstMethodResults) Estmethod tool result object

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
methods <- c('IMP', 'SAEM')
parameter_uncertainty_methods <- NULL
run_estmethod(
  'reduced', methods=methods, solvers='all',
  parameter_uncertainty_methods=parameter_uncertainty_methods, results=results, model=model
)

## End(Not run)</pre>
```

run\_iivsearch

run\_iivsearch run\_iivsearch

### **Description**

Run IIV search tool. For more details, see :ref:iivsearch.

## Usage

```
run_iivsearch(
   algorithm = "top_down_exhaustive",
   iiv_strategy = "no_add",
   rank_type = "bic",
   linearize = FALSE,
   cutoff = NULL,
   results = NULL,
   model = NULL,
   keep = c("CL"),
   strictness = "minimization_successful or (rounding_errors and sigdigs>=0.1)",
   correlation_algorithm = NULL,
   E_p = NULL,
   E_q = NULL,
   ...
)
```

# Arguments

	algorithm	(str) Which algorithm to run when determining number of IIVs.
	iiv_strategy	(str) If/how IIV should be added to start model. Default is 'no_add'.
	rank_type	(str) Which ranking type should be used. Default is BIC.
	linearize	(logical) Wheter or not use linearization when running the tool.
	cutoff	(numeric (optional)) Cutoff for which value of the ranking function that is considered significant. Default is NULL (all models will be ranked)
	results	(ModelfitResults (optional)) Results for model
	model	(Model (optional)) Pharmpy model
	keep	(array(str) (optional)) List of IIVs to keep. Default is "CL"
	strictness	(str (optional)) Strictness criteria
correlation_algorithm		
		(str (optional)) Which algorithm to run for the determining block structure of added IIVs. If NULL, the algorithm is determined based on the 'algorithm' argument
	E_p	(numeric or str (optional)) Expected number of predictors for diagonal elements (used for mBIC). Must be set when using mBIC and when the argument 'algorithm' is not 'skip'

run\_iovsearch 161

E\_q (numeric or str (optional)) Expected number of predictors for off-diagonal elements (used for mBIC). Must be set when using mBIC and when the argument correlation\_algorithm is not skip or Non

... Arguments to pass to tool

#### Value

(IIVSearchResults) IIVsearch tool result object

## Examples

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
run_iivsearch('td_brute_force', results=results, model=model)
## End(Not run)</pre>
```

run\_iovsearch

run\_iovsearch

### **Description**

Run IOV search tool. For more details, see :ref:iovsearch.

## Usage

```
run_iovsearch(
  column = "OCC",
  list_of_parameters = NULL,
  rank_type = "bic",
  cutoff = NULL,
  distribution = "same-as-iiv",
  results = NULL,
  model = NULL,
  strictness = "minimization_successful or (rounding_errors and sigdigs>=0.1)",
  E = NULL,
  ...
)
```

#### **Arguments**

```
column (str) Name of column in dataset to use as occasion column (default is 'OCC') list_of_parameters
```

(array(str or array(str)) (optional)) List of parameters to test IOV on, if none all parameters with IIV will be tested (default)

run\_linearize

rank\_type (str) Which ranking type should be used. Default is BIC.

cutoff (numeric (optional)) Cutoff for which value of the ranking type that is consid-

ered significant. Default is NULL (all models will be ranked)

distribution (str) Which distribution added IOVs should have (default is same-as-iiv)

results (ModelfitResults (optional)) Results for model

model (Model (optional)) Pharmpy model strictness (str (optional)) Strictness criteria

E (numeric or str (optional)) Expected number of predictors (used for mBIC).

Must be set when using mBI

... Arguments to pass to tool

#### Value

(IOVSearchResults) IOVSearch tool result object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
run_iovsearch('OCC', results=results, model=model)
## End(Not run)</pre>
```

run\_linearize

run linearize

### **Description**

Linearize a model

#### Usage

```
run_linearize(
  model = NULL,
  results = NULL,
  model_name = "linbase",
  description = "",
   ...
)
```

run\_modelfit 163

## **Arguments**

model	(Model (optional)) Pharmpy model.
results	(ModelfitResults (optional)) Results of estimation of model
	, , , , , , , , , , , , , , , , , , , ,
model_name	(str) New name of linearized model. The default is "linbase".
description	(str) Description of linearized model. The default is ""
	Arguments to pass to tool

#### Value

(LinearizeResults) Linearize tool results object.

run\_modelfit run\_modelfit

## Description

Run modelfit tool.

note:: For most use cases the :func:pharmpy.tools.fit function is a more user friendly option for fitting a model.

### Usage

```
run_modelfit(model_or_models = NULL, n = NULL, ...)
```

## **Arguments**

```
model_or_models

(Model or array(Model) (optional)) A vector of models are one single model object

n (numeric (optional)) Number of models to fit. This is only used if the tool is going to be combined with other tools

... Arguments to pass to tool
```

#### Value

(ModelfitResults) Modelfit tool result object

```
## Not run:
model <- load_example_model("pheno")
run_modelfit(model)
## End(Not run)</pre>
```

run\_modelsearch

|--|--|

## Description

Run Modelsearch tool. For more details, see :ref:modelsearch.

# Usage

```
run_modelsearch(
   search_space,
   algorithm = "reduced_stepwise",
   iiv_strategy = "absorption_delay",
   rank_type = "bic",
   cutoff = NULL,
   results = NULL,
   model = NULL,
   strictness = "minimization_successful or (rounding_errors and sigdigs >= 0.1)",
   E = NULL,
   ...
)
```

## Arguments

search_space	(str or ModelFeatures) Search space to test. Either as a string or a ModelFeatures object.
algorithm	(str) Algorithm to use.
iiv_strategy	(str) If/how IIV should be added to candidate models. Default is 'absorption_delay'
rank_type	(str) Which ranking type should be used. Default is BIC.
cutoff	(numeric (optional)) Cutoff for which value of the ranking function that is considered significant. Default is NULL (all models will be ranked)
results	(ModelfitResults (optional)) Results for model
model	(Model (optional)) Pharmpy model
strictness	(str (optional)) Strictness criteria
Е	(numeric or str (optional)) Expected number of predictors (used for mBIC). Must be set when using mBI
	Arguments to pass to tool

### Value

(ModelSearchResults) Modelsearch tool result object

run\_retries 165

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
run_modelsearch('ABSORPTION(ZO);PERIPHERALS(1)', 'exhaustive', results=results, model=model)
## End(Not run)</pre>
```

run\_retries

run\_retries

### **Description**

Run retries tool.

#### Usage

```
run_retries(
  model = NULL,
  results = NULL,
  number_of_candidates = 5,
  fraction = 0.1,
  use_initial_estimates = FALSE,
  strictness = "minimization_successful or (rounding_errors and sigdigs >= 0.1)",
  scale = "UCP",
  prefix_name = "",
  seed = NULL,
  ...
)
```

### **Arguments**

model (Model (optional)) Model object to run retries on. The default is NULL.

results (ModelfitResults (optional)) Connected ModelfitResults object. The default is

NULL.

number\_of\_candidates

(numeric) Number of retry candidates to run. The default is 5.

fraction (numeric) Determines allowed increase/decrease from initial parameter estimate.

Default is 0.1 (10%)

use\_initial\_estimates

(logical) Use initial parameter estimates instead of final estimates of input model

when creating candidate models.

strictness (str (optional)) Strictness criteria. The default is "minimization\_successful or

(rounding\_errors and sigdigs  $\geq 0.1$ )".

run\_ruvsearch

scale (str (optional)) Which scale to update the initial values on. Either normal scale or UCP scale.

prefix\_name (str (optional)) Prefix the candidate model names with given string.

seed (numeric (optional)) Random number generator or seed to be used

... Arguments to pass to tool

#### Value

(RetriesResults) Retries tool results object.

run\_ruvsearch run\_ruvsearch

## Description

Run the ruvsearch tool. For more details, see :ref:ruvsearch.

## Usage

```
run_ruvsearch(
  model = NULL,
  results = NULL,
  groups = 4,
  p_value = 0.001,
  skip = NULL,
  max_iter = 3,
  dv = NULL,
  strictness = "minimization_successful or (rounding_errors and sigdigs>=0.1)",
  ...
)
```

### **Arguments**

model	(Model (optional)) Pharmpy model
results	(ModelfitResults (optional)) Results of model
groups	(numeric) The number of bins to use for the time varying models
p_value	(numeric) The p-value to use for the likelihood ratio test
skip	(array(str) (optional)) A vector of models to not attempt.
max_iter	(numeric) Number of iterations to run $(1, 2, or 3)$ . For models with BLQ only one iteration is supported.
dv	(numeric (optional)) Which DV to assess the error model for.
strictness	(str (optional)) Strictness criteri
	Arguments to pass to tool

run\_simulation 167

### Value

(RUVSearchResults) Ruvsearch tool result object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
run_ruvsearch(model=model, results=results)
## End(Not run)</pre>
```

run\_simulation

run\_simulation

# Description

Run the simulation tool.

### Usage

```
run_simulation(model = NULL, ...)
```

### **Arguments**

```
model (Model (optional)) Pharmpy mode
... Arguments to pass to tool
```

#### Value

(SimulationResult) SimulationResults object

```
## Not run:
model <- load_example_model("pheno")
model <- set_simulation(model, n=10)
run_simulations(model)
## End(Not run)</pre>
```

run\_structsearch

run\_structsearch run\_structsearch

## Description

Run the structsearch tool. For more details, see :ref:structsearch.

## Usage

```
run_structsearch(
  type,
  model,
  results,
  search_space = NULL,
  b_init = NULL,
  emax_init = NULL,
  ec50_init = NULL,
  met_init = NULL,
  extra_model = NULL,
  strictness = "minimization_successful or (rounding_errors and sigdigs >= 0.1)",
  extra_model_results = NULL,
  dv_types = NULL,
  ...
)
```

### **Arguments**

type	(str) Type of model. Currently only 'drug_metabolite' and 'pkpd'
model	(Model) Search space to test
results	(ModelfitResults) Initial estimate for the baseline for pkpd models.
search_space	(str or ModelFeatures (optional)) Initial estimate for $E\_MAX$ (for pkpd models only).
b_init	(numeric (optional)) Initial estimate for EC_50 (for pkpd models only).
emax_init	(numeric (optional)) Initial estimate for MET (for pkpd models only).
ec50_init	(numeric (optional)) Results for the start model
met_init	(numeric (optional)) Pharmpy start model
extra_model	(Model (optional)) Optional extra Pharmpy model to use in TMDD structsearch
strictness	(str (optional)) Results for the extra model
extra_model_results	
	(ModelfitResults (optional)) Strictness criteria
dv_types	(list(str=numeric) (optional)) Dictionary of DV types for TMDD models with multiple DV $$
	Arguments to pass to tool

run\_tool 169

### Value

(StructSearchResult) structsearch tool result object

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
run_structsearch(model_type='pkpd', results=results, model=model)
## End(Not run)</pre>
```

run\_tool

run\_tool

## Description

Run tool workflow

note:: This is a general function that can run any tool. There is also one function for each specific tool. Please refer to the documentation of these for more specific information.

### Usage

```
run_tool(name, ...)
```

## **Arguments**

```
name (str) Name of tool to run
... Arguments to pass to tool
```

### Value

(Results) Results object for tool

```
## Not run:
model <- load_example_model("pheno")
res <- run_tool("ruvsearch", model)
## End(Not run)</pre>
```

```
sample_individual_estimates
sample_individual_estimates
```

### **Description**

Sample individual estimates given their covariance.

### Usage

```
sample_individual_estimates(
  model,
  individual_estimates,
  individual_estimates_covariance,
  parameters = NULL,
  samples_per_id = 100,
  seed = NULL
)
```

## **Arguments**

### Value

(data.frame) Pool of samples in a DataFrame

#### See Also

```
sample_parameters_from_covariance_matrix : Sample parameter vectors using the uncertainty covariance matrix sample_parameters_uniformly : Sample parameter vectors using uniform distribution
```

### **Examples**

### **Description**

Sample parameter vectors using the covariance matrix

If parameters is not provided all estimated parameters will be used

### Usage

```
sample_parameters_from_covariance_matrix(
  model,
  parameter_estimates,
  covariance_matrix,
  force_posdef_samples = NULL,
  force_posdef_covmatrix = FALSE,
  n = 1,
  seed = NULL
)
```

### **Arguments**

### Value

(data.frame) A dataframe with one sample per row

### See Also

```
sample_parameters_uniformly: Sample parameter vectors using uniform distribution sample_individual_estimates: Sample individual estiates given their covariance
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
rng <- create_rng(23)
cov <- results$covariance_matrix
pe <- results$parameter_estimates
sample_parameters_from_covariance_matrix(model, pe, cov, n=3, seed=rng)
## End(Not run)</pre>
```

## Description

Sample parameter vectors using uniform sampling

Each parameter value will be randomly sampled from a uniform distribution with the bounds being estimate ± estimate \* fraction.

## Usage

```
sample_parameters_uniformly(
  model,
  parameter_estimates,
  fraction = 0.1,
  force_posdef_samples = NULL,
  n = 1,
  seed = NULL,
  scale = "normal"
)
```

#### **Arguments**

model (Model) Pharmpy model

parameter\_estimates

(array) Parameter estimates for parameters to use

fraction (numeric) Fraction of estimate value to use for distribution bounds

force\_posdef\_samples

(numeric (optional)) Number of samples to reject before forcing variability pa-

rameters to give positive definite covariance matrices.

n (numeric) Number of samples

seed (numeric (optional)) Random number generator or seed

scale (str) Scale to perform sampling on. Valid options are 'normal' and 'UCP'

#### Value

(data.frame) samples

#### See Also

```
sample_parameters_from_covariance_matrix : Sample parameter vectors using the uncertainty covariance matrix sample_individual_estimates : Sample individual estiates given their covariance
```

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
rng <- create_rng(23)
pe <- results$parameter_estimates
sample_parameters_uniformly(model, pe, n=3, seed=rng)
## End(Not run)</pre>
```

```
set_additive_error_model
```

set\_additive\_error\_model

### Description

Set an additive error model. Initial estimate for new sigma is (equation could not be rendered, see API doc on website)

The error function being applied depends on the data transformation. The table displays some examples.

```
+=======+|(equa-
-----+ | (equation could not be rendered, see API doc on website) +------
```

### Usage

```
set_additive_error_model(model, dv = NULL, data_trans = NULL, series_terms = 2)
```

### **Arguments**

model	(Model) Set error model for this model
dν	(str or Expr or numeric (optional)) Name or DVID of dependent variable. NULL for the default (first or only)
data_trans	(numeric or str or Expr (optional)) A data transformation expression or NULL (default) to use the transformation specified by the model. Series expansion will be used for approximation.
series_terms	(numeric) Number of terms to use for the series expansion approximation for

data transformation.

#### Value

(Model) Pharmpy model object

#### See Also

```
set_proportional_error_model : Proportional error model
set_combined_error_model: Combined error model
```

```
## Not run:
model <- load_example_model("pheno")</pre>
model$statements$find_assignment("Y")
model <- set_additive_error_model(model)</pre>
model$statements$find_assignment("Y")
model <- load_example_model("pheno")</pre>
model$statements$find_assignment("Y")
model <- set_additive_error_model(model, data_trans="log(Y)")</pre>
model$statements$find_assignment("Y")
## End(Not run)
```

set\_baseline\_effect 175

```
set_baseline_effect set_baseline_effect
```

### Description

Create baseline effect model.

Currently implemented baseline effects are:

Constant baseline effect (const):

(equation could not be rendered, see API doc on website)

#### Usage

```
set_baseline_effect(model, expr = "const")
```

### **Arguments**

model (Model) Pharmpy model

expr (str) Name of baseline effect function.

#### Value

(Model) Pharmpy model object

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_baseline_effect(model, expr='const')
model$statements$find_assignment("E")
## End(Not run)</pre>
```

```
set_combined_error_model
```

set\_combined\_error\_model

### **Description**

Set a combined error model. Initial estimates for new sigmas are (equation could not be rendered, see API doc on website) proportional and 0.09 for additive.

The error function being applied depends on the data transformation.

176 set\_covariates

#### Usage

```
set_combined_error_model(model, dv = NULL, data_trans = NULL)
```

### **Arguments**

model (Model) Set error model for this model

dv (str or Expr or numeric (optional)) Name or DVID of dependent variable. NULL

for the default (first or only)

data\_trans (numeric or str or Expr (optional)) A data transformation expression or NULL

(default) to use the transformation specified by the model.

#### Value

(Model) Pharmpy model object

#### See Also

```
set_additive_error_model : Additive error model set_proportional_error_model: Proportional error model
```

## **Examples**

```
## Not run:
model <- remove_error_model(load_example_model("pheno"))
model <- set_combined_error_model(model)
model$statements$find_assignment("Y")
model <- remove_error_model(load_example_model("pheno"))
model <- set_combined_error_model(model, data_trans="log(Y)")
model$statements$find_assignment("Y")

## End(Not run)</pre>
```

set\_covariates

set\_covariates

#### **Description**

Set columns in the dataset to be covariates in the datainfo

#### Usage

```
set_covariates(model, covariates)
```

## Arguments

model (Model) Pharmpy model

covariates (array(str)) List of column names

set\_dataset 177

### Value

(Model) Pharmpy model object

set\_dataset set\_dataset

## Description

Load the dataset given datainfo

# Usage

```
set_dataset(model, path_or_df, datatype = NULL)
```

### **Arguments**

model (Model) Pharmpy model

path\_or\_df (str or data.frame) Dataset path or dataframe

datatype (str (optional)) Type of dataset (optional)

#### Value

(Model) Pharmpy model with new dataset and updated datainfo

```
## Not run:
model <- load_example_model("pheno")
model <- unload_dataset(model)
dataset_path <- model$datainfo$path
model$dataset is NULL
model <- set_dataset(model, dataset_path, datatype='nonmem')
model$dataset
## End(Not run)</pre>
```

set\_direct\_effect

 $set\_description$ 

set\_description

## Description

Set description of model object

## Usage

```
set_description(model, new_description)
```

## Arguments

```
model (Model) Pharmpy model
new_description
(str) New description of model
```

#### Value

(Model) Pharmpy model object

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$description
model <- set_description(model, "PHENOBARB run 2")
model$description
## End(Not run)</pre>
```

 ${\tt set\_direct\_effect}$ 

 $set\_direct\_effect$ 

## **Description**

Add an effect to a model.

Implemented PD models are:

• Linear:

(equation could not be rendered, see API doc on website)

• Emax:

(equation could not be rendered, see API doc on website)

set\_dtbs\_error\_model 179

• Step effect:

(equation could not be rendered, see API doc on website)

• Sigmoidal:

(equation could not be rendered, see API doc on website)

• Log-linear:

```
(equation could not be rendered, see API doc on website)
(equation could not be rendered, see API doc on website)
```

### Usage

```
set_direct_effect(model, expr)
```

### **Arguments**

model (Model) Pharmpy model
expr (str) Name of PD effect function.

### Value

(Model) Pharmpy model object

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_direct_effect(model, "linear")
model$statements$find_assignment("E")
## End(Not run)</pre>
```

```
set_dtbs_error_model set_dtbs_error_model
```

## **Description**

Dynamic transform both sides

## Usage

```
set_dtbs_error_model(model, fix_to_log = FALSE)
```

set\_dvid

## Arguments

model (Model) Pharmpy model

fix\_to\_log (logical) Set to TRUE to fix lambda and zeta to 0, i.e. emulating log-transformed

data

#### Value

(Model) Pharmpy model object

## **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_dtbs_error_model(model)
## End(Not run)</pre>
```

set\_dvid

set\_dvid

## Description

Set a column to act as DVID. Replace DVID if one is already set.

# Usage

```
set_dvid(model, name)
```

## Arguments

model (Model) Pharmpy model
name (str) Name of DVID column

### Value

(Model) Pharmpy model object

set\_estimation\_step 181

```
set_estimation_step
```

# Description

Set estimation step

Sets estimation step for a model. Methods currently supported are: FO, FOCE, ITS, LAPLACE, IMPMAP, IMP, SAEM, BAYES

### Usage

```
set_estimation_step(model, method, idx = 0, ...)
```

# **Arguments**

model (Model) Pharmpy model

method (str) estimation method to change to

idx (numeric) index of estimation step, default is 0 (first estimation step)

... Arguments to pass to EstimationStep (such as interaction, evaluation)

### Value

(Model) Pharmpy model object

#### See Also

```
add_estimation_step
remove_estimation_step
append_estimation_step_options
add_parameter_uncertainty_step
remove_parameter_uncertainty_step
set_evaluation_step
```

```
## Not run:
model <- load_example_model("pheno")
opts <- list('NITER'=1000, 'ISAMPLE'=100)
model <- set_estimation_step(model, 'IMP', evaluation=TRUE, tool_options=opts)
model$execution_steps[1]
## End(Not run)</pre>
```

set\_evaluation\_step

```
set_evaluation_step
```

# Description

Set evaluation step

Change the final or the estimation step with a specific index to do evaulation.

# Usage

```
set_evaluation_step(model, idx = -1)
```

# Arguments

```
model (Model) Pharmpy model
idx (numeric) Index of estimation step, default is -1 (last estimation step)
```

#### Value

```
(Model) Pharmpy model object
```

### See Also

```
set_estimation_step
add_estimation_step
remove_estimation_step
append_estimation_step_options
add_parameter_uncertainty_step
remove_parameter_uncertainty_step
```

```
## Not run:
model <- load_example_model("pheno")
model <- set_evaluation_step(model)
model$execution_steps[1]
## End(Not run)</pre>
```

# Description

Set or change to first order absorption rate.

Initial estimate for absorption rate is set to the previous rate if available, otherwise it is set to the time of first observation/2.

If multiple doses is set to the affected compartment, currently only iv+oral doses (one of each) is supported

# Usage

```
set_first_order_absorption(model)
```

# Arguments

model

(Model) Model to set or change to use first order absorption rate

### Value

```
(Model) Pharmpy model object
```

# See Also

```
set_instantaneous_absorption
set_zero_order_absorption
```

```
## Not run:
model <- load_example_model("pheno")
model <- set_first_order_absorption(model)
model$statements$ode_system
## End(Not run)</pre>
```

set\_iiv\_on\_ruv

```
set\_first\_order\_elimination \\ set\_first\_order\_elimination
```

# Description

Sets elimination to first order

# Usage

```
set_first_order_elimination(model)
```

# Arguments

model

(Model) Pharmpy model

#### Value

(Model) Pharmpy model object

#### See Also

```
set_zero_order_elimination
set_michaelis_menten_elimination
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_first_order_elimination(model)
model$statements$ode_system
## End(Not run)</pre>
```

```
set_iiv_on_ruv
```

set\_iiv\_on\_ruv

# Description

Multiplies epsilons with exponential (new) etas.

Initial variance for new etas is 0.09.

set\_initial\_condition 185

### Usage

```
set_iiv_on_ruv(
  model,
  dv = NULL,
  list_of_eps = NULL,
  same_eta = TRUE,
  eta_names = NULL
)
```

### **Arguments**

model (Model) Pharmpy model to apply IIV on epsilons.

dv (str or Expr or numeric (optional)) Name/names of epsilons to multiply with

exponential etas. If NULL, all epsilons will be chosen. NULL is default.

list\_of\_eps (array(str) or str (optional)) Boolean of whether all RUVs from input should use

the same new ETA or if one ETA should be created for each RUV. TRUE is

default.

same\_eta (logical) Custom names of new etas. Must be equal to the number epsilons or 1

if same eta.

eta\_names (array(str) or str (optional)) Name or DVID of dependent variable. NULL for

the default (first or only)

### Value

(Model) Pharmpy model object

# See Also

```
set_power_on_ruv
```

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_iiv_on_ruv(model)
model$statements$find_assignment("Y")
## End(Not run)</pre>
```

```
set_initial_condition set_initial_condition
```

### **Description**

Set an initial condition for the ode system

If the initial condition is already set it will be updated. If the initial condition is set to zero at time zero it will be removed (since the default is 0).

set\_initial\_estimates

### Usage

```
set_initial_condition(model, compartment, expression, time = 0)
```

# Arguments

model (Model) Pharmpy model

compartment (str) Name of the compartment

expression (numeric or str or Expr) The expression of the initial condition

time (numeric or str or Expr) Time point. Default 0

### Value

(model) Pharmpy model object

### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_initial_condition(model, "CENTRAL", 10)
get_initial_conditions(model)
## End(Not run)</pre>
```

```
set_initial_estimates set_initial_estimates
```

# **Description**

Update initial parameter estimate for a model

Updates initial estimates of population parameters for a model. If the new initial estimates are out of bounds or NaN this function will raise.

# Usage

```
set_initial_estimates(
  model,
  inits,
  move_est_close_to_bounds = FALSE,
  strict = TRUE
)
```

### **Arguments**

model (Model) Pharmpy model to update initial estimates

inits (list(str=numeric)) Initial parameter estimates to update

move\_est\_close\_to\_bounds

(logical) Move estimates that are close to bounds. If correlation >0.99 the correlation will be set to 0.9, if variance is <0.001 the variance will be set to 0.01.

strict (logical) Whether all parameters in input need to exist in the model. Default is

**TRUE** 

#### Value

(Model) Pharmpy model object

### See Also

fix\_parameters\_to: Fixing and setting parameter initial estimates in the same function unfix\_parameters\_to: Unfixing parameters and setting a new initial estimate in the same

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
model$parameters$inits

set\_lloq\_data

set\_lloq\_data

# **Description**

Set a dv value for lloq data records

### Usage

```
set_lloq_data(model, value, lloq = NULL, blq = NULL)
```

# **Arguments**

model (Model) Pharmpy model object

value (str or numeric or Expr) The new dv value

11oq (numeric or str (optional)) Value or column name for lower limit of quantifica-

tion.

blq (str (optional)) Column name for below limit of quantification indicator.

### Value

```
(Model) Pharmpy model object
```

# See Also

```
remove_loq_data
transform_blq
```

set\_lower\_bounds 189

# **Examples**

```

## End(Not run)</pre>
```

set\_lower\_bounds

set\_lower\_bounds

# **Description**

Set parameter lower bounds

# Usage

```
set_lower_bounds(model, bounds, strict = TRUE)
```

# Arguments

model (Model) Pharmpy model

bounds (list(str=numeric)) A list of parameter bounds for parameters to change

strict (logical) Whether all parameters in input need to exist in the model. Default is

**TRUE** 

#### Value

(Model) Pharmpy model object

### See Also

```
set_upper_bounds : Set parameter upper bounds unconstrain_parameters : Remove all constraints of parameters
```

```
## Not run:

model$statements$ode_system
## End(Not run)</pre>
```

set\_ode\_solver

set\_name set\_name

# **Description**

Set name of model object

# Usage

```
set_name(model, new_name)
```

### **Arguments**

model (Model) Pharmpy model new\_name (str) New name of model

### Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$name
model <- set_name(model, "run2")
model$name
## End(Not run)</pre>
```

set\_ode\_solver

set\_ode\_solver

# Description

Sets ODE solver to use for model

Recognized solvers and their corresponding NONMEM advans:

### **Usage**

```
set_ode_solver(model, solver)
```

# **Arguments**

model (Model) Pharmpy model

solver (str) Solver to use or NULL for no preference

### Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_ode_solver(model, 'LSODA')
## End(Not run)</pre>
```

```
set_peripheral_compartments
```

 $set\_peripheral\_compartments$ 

# Description

Sets the number of peripheral compartments for central compartment to a specified number.

If name is set, the peripheral compartment will be added to the compartment with the specified name instead.

# Usage

```
set_peripheral_compartments(model, n, name = NULL)
```

# **Arguments**

model (Model) Pharmpy model

n (numeric) Number of transit compartments

name (str) Name of compartment to add peripheral to.

#### Value

(Model) Pharmpy model object

194 set\_power\_on\_ruv

### See Also

```
add_peripheral_compartment
remove_peripheral_compartment
```

### **Examples**

```
model <- load_example_model("pheno")</pre>
model <- set_peripheral_compartments(model, 2)</pre>
model$statements$ode_system
## End(Not run)
```

set\_power\_on\_ruv

set\_power\_on\_ruv

#### **Description**

Applies a power effect to provided epsilons. If a dependent variable is provided, then only said epsilons affecting said variable will be changed.

Initial estimates for new thetas are 1 if the error model is proportional, otherwise they are 0.1.

NOTE: If no DVs or epsilons are specified, all epsilons with the same name will be connected to the same theta. Running the function per DV will give each epsilon a specific theta.

# Usage

```
set_power_on_ruv(
 model,
 list_of_eps = NULL,
 dv = NULL,
  lower_limit = 0.01,
  ipred = NULL,
  zero_protection = FALSE
)
```

# **Arguments**

model (Model) Pharmpy model to create block effect on. list\_of\_eps (str or array (optional)) Name/names of epsilons to apply power effect. If NULL,

all epsilons will be used. NULL is default.

dν (str or Expr or numeric (optional)) Name or DVID of dependent variable. NULL

will change the epsilon on all occurences regardless of affected dependent vari-

able.

lower\_limit (numeric (optional)) Lower limit of power (theta). NULL for no limit.

#### Value

(Model) Pharmpy model object

### See Also

```
set_iiv_on_ruv
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_power_on_ruv(model)
model$statements$find_assignment("Y")
## End(Not run)</pre>
```

# Description

Set a proportional error model. Initial estimate for new sigma is 0.09.

The error function being applied depends on the data transformation.

### Usage

```
set_proportional_error_model(
  model,
  dv = NULL,
  data_trans = NULL,
  zero_protection = TRUE
)
```

196 set\_reference\_values

# **Arguments**

model (Model) Set error model for this model

dv (str or Expr or numeric (optional)) Name or DVID of dependent variable. NULL

for the default (first or only)

data\_trans (numeric or str or Expr (optional)) A data transformation expression or NULL

(default) to use the transformation specified by the model.

zero\_protection

(logical) Set to TRUE to add code protecting from IPRED=0

#### Value

(Model) Pharmpy model object

#### See Also

```
set_additive_error_model : Additive error model
set_combined_error_model : Combined error model
```

# **Examples**

```
## Not run:
model <- remove_error_model(load_example_model("pheno"))
model <- set_proportional_error_model(model)
model$statements$after_odes
model <- remove_error_model(load_example_model("pheno"))
model <- set_proportional_error_model(
    model,
    data_trans="log(Y)"
model$statements$after_odes
## End(Not run)</pre>
```

```
set_reference_values set_reference_values
```

# Description

Set reference values for selected columns

All values for each selected column will be replaced. For dose columns only the values for dosing events will be replaced.

# Usage

```
set_reference_values(model, refs)
```

### **Arguments**

model (Model) Pharmpy model object

refs (list(str=numeric)) Pairs of column names and reference values

#### Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_reference_values(model, list('WGT'=0.5, 'AMT'=4.0))
model$dataset
## End(Not run)</pre>
```

```
set_seq_zo_fo_absorption
```

set\_seq\_zo\_fo\_absorption

# **Description**

Set or change to sequential zero order first order absorption rate.

Initial estimate for absorption rate is set the previous rate if available, otherwise it is set to the time of first observation/2.

Currently lagtime together with sequential zero order first order absorption is not supported.

# Usage

```
set_seq_zo_fo_absorption(model)
```

### **Arguments**

model

(Model) Model to set or change absorption rate

# Value

(Model) Pharmpy model object

### See Also

```
set_instantaneous_absorption
set_zero_order_absorption
set_first_order_absorption
```

set\_simulation

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_seq_zo_fo_absorption(model)
model$statements$ode_system
## End(Not run)</pre>
```

set\_simulation

set\_simulation

# **Description**

Change model into simulation model

# Usage

```
set\_simulation(model, n = 1, seed = 64206)
```

# **Arguments**

model (Model) Pharmpy model

n (numeric) Number of replicates

seed (numeric) Random seed for the simulation

### Value

(Model) Pharmpy model object

```
## Not run:
model <- load_example_model("pheno")
model <- set_simulation(model, n=10, seed=1234)
steps <- model$execution_steps
steps[1]
## End(Not run)</pre>
```

```
set\_time\_varying\_error\_model \\ set\_time\_varying\_error\_model
```

# **Description**

Set a time varying error model per time cutoff

### Usage

```
set_time_varying_error_model(model, cutoff, idv = "TIME", dv = NULL)
```

### **Arguments**

model	(Model) Pharmpy model
cutoff	(numeric) A cutoff value for idv column
idv	(str) Time or time after dose, default is Time
dv	(str or Expr or numeric (optional)) Name or DVID of dependent variable. NULL
	for the default (first or only)

#### Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_time_varying_error_model(model, cutoff=1.0)
model$statements$find_assignment("Y")
## End(Not run)</pre>
```

set\_tmdd set\_tmdd

# Description

Sets target mediated drug disposition

Implemented target mediated drug disposition (TMDD) models are:

- Full model
- Irreversible binding approximation (IB)
- Constant total receptor approximation (CR)

- Irreversible binding and constant total receptor approximation (CR+IB)
- Quasi steady-state approximation (QSS)
- Wagner
- Michaelis-Menten approximation (MMAPP)

### Usage

```
set_tmdd(model, type, dv_types = NULL)
```

### **Arguments**

model (Model) Pharmpy model type (str) Type of TMDD model

dv\_types (list(str=numeric) (optional)) Dictionary of DV types for TMDD models with

multiple DVs (e.g.  $dv_{types} = list('drug' = 1, 'target' = 2)$ ). Default is NULL which means that all observations are treated as drug observations. For dv = 1 the only allowed keys are 'drug' and 'drug\_tot'. If no DV for drug is specified

then (free) drug will have dv = 1.

#### Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_tmdd(model, "full")
## End(Not run)</pre>
```

```
set_transit_compartments
```

 $set\_transit\_compartments$ 

# Description

Set the number of transit compartments of model.

Initial estimate for absorption rate is set the previous rate if available, otherwise it is set to the time of first observation/2.

# Usage

```
set_transit_compartments(model, n, keep_depot = TRUE)
```

set\_upper\_bounds 201

# **Arguments**

model (Model) Pharmpy model

n (numeric) Number of transit compartments

keep\_depot (logical) FALSE to convert depot compartment into a transit compartment

#### Value

(Model) Pharmpy model object

### See Also

```
add_lag_time
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_transit_compartments(model, 3)
model$statements$ode_system
## End(Not run)</pre>
```

set\_upper\_bounds

set\_upper\_bounds

### **Description**

Set parameter upper bounds

### Usage

```
set_upper_bounds(model, bounds, strict = TRUE)
```

# **Arguments**

model (Model) Pharmpy model

bounds (list(str=numeric)) A list of parameter bounds for parameters to change

strict (logical) Whether all parameters in input need to exist in the model. Default is

TRUE

### Value

(Model) Pharmpy model object

# See Also

set\_lower\_bounds : Set parameter lower bounds

unconstrain\_parameters : Remove all constraints of parameters

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_upper_bounds(model, list('POP_CL'=10))
model$parameters['POP_CL']

## End(Not run)

set_weighted_error_model

set_weighted_error_model</pre>
```

# Description

Encode error model with one epsilon and W as weight

# Usage

```
set_weighted_error_model(model)
```

# **Arguments**

model (Model) Pharmpy model

# Value

(Model) Pharmpy model object

### See Also

```
use\_thetas\_for\_error\_stdev: Use\ thetas\ to\ estimate\ error
```

```
## Not run:
model <- load_example_model("pheno")
model <- set_weighted_error_model(model)
## End(Not run)</pre>
```

```
set_zero_order_absorption
set_zero_order_absorption
```

# Description

Set or change to zero order absorption rate.

Initial estimate for absorption rate is set the previous rate if available, otherwise it is set to the time of first observation/2.

# Usage

```
set_zero_order_absorption(model)
```

# Arguments

model

(Model) Model to set or change to first order absorption rate

#### Value

(Model) Pharmpy model object

### See Also

```
set_instantaneous_absorption
set_first_order_absorption
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_zero_order_absorption(model)
model$statements$ode_system
## End(Not run)</pre>
```

# **Description**

Sets elimination to zero order.

Initial estimate for KM is set to 1% of smallest observation.

204 set\_zero\_order\_input

### Usage

```
set_zero_order_elimination(model)
```

# **Arguments**

model (Model) Pharmpy model

# Value

(Model) Pharmpy model object

### See Also

```
set_first_order_elimination
set_michaelis_menten_elimination
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_zero_order_elimination(model)
model$statements$ode_system
## End(Not run)</pre>
```

```
set_zero_order_input set_zero_order_input
```

# Description

Set a zero order input for the ode system

If the zero order input is already set it will be updated.

# Usage

```
set_zero_order_input(model, compartment, expression)
```

# Arguments

model (Model) Pharmpy model

compartment (str) Name of the compartment

expression (numeric or str or Expr) The expression of the zero order input

# Value

```
(model) Pharmpy model object
```

simplify\_expression 205

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- set_zero_order_input(model, "CENTRAL", 10)
get_zero_order_inputs(model)
## End(Not run)</pre>
```

```
simplify_expression simplify_expression
```

# Description

Simplify expression given constraints in model

# Usage

```
simplify_expression(model, expr)
```

# Arguments

```
model (Model) Pharmpy model object
expr (str or numeric or Expr) Expression to simplify
```

# Value

```
(Expression) Simplified expression
```

```
## Not run:
model <- load_example_model("pheno")
simplify_expression(model, "Abs(POP_CL)")
## End(Not run)</pre>
```

solve\_ode\_system

solve\_ode\_system

### **Description**

Replace ODE system with analytical solution if possible

Warnings This function can currently only handle the most simple of ODE systems.

### Usage

```
solve_ode_system(model)
```

### **Arguments**

model

(Model) Pharmpy model object

### Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$statements$ode_system
model <- solve_ode_system(model)
## End(Not run)</pre>
```

```
split_joint_distribution
```

 $split\_joint\_distribution$ 

### **Description**

Splits etas following a joint distribution into separate distributions.

# Usage

```
split_joint_distribution(model, rvs = NULL)
```

### **Arguments**

model (Model) Pharmpy model

rvs (array(str) or str (optional)) Name/names of etas to separate. If NULL, all etas

that are IIVs and non-fixed will become single. NULL is default.

### Value

(Model) Pharmpy model object

#### See Also

create\_joint\_distribution : combine etas into a join distribution

#### **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- create_joint_distribution(model, c('ETA_CL', 'ETA_VC'))
model$random_variables$etas
model <- split_joint_distribution(model, c('ETA_CL', 'ETA_VC'))
model$random_variables$etas

## End(Not run)</pre>
```

```
summarize_modelfit_results
summarize_modelfit_results
```

# **Description**

Summarize results of model runs

Summarize different results after fitting a model, includes runtime, ofv, and parameter estimates (with errors). If include\_all\_execution\_steps is FALSE, only the last estimation step will be included (note that in that case, the minimization\_successful value will be referring to the last estimation step, if last step is evaluation it will go backwards until it finds an estimation step that wasn't an evaluation).

### Usage

```
summarize_modelfit_results(context, include_all_execution_steps = FALSE)
```

### **Arguments**

```
context (Context) Context in which models were run include_all_execution_steps (logical) Whether to include all estimation steps, default is FALSE
```

### Value

(data.frame) A DataFrame of modelfit results with model name and estmation step as index.

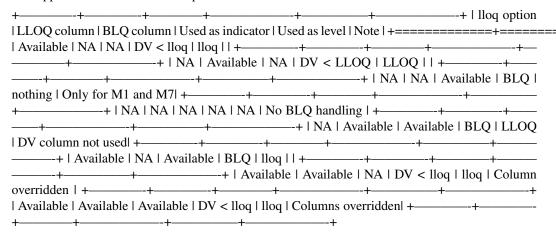

208 transform\_blq

transform\_blq transform\_blq

#### **Description**

Transform for BLQ data

Transform a given model, methods available are m1, m3, m4, m5, m6 and m7 (1). The blq information can come from the dataset, the lloq option or a combination. Both LLOQ and BLQ columns are supported. The table below explains which columns are used for the various cases:

BLQ observations are defined as shown in the table above. If both a BLQ and an LLOQ column exist in the dataset and no lloq is specified then all dv values in rows with BLQ = 1 are counted as BLQ observations. If instead an lloq value is specified then all rows with dv values below the lloq value are counted as BLQ observations. If no lloq is specified and no BLQ column exists in the dataset then all rows with dv values below the value specified in the DV column are counted as BLQ observations.

M1 method: All BLQ observations are discarded. This may affect the size of the dataset. M3 method: Including the probability that the BLQ observations are below the LLOQ as part of the maximum likelihood estimation. For more details see :ref:(1)<ref\_article>. This method modifies the Y statement of the model (see examples below). M4 method: Including the probability that the BLQ observations are below the LLOQ and positive as part of the maximum likelihood estimation. For more details see :ref:(1)<ref\_article>. This method modifies the Y statement of the model (see examples below). M5 method: All BLQ observations are replaced by level/2, where level = lloq if lloq is specified. Else level = value specified in LLOQ column (see table above). This method may change entries in the dataset. M6 method: Every BLQ observation in a consecutive series of BLQ observations is discarded except for the first one. The remaining BLQ observations are replaced by level/2, where level = lloq if lloq is specified. Else level = value specified in LLOQ column (see table above). This method may change entries in the dataset as well as the size of the dataset. M7 method: All BLQ observations are replaced by 0. This method may change entries in the dataset.

Current limitations of the m3 and m4 method:

• Does not support covariance between epsilons

transform\_etas\_boxcox 209

• Supports additive, proportional, combined, and power error model

```

# Examples

```
## Not run:
model <- load_example_model("pheno")
model <- transform_blq(model, method='m4', lloq=0.1)
model$statements$find_assignment("Y")
## End(Not run)</pre>
```

transform\_etas\_boxcox transform\_etas\_boxcox

### **Description**

Applies a boxcox transformation to selected etas Initial estimate for lambda is 0.1 with bounds (-3, 3).

### Usage

```
transform_etas_boxcox(model, list_of_etas = NULL)
```

# **Arguments**

model (Model) Pharmpy model to apply boxcox transformation to.

list\_of\_etas (array(str) or str (optional)) Name/names of etas to transform. If NULL, all etas

will be transformed (default).

#### Value

(Model) Pharmpy model object

#### See Also

```
transform_etas_tdist

model$statements$before_odes$full_expression("CL")
## End(Not run)</pre>
```

transform\_etas\_john\_draper

transform\_etas\_john\_draper

# **Description**

Applies a John Draper transformation (1) to spelected etas

Initial estimate for lambda is 0.1 with bounds (-3, 3).

(1) John, J., Draper, N. (1980). An Alternative Family of Transformations. Journal of the Royal Statistical Society. Series C (Applied Statistics), 29(2), 190-197. doi:10.2307/2986305

### Usage

```
transform_etas_john_draper(model, list_of_etas = NULL)
```

### **Arguments**

model (Model) Pharmpy model to apply John Draper transformation to.

list\_of\_etas (array(str) or str (optional)) Name/names of etas to transform. If NULL, all etas

will be transformed (default).

### Value

(Model) Pharmpy model object

211 transform\_etas\_tdist

### See Also

```
transform_etas_boxcox
transform_etas_tdist
```

# Examples

```
## Not run:
model <- load_example_model("pheno")</pre>
model <- transform_etas_john_draper(model, c("ETA_CL"))</pre>
model$statements$before_odes$full_expression("CL")
## End(Not run)
```

```
transform_etas_tdist transform_etas_tdist
```

### **Description**

Applies a t-distribution transformation to selected etas Initial estimate for degrees of freedom is 80 with bounds (3, 100).

# Usage

```
transform_etas_tdist(model, list_of_etas = NULL)
```

### **Arguments**

model (Model) Pharmpy model to apply t distribution transformation to. list\_of\_etas

(array(str) or str (optional)) Name/names of etas to transform. If NULL, all etas

will be transformed (default).

### Value

```
(Model) Pharmpy model object
```

#### See Also

```

model <- transform_etas_tdist(model, c("ETA_CL"))</pre>
model$statements$before_odes$full_expression("CL")
## End(Not run)
```

translate\_nmtran\_time translate\_nmtran\_time

### **Description**

Translate NM-TRAN TIME and DATE column into one TIME column

If dataset of model have special NM-TRAN TIME and DATE columns these will be translated into one single time column with time in hours.

Warnings Use this function with caution. For example reset events are currently not taken into account.

# Usage

```
translate_nmtran_time(model)
```

# Arguments

model

(Model) Pharmpy model object

# Value

(Model) Pharmpy model object

unconstrain\_parameters

unconstrain\_parameters

# Description

Remove all constraints from parameters

# Usage

```
unconstrain_parameters(model, parameter_names, strict = TRUE)
```

# **Arguments**

model (Model) Pharmpy model

parameter\_names

(array(str)) Remove all constraints for the listed parameters

strict (logical) Whether all parameters in input need to exist in the model. Default is

**TRUE** 

### Value

(Model) Pharmpy model object

undrop\_columns 213

### See Also

```
set_lower_bounds : Set parameter lower bounds set_upper_bounds : Set parameter upper bounds unfix_parameters : Unfix parameters
```

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model$parameters['POP_CL']
model <- unconstrain_parameters(model, c('POP_CL'))
model$parameters['POP_CL']
## End(Not run)</pre>
```

undrop\_columns

undrop\_columns

# **Description**

Undrop columns of model

### Usage

```
undrop_columns(model, column_names)
```

# Arguments

```
model (Model) Pharmpy model object
column_names (array(str) or str) List of column names or one column name to undrop
```

### Value

```
(Model) Pharmpy model object
```

#### See Also

```
drop_dropped_columns : Drop all columns marked as drop
drop_columns : Drop or mark columns as dropped
```

```
## Not run:
model <- load_example_model("pheno")
model <- drop_columns(model, c('WGT', 'APGR'), mark=TRUE)
model <- undrop_columns(model, 'WGT')
## End(Not run)</pre>
```

214 unfix\_parameters

unfix\_parameters

unfix\_parameters

# Description

```
Unfix parameters
Unfix all listed parameters
```

# Usage

```
unfix_parameters(model, parameter_names, strict = TRUE)
```

# Arguments

```
model (Model) Pharmpy model

parameter_names

(array(str) or str) one parameter name or a vector of parameter names

strict (logical) Whether all parameters in input need to exist in the model. Default is
```

**TRUE** 

### Value

(Model) Pharmpy model object

### See Also

```
unfix_paramaters_to: Unfixing parameters and setting a new initial estimate in the same function fix_parameters: Fix parameters fix_or_unfix_parameters: Fix or unfix parameters (given boolean) fix_parameters_to: Fixing and setting parameter initial estimates in the same function unconstrain_parameters: Remove all constraints of parameters
```

```
## Not run:
model <- load_example_model("pheno")
model <- fix_parameters(model, c('POP_CL', 'POP_VC'))
model$parameters$fix
model <- unfix_parameters(model, 'POP_CL')
model$parameters$fix
## End(Not run)</pre>
```

unfix\_parameters\_to 215

```
unfix_parameters_to unfix_parameters_to
```

### **Description**

Unfix parameters to

Unfix all listed parameters to specified value/values

# Usage

```
unfix_parameters_to(model, inits, strict = TRUE)
```

# **Arguments**

model (Model) Pharmpy model

inits (list(str=numeric)) Inits for all parameters to unfix and change init

strict (logical) Whether all parameters in input need to exist in the model. Default is

**TRUE** 

### Value

(Model) Pharmpy model object

#### See Also

```
fix_parameters: Fix parameters
fix_or_unfix_parameters: Fix or unfix parameters (given boolean)
unfix_paramaters: Unfixing parameters
fix_paramaters_to: Fixing parameters and setting a new initial estimate in the same function
```

```
## Not run:
model <- load_example_model("pheno")
model <- fix_parameters(model, c('POP_CL', 'POP_VC'))

model <- unfix_parameters_to(model, list('POP_CL'=0.5))
model$parameters$fix
model$parameters['POP_CL']
## End(Not run)</pre>
```

unload\_dataset

unload\_dataset

# Description

Unload the dataset from a model

# Usage

```
unload_dataset(model)
```

# **Arguments**

model

(Model) Pharmpy model

#### Value

(Model) Pharmpy model with dataset removed

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- unload_dataset(model)
model$dataset is NULL
## End(Not run)</pre>
```

```
update\_initial\_individual\_estimates \\ update\_initial\_individual\_estimates
```

# Description

Update initial individual estimates for a model

Updates initial individual estimates for a model.

# Usage

```
update_initial_individual_estimates(model, individual_estimates, force = TRUE)
```

# **Arguments**

model (Model) Pharmpy model to update initial estimates

individual\_estimates

(array) Individual estimates to use

force (logical) Set to FALSE to only update if the model had initial individual esti-

mates before

#### Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
results <- load_example_modelfit_results("pheno")
ie <- results$individual_estimates
model <- update_initial_individual_estimates(model, ie)
## End(Not run)</pre>
```

```
use_thetas_for_error_stdev 
 use_thetas_for_error_stdev
```

# **Description**

Use thetas to estimate standard deviation of error

# Usage

```
use_thetas_for_error_stdev(model)
```

# **Arguments**

model (Model) Pharmpy model

### Value

(Model) Pharmpy model object

# See Also

set\_weighted\_error\_model: Encode error model with one epsilon and weight

218 write\_model

write_csv	write_	csv
-----------	--------	-----

# Description

Write dataset to a csv file and updates the datainfo path

# Usage

```
write_csv(model, path = NULL, force = FALSE)
```

# **Arguments**

model (Model) Model whose dataset to write to file

path (str (optional)) Destination path. Default is to use original path with .csv suffix.

force (logical) Overwrite file with same path. Default is FALSE.

### Value

(Model) Updated model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
model <- write_csv(model, path="newdataset$csv")
## End(Not run)</pre>
```

write\_model

write\_model

# Description

Write model code to file

# Usage

```
write_model(model, path = "", force = TRUE)
```

# **Arguments**

model	(Model) Pharmpy model
path	(str) Destination path

force (logical) Force overwrite, default is TRUE

write\_results 219

# Value

(Model) Pharmpy model object

# **Examples**

```
## Not run:
model <- load_example_model("pheno")
write_model(model)
## End(Not run)</pre>
```

write\_results

write\_results

# **Description**

Write results object to json (or csv) file

Note that the csv-file cannot be read into a results object again.

# Usage

```
write_results(results, path, compression = FALSE, csv = FALSE)
```

# Arguments

results (Results) Pharmpy results object

path (str) Path to results file

compression (logical) TRUE to compress the file. Not applicable to csv file

csv (logical) Save as csv file
