Package 'GetoptLong'

October 12, 2022

Type Package
Title Parsing Command-Line Arguments and Simple Variable Interpolation
Version 1.0.5
Date 2020-12-15
Author Zuguang Gu
Maintainer Zuguang Gu <z.gu@dkfz.de></z.gu@dkfz.de>
Depends R (>= $3.3.0$)
Imports rjson, GlobalOptions (>= 0.1.0), methods, crayon
Suggests testthat (>= 1.0.0), knitr, markdown, rmarkdown
VignetteBuilder knitr
Description This is a command-line argument parser which wraps the powerful Perl module Getopt::Long and with some adaptations for easier use in R. It also provides a simple way for variable interpolation in R.

2 GetoptLong

Index 10

GetOptions

Wrapper of the Perl module Getopt::Long in R

Description

Wrapper of the Perl module Getopt::Long in R

Usage

```
GetOptions(..., envir = parent.frame())
```

Arguments

... Pass to GetoptLong.

envir User's enrivonment where GetoptLong looks for default values and exports vari-

ables.

Details

This function is the same as GetoptLong. It is just to make it consistent as the GetOptions() subroutine in Getopt::Long module in Perl.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```
# There is no example NULL
```

GetoptLong

Wrapper of the Perl module Getopt: Long in R

Description

Wrapper of the Perl module Getopt::Long in R

Usage

```
GetoptLong(..., help_head = NULL, help_foot = NULL, envir = parent.frame(),
    argv_str = NULL, template_control = list(),
    help_style = GetoptLong.options$help_style)
```

3 GetoptLong

Arguments

Specification of options. The value can be a two-column matrix, a vector with even number of elements or a text template. See the vignette for detailed explahelp_head Head of the help message when invoking Rscript foo.R --help. help_foot Foot of the help message when invoking Rscript foo.R --help. User's enrivonment where GetoptLong looks for default values and exports varienvir A string that contains command-line arguments. It is only for testing purpose. argv_str template_control A list of parameters for controlling when the specification is a template.

help_style The style of the help messages. Value should be either "one-column" or "two-

column".

Details

Following shows a simple example. Put following code at the beginning of your script (e.g. foo.R):

```
library(GetoptLong)
cutoff = 0.05
GetoptLong(
     "number=i", "Number of items.",
"cutoff=f", "Cutoff for filtering results.",
     "verbose", "Print message."
```

Then you can call the script from command line either by:

```
Rscript foo.R --number 4 --cutoff 0.01 --verbose
Rscript foo.R --number 4 --cutoff=0.01 --verbose
Rscript foo.R -n 4 -c 0.01 -v
Rscript foo.R -n 4 --verbose
```

In this example, number is a mandatory option and it should only be in integer mode. cutoff is optional and it already has a default value 0.05. verbose is a logical option. If parsing is successful, two variables number and verbose will be imported into the working environment with the specified values. Value for cutoff will be updated if it is specified in command-line.

For advanced use of this function, please go to the vignette.

# There is no example
NULL
```

4 GetoptLong.options

 $GetoptLong.options \hspace*{0.5cm} \textit{Global options for GetoptLong()} \\$

Description

Global options for GetoptLong()

Usage

```
GetoptLong.options(..., RESET = FALSE, READ.ONLY = NULL, LOCAL = FALSE, ADD = FALSE)
```

Arguments

... Options, see 'Details' section.

RESET Whether to reset options to their default values.

READ.ONLY Whether to only return read-only options.

LOCAL Whether to switch local mode.

ADD Whether to add new options.

Details

Supported global options are following:

```
config \ \ Configuration \ of \ Getopt:: Long, check \ https://perldoc.pl/Getopt:: Long\#Configuring-Getopt:: Long \ .
```

template_tag The tag for identifying specifications in the template. The format should be in left_tag CODE right_tag.

help_style The style of the help message.

GetoptLong.options(...) should be put before calling GetoptLong function.

```
\label{eq:continuous_problem} \mbox{\ensuremath{\mbox{\sc H}}} \mbox{\ensuremath{\mbox{\mbox{\sc H}}}} \mbox{\ensuremath{\mbox{\sc H}}} \mbox{\ensuremath{\mbox{\sc
```

get_scriptdir 5

get_scriptdir

Directory of current script

Description

Directory of current script

Usage

```
get_scriptdir()
```

Value

If the R script is not run from the command-line, it returns NULL.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```
\label{eq:continuous_problem} \mbox{\ensuremath{\mbox{\sc H}}} \mbox{\ensuremath{\mbox{\mbox{\sc H}}}} \mbox{\ensuremath{\mbox{\sc H}}} \mbox{\ensuremath{\mbox{\sc
```

get_scriptname

File name of current script

Description

File name of current script

Usage

```
get_scriptname()
```

Value

If the R script is not run from the command-line, it returns NULL.

qq Simple variable interpolation in texts

Description

Simple variable interpolation in texts

Usage

```
qq(..., envir = parent.frame(), code.pattern = NULL, collapse = TRUE, sep = " ")
```

Arguments

... Text string in which variables are marked with certain rules

envir

Environment where to look for variables. By default it is the environment where
qq is envoked. It can also be a list in which element names are the variable
names to be interpolated.

code.pattern

Pattern of marks for the variables. By default it is @\\{CODE\\} which means
you can write your variable as @{variable}. This value can be a vector that all
patterns are searched.

collapse

If variables return vector of length larger than one, whether collapse into one
string or return a vector

Details

sep

I like variable interpolation in Perl. But in R, if you want to concatenate plain text and variables, you need to use functions such as paste. However, if there are so many variables, quotes, braces in the string you want to construct, it would be painful.

Separator character when there are multiple templates.

This function allows you to construct strings as in Perl style. Variables are marked in the text with certain rule. qq will look up these variables in user's environment and replace the variable marks with their real values.

For more explaination of this function, please refer to vignette.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

```
a = 1
b = "text"
qq("a = @{a}, b = '@{b}'")
qq("a = @{a}", "b = '@{b}'", sep = ", ")
a = 1:2
```

qq.options 7

```
qq("a = @{a}, b = '@{b}'")
qq("a = @{a}, b = '@{b}'", collapse = FALSE)
a = 1
qq("a = `a`, b = '`b`'", code.pattern = "`CODE`")
```

qq.options

Global options for qq() related functions

Description

Global options for qq() related functions

Usage

```
qq.options(..., RESET = FALSE, READ.ONLY = NULL, LOCAL = FALSE, ADD = FALSE)
```

Arguments

	Options, see 'Details' section.
RESET	Whether to reset options to their default values.
READ.ONLY	Whether to only return read-only options.
LOCAL	Whether to switch local mode.
ADD	Whether to add new options.

Details

Supported options are following:

```
cat_prefix prefix of the string which is printed by qqcat
cat_verbose whether to print text by qqcat
cat_strwrap whether call strwrap to wrap the string
code.pattern code pattern for variable interpolation
```

Author(s)

Zuguang Gu <z.gu@dkfz.de>

```
a = 1
qq.options(cat_prefix = "[INFO] ")
qqcat("a = @{a}\n")
qq.options(cat_verbose = FALSE)
qqcat("a = @{a}\n")
qq.options(RESET = TRUE)
qq.options(code.pattern = "`CODE`")
qqcat("a = `a`\n")
qq.options(RESET = TRUE)
```

8 qqcat

ggcat

Print a string which has been intepolated with variables

Description

Print a string which has been intepolated with variables

Usage

```
qqcat(..., envir = parent.frame(), code.pattern = NULL, file = "",
    sep = " ", fill = FALSE, labels = NULL, append = FALSE, cat_prefix = NULL,
    strwrap = qq.options("cat_strwrap"), strwrap_param = list(), sep2 = "")
```

Arguments

```
text string in which variables are marked with certain rules
. . .
                  environment where to look for those variables
envir
                  pattern of marks for the variables
code.pattern
file
                  pass to cat
sep
                  pass to cat
fill
                  pass to cat
labels
                  pass to cat
append
                  pass to cat
cat_prefix
                  prefix string. It is prior than qq.options(cat_prefix).
                  whether call strwrap to wrap the string
strwrap
                  parameters sent to strwrap, must be a list
strwrap_param
                  Separation character when there are multiple templates.
sep2
```

Details

This function is a shortcut of

```
cat(qq(text, envir, code.pattern), ...)
```

Additionally, you can add global prefix:

```
qq.options("cat_prefix" = "[INFO] ")
qq.options("cat_prefix" = function(x) format(Sys.time(), "[%Y-%m-%d %H:%M:%S] "))
qq.options("cat_prefix" = NULL)
```

You can also add local prefix by specifying cat_prefix in qqcat.

```
qqcat(text, cat_prefix = "[INFO] ")
```

Please refer to qq to find more details.

source_script 9

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```
a = 1
b = "text"
qqcat("a = @{a}, b = '@{b}'\n")
qqcat("a = `a`, b = '`b`'\n", code.pattern = "`CODE`")

qq.options("cat_prefix" = function(x) format(Sys.time(), "[%Y-%m-%d %H:%M:%S] "))
qqcat("a = @{a}, b = '@{b}'\n")
Sys.sleep(2)
qqcat("a = @{a}, b = '@{b}'\n")
qq.options(RESET = TRUE)
```

source_script

Source the R script with command-line arguments

Description

Source the R script with command-line arguments

Usage

```
source_script(file, ..., argv_str = NULL)
```

Arguments

```
file The R script
... Pass to source.
argv_str The command-line arguments.
```

```
\# There is no example NULL
```
