## Package 'nominatimlite'

December 17, 2024

```
Version 0.4.2
Description Lite interface for getting data from 'OSM' service
      'Nominatim' <a href="https://nominatim.org/release-docs/latest/">https://nominatim.org/release-docs/latest/</a>. Extract
      coordinates from addresses, find places near a set of coordinates and
      return spatial objects on 'sf' format.

bbox\_to\_poly

Coerce a bounding box to a sfc POLYGON object

## Description

Create a sfc object from the coordinates of a bounding box.

## **Usage**

```
bbox_to_poly(bbox = NA, xmin = NA, ymin = NA, xmax = NA, ymax = NA, crs = 4326)
```

## **Arguments**

bbox Numeric vector of 4 elements representing the coordinates of the bounding box. Values should be c(xmin, ymin, xmax, ymax).

xmin, ymin, xmax, ymax
Alternatively, you can use these named parameters instead of bbox.

crs coordinate reference system, something suitable as input to st\_crs

bbox\_to\_poly 3

## **Details**

Bounding boxes can be located using different online tools, as **Bounding Box Tool**.

## Value

A sfc object of class POLYGON.

## See Also

```

    geom_sf(fill = "lightblue", alpha = 0.5) +
    geom_sf(data = sfobj, fill = "wheat")
}
```

#### **Description**

The lookup API allows to query the address and other details of one or multiple OSM objects like node, way or relation. This function returns the tibble associated with the query, see geo\_address\_lookup\_sf() for retrieving the data as a spatial object (sf format).

## Usage

```
geo_address_lookup(
  osm_ids,
  type = c("N", "W", "R"),
  lat = "lat",
  long = "lon",
  full_results = FALSE,
  return_addresses = TRUE,
  verbose = FALSE,
  nominatim_server = "https://nominatim.openstreetmap.org/",
  custom_query = list()
)
```

#### **Arguments**

Vector of OSM identifiers as **numeric** (c(00000, 11111, 22222)). osm\_ids Vector character of the type of the OSM type associated to each osm\_ids. Postype sible values are node ("N"), way ("W") or relation ("R"). If a single value is provided it would be recycled. Latitude column name in the output data (default "lat"). lat Longitude column name in the output data (default "long"). long full\_results Returns all available data from the API service. If FALSE (default) only latitude, longitude and address columns are returned. See also return\_addresses. return\_addresses Return input addresses with results if TRUE. verbose If TRUE then detailed logs are output to the console. nominatim\_server The URL of the Nominatim server to use. Defaults to "https://nominatim.openstreetmap.org/". A named list with API-specific parameters to be used (i.e. list(countrycodes custom\_query = "US")). See Details.

## Details

See <a href="https://nominatim.org/release-docs/develop/api/Lookup/">https://nominatim.org/release-docs/develop/api/Lookup/</a> for additional parameters to be passed to custom\_query.

```
geo_address_lookup_sf
```

## Value

A tibble with the results found by the query.

## See Also

Address Lookup API: geo_address_lookup_sf()
Geocoding: geo_address_lookup_sf(), geo_amenity(), geo_amenity_sf(), geo_lite_sf(), geo_lite_struct(), geo_lite_struct_sf()
```

## **Examples**

```
ids <- geo_address_lookup(osm_ids = c(46240148, 34633854), type = "W") ids several <- geo_address_lookup(c(146656, 240109189), type = c("R", "N")) several
```

 $\label{lookupAPI} {\it geo\_address\_lookup\_sf} \quad {\it Address\ lookup\ API\ in\ Rhrefhttps://CRAN.R-project.org/package=sf\bf sf} \\ format$ 

## **Description**

The lookup API allows to query the address and other details of one or multiple OSM objects like node, way or relation. This function returns the spatial object associated with the query using **sf**, see geo\_address\_lookup() for retrieving the data in tibble format.

## Usage

```
geo_address_lookup_sf(
   osm_ids,
   type = c("N", "W", "R"),
   full_results = FALSE,
   return_addresses = TRUE,
   verbose = FALSE,
   nominatim_server = "https://nominatim.openstreetmap.org/",
   custom_query = list(),
   points_only = TRUE
)
```

#### **Arguments**

osm\_ids Vector of OSM identifiers as **numeric** (c(00000, 11111, 22222)).

type Vector character of the type of the OSM type associated to each osm\_ids. Pos-

sible values are node ("N"), way ("W") or relation ("R"). If a single value is

provided it would be recycled.

full\_results Returns all available data from the API service. If FALSE (default) only address

columns are returned. See also return\_addresses.

return\_addresses

Return input addresses with results if TRUE.

verbose If TRUE then detailed logs are output to the console.

nominatim\_server

The URL of the Nominatim server to use. Defaults to "https://nominatim.openstreetmap.org/".

custom\_query A named list with API-specific parameters to be used (i.e. list(countrycodes

= "US")). See Details.

points\_only Logical TRUE/FALSE. Whether to return only spatial points (TRUE, which is the

default) or potentially other shapes as provided by the Nominatim API (FALSE).

See About Geometry Types.

#### **Details**

See https://nominatim.org/release-docs/latest/api/Lookup/ for additional parameters to be passed to custom\_query.

#### Value

A sf object with the results.

## **About Geometry Types**

The parameter points\_only specifies whether the function results will be points (all Nominatim results are guaranteed to have at least point geometry) or possibly other spatial objects.

Note that the type of geometry returned in case of points\_only = FALSE will depend on the object being geocoded:

- Administrative areas, major buildings and the like will be returned as polygons.
- Rivers, roads and their like as lines.
- Amenities may be points even in case of a points\_only = FALSE call.

The function is vectorized, allowing for multiple addresses to be geocoded; in case of points\_only = FALSE multiple geometry types may be returned.

reverse_geo_lite_sf()
```

## **Examples**

```
# Notre Dame Cathedral, Paris
NotreDame <- geo_address_lookup_sf(osm_ids = 201611261, type = "W")
# Need at least one non-empty object
if (any(!sf::st_is_empty(NotreDame))) {
  library(ggplot2)
  ggplot(NotreDame) +
    geom_sf()
}
NotreDame_poly <- geo_address_lookup_sf(201611261,</pre>
  type = "W",
  points_only = FALSE
)
if (any(!sf::st_is_empty(NotreDame_poly))) {
  ggplot(NotreDame_poly) +
    geom_sf()
# It is vectorized
several <- geo_address_lookup_sf(c(146656, 240109189), type = c("R", "N"))
several
```

geo\_amenity

Geocode amenities

## Description

This function search amenities as defined by OpenStreetMap on a restricted area defined by a bounding box in the form (<xmin>, <ymin>, <xmax>, <ymax>). This function returns the tibble associated with the query, see geo\_amenity\_sf() for retrieving the data as a spatial object (sf format).

geo\_amenity

#### Usage

```
geo_amenity(
  bbox,
  amenity,
  lat = "lat",
  long = "lon",
  limit = 1,
  full_results = FALSE,
  return_addresses = TRUE,
  verbose = FALSE,
  nominatim_server = "https://nominatim.openstreetmap.org/",
  progressbar = TRUE,
  custom_query = list(),
  strict = FALSE
)
```

## **Arguments**

bbox The bounding box (viewbox) used to limit the search. It could be:

A numeric vector of longitude (x) and latitude (y) (xmin, ymin, xmax, ymax).
 See Details.

• A sf or sfc object.

amenity A character (or a vector of characters) with the amenities to be geolocated

(i.e. c("pub", "restaurant")). See osm\_amenities.

lat Latitude column name in the output data (default "lat").

long Longitude column name in the output data (default "long").

limit Maximum number of results to return per input address. Note that each query

returns a maximum of 50 results.

full\_results Returns all available data from the API service. If FALSE (default) only latitude,

longitude and address columns are returned. See also return\_addresses.

return\_addresses

Return input addresses with results if TRUE.

verbose If TRUE then detailed logs are output to the console.

nominatim\_server

The URL of the Nominatim server to use. Defaults to "https://nominatim.openstreetmap.org/".

progressbar Logical. If TRUE displays a progress bar to indicate the progress of the function.

custom\_query A named list with API-specific parameters to be used (i.e. list(countrycodes

= "US")). See **Details**.

strict Logical TRUE/FALSE. Force the results to be included inside the bbox. Note

that Nominatim default behavior may return results located outside the provided

bounding box.

geo\_amenity 9

## **Details**

Bounding boxes can be located using different online tools, as **Bounding Box Tool**.

For a full list of valid amenities see https://wiki.openstreetmap.org/wiki/Key:amenity and osm\_amenities.

See https://nominatim.org/release-docs/latest/api/Search/ for additional parameters to be passed to custom\_query.

## Value

A tibble with the results found by the query.

#### See Also

```
Other amenity: geo_amenity_sf(), osm_amenities

Geocoding: geo_address_lookup(), geo_address_lookup_sf(), geo_amenity_sf(), geo_lite(), geo_lite_sf(), geo_lite_struct(), geo_lite_struct_sf()
```

```
# Times Square, NY, USA
bbox <- c(
  -73.9894467311, 40.75573629,
  -73.9830630737, 40.75789245
geo_amenity(
 bbox = bbox,
  amenity = "restaurant"
# Several amenities
geo_amenity(
  bbox = bbox,
  amenity = c("restaurant", "pub")
# Increase limit and use with strict
geo_amenity(
 bbox = bbox,
  amenity = c("restaurant", "pub"),
 limit = 10,
  strict = TRUE
)
```

10 geo\_amenity\_sf

## **Description**

This function search amenities as defined by OpenStreetMap on a restricted area defined by a bounding box in the form (<xmin>, <ymin>, <xmax>, <ymax>). This function returns the spatial object associated with the query using sf, see geo\_amenity() for retrieving the data in tibble format.

## Usage

```
geo_amenity_sf(
  bbox,
  amenity,
  limit = 1,
  full_results = FALSE,
  return_addresses = TRUE,
  verbose = FALSE,
  nominatim_server = "https://nominatim.openstreetmap.org/",
  progressbar = TRUE,
  custom_query = list(),
  strict = FALSE,
  points_only = TRUE
)
```

## **Arguments**

bbox The bounding box (viewbox) used to limit the search. It could be:

- A numeric vector of longitude (x) and latitude (y) (xmin, ymin, xmax, ymax).
   See Details.
- A sf or sfc object.

amenity A character (or a vector of characters) with the amenities to be geolocated

(i.e. c("pub", "restaurant")). See osm\_amenities.

limit Maximum number of results to return per input address. Note that each query

returns a maximum of 50 results.

full\_results Returns all available data from the API service. If FALSE (default) only latitude,

longitude and address columns are returned. See also return\_addresses.

return\_addresses

Return input addresses with results if TRUE.

verbose If TRUE then detailed logs are output to the console.

nominatim\_server

The URL of the Nominatim server to use. Defaults to "https://nominatim.openstreetmap.org/".

progressbar Logical. If TRUE displays a progress bar to indicate the progress of the function.

geo\_amenity\_sf 11

custom_query	A named list with API-specific parameters to be used (i.e. list(countrycodes = "US")). See <b>Details</b> .
strict	Logical TRUE/FALSE. Force the results to be included inside the bbox. Note that Nominatim default behavior may return results located outside the provided bounding box.
points_only	Logical TRUE/FALSE. Whether to return only spatial points (TRUE, which is the default) or potentially other shapes as provided by the Nominatim API (FALSE). See <b>About Geometry Types</b> .

## **Details**

Bounding boxes can be located using different online tools, as **Bounding Box Tool**.

For a full list of valid amenities see https://wiki.openstreetmap.org/wiki/Key:amenity and osm\_amenities.

See https://nominatim.org/release-docs/latest/api/Search/ for additional parameters to be passed to custom\_query.

#### Value

A sf object with the results.

## **About Geometry Types**

The parameter points\_only specifies whether the function results will be points (all Nominatim results are guaranteed to have at least point geometry) or possibly other spatial objects.

Note that the type of geometry returned in case of points\_only = FALSE will depend on the object being geocoded:

- Administrative areas, major buildings and the like will be returned as polygons.
- Rivers, roads and their like as lines.
- Amenities may be points even in case of a points\_only = FALSE call.

The function is vectorized, allowing for multiple addresses to be geocoded; in case of points\_only = FALSE multiple geometry types may be returned.

```

12 geo\_lite

## **Examples**

```
# Usera, Madrid
library(ggplot2)
mad <- geo_lite_sf("Usera, Madrid, Spain", points_only = FALSE)

# Restaurants, pubs and schools

rest_pub <- geo_amenity_sf(mad, c("restaurant", "pub", "school"),
    limit = 50
)

if (any(!sf::st_is_empty(rest_pub))) {
    ggplot(mad) +
        geom_sf() +
        geom_sf(data = rest_pub, aes(color = query, shape = query))
}</pre>
```

geo\_lite

Address search API (free-form query)

## **Description**

Geocodes addresses given as character values. This function returns the tibble associated with the query, see geo\_lite\_sf() for retrieving the data as a spatial object (sf format).

This function correspond to the **free-form query** search described in the API endpoint.

## Usage

```
geo_lite(
  address,
  lat = "lat",
  long = "lon",
  limit = 1,
  full_results = FALSE,
  return_addresses = TRUE,
  verbose = FALSE,
  nominatim_server = "https://nominatim.openstreetmap.org/",
  progressbar = TRUE,
  custom_query = list()
)
```

geo\_lite 13

## Arguments

address character with single line address, e.g. ("1600 Pennsylvania Ave NW, Washington") or a vector of addresses (c("Madrid", "Barcelona")). Latitude column name in the output data (default "lat"). lat long Longitude column name in the output data (default "long"). limit Maximum number of results to return per input address. Note that each query returns a maximum of 50 results. full\_results Returns all available data from the API service. If FALSE (default) only latitude, longitude and address columns are returned. See also return\_addresses. return\_addresses Return input addresses with results if TRUE. verbose If TRUE then detailed logs are output to the console. nominatim\_server The URL of the Nominatim server to use. Defaults to "https://nominatim.openstreetmap.org/". Logical. If TRUE displays a progress bar to indicate the progress of the function. progressbar A named list with API-specific parameters to be used (i.e. list(countrycodes custom\_query

#### **Details**

14 geo\_lite\_sf

geo_lite_sf	Address search API in Rhrefhttps://CRAN.R-project.org/package=sfsf format (free-form query)
	format (free form query)

## **Description**

This function allows you to geocode addresses and returns the corresponding spatial object. This function returns the spatial object associated with the query using **sf**, see geo\_lite() for retrieving the data in tibble format.

This function correspond to the **free-form query** search described in the API endpoint.

## Usage

```
geo_lite_sf(
  address,
  limit = 1,
  return_addresses = TRUE,
  full_results = FALSE,
  verbose = FALSE,
  progressbar = TRUE,
  nominatim_server = "https://nominatim.openstreetmap.org/",
  custom_query = list(),
  points_only = TRUE
)
```

## Arguments

address character with single line address, e.g. ("1600 Pennsylvania Ave NW, Washington")

or a vector of addresses (c("Madrid", "Barcelona")).

limit Maximum number of results to return per input address. Note that each query

returns a maximum of 50 results.

return\_addresses

Return input addresses with results if TRUE.

full\_results Returns all available data from the API service. If FALSE (default) only address

columns are returned. See also return\_addresses.

verbose If TRUE then detailed logs are output to the console.

progressbar Logical. If TRUE displays a progress bar to indicate the progress of the function.

nominatim\_server

The URL of the Nominatim server to use. Defaults to "https://nominatim.openstreetmap.org/".

custom\_query A named list with API-specific parameters to be used (i.e. list(countrycodes

= "US")). See **Details**.

points\_only Logical TRUE/FALSE. Whether to return only spatial points (TRUE, which is the

default) or potentially other shapes as provided by the Nominatim API (FALSE).

See About Geometry Types.

geo\_lite\_sf

#### **Details**

See https://nominatim.org/release-docs/latest/api/Search/ for additional parameters to be passed to custom\_query.

#### Value

A sf object with the results.

## **About Geometry Types**

The parameter points\_only specifies whether the function results will be points (all Nominatim results are guaranteed to have at least point geometry) or possibly other spatial objects.

Note that the type of geometry returned in case of points\_only = FALSE will depend on the object being geocoded:

- Administrative areas, major buildings and the like will be returned as polygons.
- Rivers, roads and their like as lines.
- Amenities may be points even in case of a points\_only = FALSE call.

The function is vectorized, allowing for multiple addresses to be geocoded; in case of points\_only = FALSE multiple geometry types may be returned.

```

geo\_lite\_struct

Address search API (structured query)

## **Description**

Geocodes addresses already split into components. This function returns the tibble associated with the query, see geo\_lite\_struct\_sf() for retrieving the data as a spatial object (sf format).

This function correspond to the **structured query** search described in the API endpoint. For performing a free-form search use geo\_lite().

## Usage

```
geo_lite_struct(
  amenity = NULL,
  street = NULL,
  city = NULL,
  county = NULL,
  state = NULL,
  country = NULL,
  postalcode = NULL,
  lat = "lat",
  long = "lon",
  limit = 1,
  full_results = FALSE,
  return_addresses = TRUE,
  verbose = FALSE,
  nominatim_server = "https://nominatim.openstreetmap.org/",
  custom_query = list()
)
```

geo\_lite\_struct 17

## Arguments

amenity Name and/or type of POI, see also geo\_amenity.

street House number and street name.

city City.

county County.

state State.

country Country.

postal code Postal Code.

lat Latitude column name in the output data (default "lat").

long Longitude column name in the output data (default "long").

limit Maximum number of results to return per input address. Note that each query

returns a maximum of 50 results.

full\_results Returns all available data from the API service. If FALSE (default) only latitude,

longitude and address columns are returned. See also return\_addresses.

return\_addresses

Return input addresses with results if TRUE.

verbose If TRUE then detailed logs are output to the console.

nominatim\_server

The URL of the Nominatim server to use. Defaults to "https://nominatim.openstreetmap.org/".

custom\_query A named list with API-specific parameters to be used (i.e. list(countrycodes

= "US")). See **Details**.

## **Details**

The structured form of the search query allows to look up up an address that is already split into its components. Each parameter represents a field of the address. All parameters are optional. You should only use the ones that are relevant for the address you want to geocode.

See https://nominatim.org/release-docs/latest/api/Search/ for additional parameters to be passed to custom\_query.

#### Value

A tibble with the results found by the query.

#### See Also

    street = "Plaza Mayor", country = "Spain",
    limit = 50, full_results = TRUE
)

dplyr::glimpse(pl_mayor)</pre>
```

geo\_lite\_struct\_sf

Address search API in Rhrefhttps://CRAN.R-project.org/package=sfsf format (structured query)

## Description

Geocodes addresses already split into components and return the corresponding spatial object. This function returns the spatial object associated with the query using **sf**, see geo\_lite\_struct() for retrieving the data in tibble format.

This function correspond to the **structured query** search described in the **API** endpoint. For performing a free-form search use geo\_lite\_sf().

## Usage

```
geo_lite_struct_sf(
  amenity = NULL,
  street = NULL,
  city = NULL,
  county = NULL,
  state = NULL,
  country = NULL,
  postalcode = NULL,
  limit = 1,
  full_results = FALSE,
  return_addresses = TRUE,
  verbose = FALSE,
  nominatim_server = "https://nominatim.openstreetmap.org/",
 custom_query = list(),
  points_only = TRUE
)
```

## Arguments

amenity Name and/or type of POI, see also geo\_amenity.

Street House number and street name.

geo\_lite\_struct\_sf

city City.
county County.
state State.
country Country.
postalcode Postal Code.

limit Maximum number of results to return per input address. Note that each query

returns a maximum of 50 results.

full\_results Returns all available data from the API service. If FALSE (default) only latitude,

longitude and address columns are returned. See also return\_addresses.

return\_addresses

Return input addresses with results if TRUE.

verbose If TRUE then detailed logs are output to the console.

nominatim\_server

The URL of the Nominatim server to use. Defaults to "https://nominatim.openstreetmap.org/".

custom\_query A named list with API-specific parameters to be used (i.e. list(countrycodes

= "US")). See Details.

points\_only Logical TRUE/FALSE. Whether to return only spatial points (TRUE, which is the

default) or potentially other shapes as provided by the Nominatim API (FALSE).

See About Geometry Types.

#### **Details**

The structured form of the search query allows to look up up an address that is already split into its components. Each parameter represents a field of the address. All parameters are optional. You should only use the ones that are relevant for the address you want to geocode.

See https://nominatim.org/release-docs/latest/api/Search/ for additional parameters to be passed to custom\_query.

## Value

A sf object with the results.

## **About Geometry Types**

The parameter points\_only specifies whether the function results will be points (all Nominatim results are guaranteed to have at least point geometry) or possibly other spatial objects.

Note that the type of geometry returned in case of points\_only = FALSE will depend on the object being geocoded:

- Administrative areas, major buildings and the like will be returned as polygons.
- Rivers, roads and their like as lines.
- Amenities may be points even in case of a points\_only = FALSE call.

The function is vectorized, allowing for multiple addresses to be geocoded; in case of points\_only = FALSE multiple geometry types may be returned.

```

## **Examples**

```
# Map

pl_mayor <- geo_lite_struct_sf(
    street = "Plaza Mayor",
    county = "Comunidad de Madrid",
    country = "Spain", limit = 50,
    full_results = TRUE, verbose = TRUE
)

# Outline
ccaa <- geo_lite_sf("Comunidad de Madrid, Spain", points_only = FALSE)

library(ggplot2)

if (any(!sf::st_is_empty(pl_mayor), !sf::st_is_empty(ccaa))) {
    ggplot(ccaa) +
        geom_sf() +
        geom_sf(data = pl_mayor, aes(shape = addresstype, color = addresstype))
}</pre>
```

osm\_amenities

OpenStreetMap amenity database

## **Description**

Database with the list of amenities available on OpenStreetMap.

## **Format**

```
A tibble with with 136 rows and fields:

category The category of the amenity.

amenity The value of the amenity.

comment A brief description of the type of amenity.
```

reverse\_geo\_lite 21

#### Note

Data extracted on 03 April 2024.

#### Source

```

## **Examples**

```
data("osm_amenities")
osm_amenities
```

reverse\_geo\_lite

Reverse geocoding API

## Description

Generates an address from a latitude and longitude. Latitudes must be between [-90, 90] and longitudes between [-180, 180]. This function returns the tibble associated with the query, see reverse\_geo\_lite\_sf() for retrieving the data as a spatial object (sf format).

## Usage

```
reverse_geo_lite(
  lat,
  long,
  address = "address",
  full_results = FALSE,
  return_coords = TRUE,
  verbose = FALSE,
  nominatim_server = "https://nominatim.openstreetmap.org/",
  progressbar = TRUE,
  custom_query = list()
)
```

## **Arguments**

lat Latitude values in numeric format. Must be in the range [-90, 90].

long Longitude values in numeric format. Must be in the range [-180, 180].

Address column name in the output data (default "address").

 ${\tt full\_results} \qquad {\tt Returns\ all\ available\ data\ from\ the\ API\ service.\ If\ {\tt FALSE\ (default)\ only\ latitude}},$ 

longitude and address columns are returned. See also return\_addresses.

22 reverse\_geo\_lite

return\_coords Return input coordinates with results if TRUE.

verbose If TRUE then detailed logs are output to the console.

nominatim\_server

The URL of the Nominatim server to use. Defaults to "https://nominatim.openstreetmap.org/".

progressbar Logical. If TRUE displays a progress bar to indicate the progress of the function.

custom\_query API-specific parameters to be used, passed as a named list (ie. list(zoom = 3)).

See Details.

#### **Details**

See https://nominatim.org/release-docs/develop/api/Reverse/ for additional parameters to be passed to custom\_query.

## Value

A tibble with the results found by the query.

## **About Zooming**

Use the option custom\_query = list(zoom = 3) to adjust the output. Some equivalences on terms of zoom:

zoom	address_detail
3	country
5	state
8	county
10	city
14	suburb
16	major streets
17	major and minor streets
18	building

APIRhrefhttps://CRAN.Rreverse\_geo\_lite\_sf Reverse geocoding in project.org/package=sfsf format

## **Description**

Generates an address from a latitude and longitude. Latitudes must be between [-90, 90] and longitudes between [-180, 180]. This function returns the spatial object associated with the query using **sf**, see reverse\_geo\_lite() for retrieving the data in tibble format.

## Usage

```
reverse_geo_lite_sf(
  lat,
  long,
  address = "address",
  full_results = FALSE,
  return_coords = TRUE,
  verbose = FALSE,
  nominatim_server = "https://nominatim.openstreetmap.org/",
  progressbar = TRUE,
  custom_query = list(),
  points_only = TRUE
)
```

#### **Arguments**

lat Latitude values in numeric format. Must be in the range [-90, 90]. long Longitude values in numeric format. Must be in the range [-180, 180]. address Address column name in the output data (default "address"). full\_results Returns all available data from the API service. If FALSE (default) only latitude, longitude and address columns are returned. See also return\_addresses. return\_coords Return input coordinates with results if TRUE. If TRUE then detailed logs are output to the console. verbose
