Package 'amadeus'

October 11, 2024

Title Accessing and Analyzing Large-Scale Environmental Data

Version 1.1.3

Maintainer Kyle Messier < kyle.messier@nih.gov>

Description Functions are designed to facilitate access to and utility with large scale, publicly available environmental data in R. The package contains functions for downloading raw data files from web URLs (download_data()), processing the raw data files into clean spatial objects (process_covariates()), and extracting values from the spatial data objects at point and polygon locations (calc_covariates()). These functions call a series of source-specific functions which are tailored to each data sources/datasets particular URL structure, data format, and spatial/temporal resolution. The functions are tested, versioned, and open source and open access. For calc_sedc() method details, see Messier, Akita, and Serre (2012) <doi:10.1021/es203152a>.

Depends R (>= 4.1.0)

Imports dplyr, sf, sftime, stats, terra, methods, data.table, httr, rvest, exactextractr, utils, stringi, testthat (>= 3.0.0), parallelly, stars, future, future.apply, tidyr, rlang, nhdplusTools, archive, collapse, Rdpack

Suggests covr, withr, knitr, rmarkdown, lwgeom, FNN, doRNG, devtools, stringr, tigris, spelling

RdMacros Rdpack Encoding UTF-8

VignetteBuilder knitr, rmarkdown

RoxygenNote 7.3.2

as_mysftime

Create an sftime object

Description

 $Create\ a\ sftime\ object\ from\ one\ of\ data.\ frame,\ data.\ table,\ sf,\ sftime,\ SpatRaster,\ SpatRasterDataset,\ SpatVector$

Usage

```
as_mysftime(x, ...)
```

Arguments

x an object of class data.frame, data.table, sf, sftime, SpatRaster, SpatRasterDataset

or SpatVector

if x is a data.frame or data.table: lonname, latname, timename and crs arguments are required. If x is a sf or sftime, timename argument is required. If x is a

terra::SpatRaster, varname argument is required.

Value

an sftime object with constrained time column name

Author(s)

Eva Marques

calc_covariates

Calculate covariates wrapper function

Description

The calculate_covariates() function extracts values at point locations from a SpatRaster or SpatVector object returned from process_covariates(). calculate_covariates() and the underlying source-specific covariate functions have been designed to operate on the processed objects. To avoid errors, do not edit the processed SpatRaster or SpatVector objects before passing to calculate_covariates().

calc_covariates 5

Usage

```
calc_covariates(
  covariate = c("modis", "koppen-geiger", "koeppen-geiger", "koeppen", "geos",
    "dummies", "gmted", "sedac_groads", "groads", "roads", "ecoregions", "ecoregion",
    "hms", "smoke", "gmted", "narr", "geos", "sedac_population", "population", "nlcd",
        "merra", "merra2", "gridmet", "terraclimate", "tri", "nei"),
    from,
    locs,
    locs_id = "site_id",
    ...
)
```

Arguments

covariate character(1). Covariate type.

from character. Single or multiple from strings.

locs sf/SpatVector. Unique locations. Should include a unique identifier field named locs_id

locs_id character(1). Name of unique identifier. Default is "site_id".

... Arguments passed to each covariate calculation function.

Value

Calculated covariates as a data.frame or SpatVector object

Note

covariate argument value is converted to lowercase.

calc_covariates(
   covariate = "narr",
   from = narr, # derived from process_covariates() example
   locs = loc,
   locs_id = "id",
   geom = FALSE
)
## End(Not run)</pre>
```

calc_ecoregion

Calculate ecoregions covariates

Description

Extract ecoregions covariates (U.S. EPA Ecoregions Level 2/3) at point locations. Returns a data. frame object containing locs_id and binary (0 = point not in ecoregion; 1 = point in ecoregion) variables for each ecoregion.

Usage

```
calc_ecoregion(from = NULL, locs, locs_id = "site_id", geom = FALSE, ...)
```

Arguments

from	SpatVector(1). Output of process_ecoregion.
locs	sf/SpatVector. Unique locs. Should include a unique identifier field named locs_id
locs_id	character(1). Name of unique identifier.
geom	logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.
	Placeholders.

calc_geos 7

Value

a data.frame or SpatVector object object with dummy variables and attributes of:

```
- attr(., "ecoregion2_code"): Ecoregion lv.2 code and key
```

```
• attr(., "ecoregion3_code"): Ecoregion lv.3 code and key
```

  locs_id = "id",
  geom = FALSE
)
## End(Not run)</pre>
```

calc_geos

Calculate atmospheric composition covariates

Description

Extract atmospheric composition values at point locations. Returns a data. frame object containing locs_id, date and hour, vertical pressure level, and atmospheric composition variable. Atmospheric composition variable column name reflects variable and circular buffer radius.

Usage

```
calc_geos(
  from,
  locs,
  locs_id = NULL,
  radius = 0,
  fun = "mean",
  geom = FALSE,
   ...
)
```

8 calc_geos

Arguments

from	SpatRaster(1). Output of process_geos().
locs	data.frame, characater to file path, SpatVector, or sf object.
locs_id	$character (1). \ Column \ within \ locations \ CSV \ file \ containing \ identifier \ for \ each \ unique \ coordinate \ location.$
radius	integer(1). Circular buffer distance around site locations. (Default = 0).
fun	$character (1). \ Function \ used \ to \ summarize \ multiple \ raster \ cells \ within \ sites \ location \ buffer \ (Default=mean).$
geom	$logical (1). \ Should the function return a SpatVector? \ Default is FALSE. The coordinate reference system of the SpatVector is that of from.$
	Placeholders.

Value

a data.frame or SpatVector object

)
## End(Not run)</pre>
```

calc_gmted 9

-			- 1
ca]	σm	1 + 0	М
Cal	 511	ıcc	ч

Calculate elevation covariates

Description

Extract elevation values at point locations. Returns a data.frame object containing locs_id, year of release, and elevation variable. Elevation variable column name reflects the elevation statistic, spatial resolution of from, and circular buffer radius (ie. Breakline Emphasis at 7.5 arc-second resolution with 0 meter buffer: breakline_emphasis_r75_0).

Usage

```
calc_gmted(
  from,
  locs,
  locs_id = NULL,
  radius = 0,
  fun = "mean",
  geom = FALSE,
   ...
)
```

Arguments

from	SpatRaster(1). Output from process_gmted().
locs	data.frame. character to file path, SpatVector, or sf object.
locs_id	character(1). Column within locations CSV file containing identifier for each unique coordinate location.
radius	integer(1). Circular buffer distance around site locations. (Default = 0).
fun	character(1). Function used to summarize multiple raster cells within sites location buffer (Default = mean).
geom	logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.
	Placeholders

Value

a data.frame or SpatVector object

Author(s)

Mitchell Manware

10 calc_gridmet

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
loc <- data.frame(id = "001", lon = -78.90, lat = 35.97)
calc_gmted(
    from = gmted, # derived from process_gmted() example
    locs = loc,
    locs_id = "id",
    radius = 0,
    fun = "mean",
    geom = FALSE
)
## End(Not run)</pre>
```

calc_gridmet

Calculate gridMET covariates

Description

Extract gridMET values at point locations. Returns a data.frame object containing locs_id and gridMET variable. gridMET variable column name reflects the gridMET variable and circular buffer radius.

Usage

```
calc_gridmet(
  from,
  locs,
  locs_id = NULL,
  radius = 0,
  fun = "mean",
  geom = FALSE,
   ...
)
```

Arguments

from	<pre>SpatRaster(1). Output from process_gridmet().</pre>
locs	data.frame. character to file path, SpatVector, or sf object.
locs_id	$character (1). \ Column \ within \ locations \ CSV \ file \ containing \ identifier \ for \ each \ unique \ coordinate \ location.$
radius	integer(1). Circular buffer distance around site locations. (Default = 0).
fun	character(1). Function used to summarize multiple raster cells within sites location buffer (Default = mean).

calc_hms 11

geom logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.

... Placeholders.

Value

a data.frame or SpatVector object

Author(s)

Mitchell Manware

See Also

```
process_gridmet()
```

Examples

```

    locs_id = "id",
    radius = 0,
    fun = "mean",
    geom = FALSE
)
## End(Not run)</pre>
```

calc_hms

Calculate wildfire smoke covariates

Description

Extract wildfire smoke plume values at point locations. Returns a data.frame object containing locs_id, date, and binary variable for wildfire smoke plume density inherited from from (0 = point not covered by wildfire smoke plume; 1 = point covered by wildfire smoke plume).

Usage

```
calc_hms(from, locs, locs_id = NULL, radius = 0, geom = FALSE, ...)
```

12 calc_koppen_geiger

Arguments

from	SpatVector(1). Output of process_hms().
locs	data.frame, characater to file path, SpatVector, or sf object.
locs_id	character(1). Column within locations CSV file containing identifier for each unique coordinate location.
radius	integer(1). Circular buffer distance around site locations. (Default = 0).
geom	logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.
	Placeholders.

Value

a data.frame or SpatVector object

Author(s)

Mitchell Manware

See Also

```
process_hms()
```

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large

calc_hms(
   from = hms, # derived from process_hms() example
   locs = loc,
   locs_id = "id",
   radius = 0,
   geom = FALSE
)
## End(Not run)</pre>
```

calc_koppen_geiger

Calculate climate classification covariates

Description

Extract climate classification values at point locations. Returns a data.frame object containing locs_id and binary (0 = point not in climate region; 1 = point in climate region) variables for each climate classification region.

calc_koppen_geiger 13

Usage

```
calc_koppen_geiger(
  from = NULL,
  locs = NULL,
  locs_id = "site_id",
  geom = FALSE,
   ...
)
```

Arguments

from SpatVector(1). Output of process_koppen_geiger().

locs sf/SpatVector. Unique locs. Should include a unique identifier field named locs_id

locs_id character(1). Name of unique identifier.

geom logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.

... Placeholders.

Value

a data.frame or SpatVector object

Note

The returned object contains a \$description column to represent the temporal range covered by the dataset. For more information, see https://www.nature.com/articles/sdata2018214.

14 calc_lagged

calc_lagged Calculate temporally lagged covariates	
--	--

Description

The calc_lagged() function calculates daily temporal lagged covariates from the output of calculate_covariates() or calc_*().

Usage

```
calc_lagged(from, date, lag, locs_id, time_id = "time", geom = FALSE)
```

Arguments

from	data.frame(1). A data.frame containing calculated covariates returned from calculate_covariates() or calc $_*$ ().
date	character(2). Start and end dates of desired lagged covariates. Length of 10 each, format YYYY-MM-DD (ex. September 1, 2023 = "2023-09-01").
lag	integer(1). Number of lag days.
locs_id	character(1). Name of unique identifier.
time_id	character(1). Column containing time values.
geom	logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from. To return as a SpatVector, from must also be a SpatVector

Value

```
a data.frame object
```

Note

In order to calculate temporally lagged covariates, from must contain at least the number of lag days before the desired start date. For example, if date = c("2024-01-01", "2024-01-31) and lag = 1, from must contain data starting at 2023-12-31. If from contains geometry features, calc_lagged will return a column with geometry features of the same name. calc_lagged() assumes that all columns other than time_id, locs_id, and fixed columns of "lat" and "lon", follow the genre, variable, lag, buffer radius format adopted in calc_setcolumns().

  lag = 1,
  time_id = "time"
)
## End(Not run)
```

calc_merra2

Calculate meteorological and atmospheric covariates

Description

Extract meteorological and atmospheric values at point locations. Returns a data.frame object containing locs_id, date and hour, vertical pressure level, and meteorological or atmospheric variable. Variable column name reflects variable and circular buffer radius.

Usage

```
calc_merra2(
  from,
  locs,
  locs_id = NULL,
  radius = 0,
  fun = "mean",
  geom = FALSE,
   ...
)
```

Arguments

```
from SpatRaster(1). Output of process_merra2().
locs data.frame, characater to file path, SpatVector, or sf object.
```

    geom = FALSE
)
## End(Not run)</pre>
```

calc_modis_daily

A single-date MODIS worker for parallelization

Description

The function operates at MODIS/VIIRS products on a daily basis. Given that the raw hdf files are downloaded from NASA, standard file names include a data retrieval date flag starting with letter "A". Leveraging that piece of information, the function will select files of scope on the date of interest. Please note that this function does not provide a function to filter swaths or tiles, so it is strongly recommended to check and pre-filter the file names at users' discretion.

calc_modis_daily 17

Usage

```
calc_modis_daily(
  from = NULL,
  locs = NULL,
  locs_id = "site_id",
  radius = 0L,
  date = NULL,
  name_extracted = NULL,
  fun_summary = "mean",
  max_cells = 3e+07,
  geom = FALSE,
  ...
)
```

Arguments

from SpatRaster. Preprocessed objects.

locs SpatVector/sf/sftime object. Locations where MODIS values are summarized.

locs_id character(1). Field name where unique site identifiers are stored. Default is

"site_id"

radius numeric. Radius to generate circular buffers.

date Date(1). date to query.

name_extracted character. Names of calculated covariates.

fun_summary function. Summary function for multilayer rasters. Passed to foo. See exactextractr::exact_extract

for details.

max_cells integer(1). Maximum number of cells to be read at once. Higher values will

expedite processing, but will increase memory usage. Maximum possible value

is 2³¹ - 1.

geom logical(1). Should the function return a SpatVector? Default is FALSE. The co-

ordinate reference system of the SpatVector is that of from. See exactextractr::exact_extract

for details.

... Placeholders.

Value

a data.frame or SpatVector object.

  fun_summary = "mean",
  max_cells = 3e7
)
## End(Not run)
```

calc_modis_par

Calculate MODIS product covariates in multiple CPU threads

Description

calc_modis_par essentially runs calc_modis_daily function in each thread (subprocess). Based on daily resolution, each day's workload will be distributed to each thread. With product argument, the files are processed by a customized function where the unique structure and/or characteristics of the products are considered. nthreads argument should be carefully selected in consideration of the machine's CPU and memory capacities as products have their own memory pressure. locs should be sf object as it is exportable to parallel workers.

Usage

```
calc_modis_par(
   from = NULL,
   locs = NULL,
   locs_id = "site_id",
   radius = c(0L, 1000L, 10000L, 50000L),
   preprocess = process_modis_merge,
   name_covariates = NULL,
   subdataset = NULL,
   fun_summary = "mean",
   nthreads = floor(length(parallelly::availableWorkers())/2),
   package_list_add = NULL,
   export_list_add = NULL,
   max_cells = 3e+07,
   geom = FALSE,
   ...
)
```

calc_modis_par 19

Arguments

from character. List of paths to MODIS/VIIRS files.

locs sf/SpatVector object. Unique locs where covariates will be calculated.

locs_id character(1). Site identifier. Default is "site_id"

radius numeric. Radii to calculate covariates. Default is c(0, 1000, 10000, 50000).

preprocess function. Function to handle HDF files.

name_covariates

character. Name header of covariates. e.g., "MOD_NDVIF_0_". The calculated covariate names will have a form of "{name_covariates}{zero-padded buffer radius in meters}", e.g., 'MOD_NDVIF_0_50000' where 50 km radius in meters}".

dius circular buffer was used to calculate mean NDVI value.

subdataset Indices, names, or search patterns for subdatasets. Find detail usage of the argu-

ment in notes.

fun_summary character or function. Function to summarize extracted raster values.

nthreads integer(1). Number of threads to be used to calculate covariates.

package_list_add

character. A vector with package names to load these in each thread. Note that sf, terra, exact extractr, doParallel, parallelly and dplyr are the

default packages to be loaded.

export_list_add

character. A vector with object names to export to each thread. It should be

minimized to spare memory.

max_cells integer(1). Maximum number of cells to be read at once. Higher values will

expedite processing, but will increase memory usage. Maximum possible value

is 2^31 - 1. See exactextractr::exact_extract for details.

geom logical(1). Should the function return a SpatVector? Default is FALSE. The

coordinate reference system of the SpatVector is that of from.

... Arguments passed to preprocess.

Value

A data.frame or SpatVector with an attribute:

• attr(., "dates_dropped"): Dates with insufficient tiles. Note that the dates mean the dates with insufficient tiles, not the dates without available tiles.

Note

Overall, this function and dependent routines assume that the file system can handle concurrent access to the (network) disk by multiple processes. File system characteristics, package versions, and hardware settings and specification can affect the processing efficiency. locs is expected to be convertible to sf object. sf, SpatVector, and other class objects that could be converted to sf can be used. Common arguments in preprocess functions such as date and path are automatically detected and passed to the function. Please note that locs here and path in preprocess functions are assumed to have a standard naming convention of raw files from NASA. The argument subdataset should be in a proper format depending on preprocess function:

20 calc_modis_par

- process_modis_merge(): Regular expression pattern. e.g., "^LST_"
- process_modis_swath(): Subdataset names. e.g., c("Cloud_Fraction_Day", "Cloud_Fraction_Night")

• process_blackmarble(): Subdataset number. e.g., for VNP46A2 product, 3L. Dates with less than 80 percent of the expected number of tiles, which are determined by the mode of the number of tiles, are removed. Users will be informed of the dates with insufficient tiles. The result data frame will have an attribute with the dates with insufficient tiles.

See Also

See details for setting parallelization:

```
future::plan()future.apply::future_lapply()parallelly::makeClusterPSOCK()parallelly::availableCores()
```

This function leverages the calculation of single-day MODIS covariates:

• calc_modis_daily()

Also, for preprocessing, please refer to:

- process_modis_merge()
- process_modis_swath()
- process_blackmarble()

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
         amount of data which is not included in the package.
locs <- data.frame(lon = -78.8277, lat = 35.95013, id = "001")
locs <- terra::vect(locs, geom = c("lon", "lat"), crs = "EPSG:4326")</pre>
calc_modis_par(
 from =
   list.files("./data", pattern = "VNP46A2.", full.names = TRUE),
 locs = locs.
 locs_id = "site_id",
 radius = c(0L, 1000L),
 preprocess = process_modis_merge,
 name_covariates = "cloud_fraction_0",
 subdataset = "Cloud_Fraction",
 fun_summary = "mean",
 nthreads = 1
)
## End(Not run)
```

calc_narr 21

Calculate meteorological covariates

Description

Extract meteorological values at point locations. Returns a data.frame object containing locs_id, date, vertical pressure level, and meteorological variable. Meteorological variable column name reflects variable and circular buffer radius.

Usage

```
calc_narr(
  from,
  locs,
  locs_id = NULL,
  radius = 0,
  fun = "mean",
  geom = FALSE,
   ...
)
```

Arguments

from	SpatRaster(1). Output of process_narr().
locs	data.frame, characater to file path, SpatVector, or sf object.
locs_id	character(1). Column within locations CSV file containing identifier for each unique coordinate location.
radius	integer(1). Circular buffer distance around site locations. (Default = 0).
fun	character(1). Function used to summarize multiple raster cells within sites location buffer (Default $=$ mean).
geom	logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.
	Placeholders

Value

a data.frame or SpatVector object

  from = narr, # derived from process_narr() example
  locs = loc,
  locs_id = "id",
  radius = 0,
  fun = "mean",
  geom = FALSE
)
## End(Not run)</pre>
```

calc_nei

Calculate road emissions covariates

Description

Calculate road emissions covariates

Usage

```
calc_nei(from = NULL, locs = NULL, locs_id = "site_id", geom = FALSE, ...)
```

Arguments

from	SpatVector(1). Output of process_nei().
locs	sf/SpatVector. Locations at NEI values are joined.
locs_id	character(1). Unique site identifier column name. Unused but kept for compatibility.
geom	logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.
	Placeholders.

Value

a data.frame or SpatVector object

```
process_nei
```

calc_nlcd 23

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
loc <- data.frame(id = "001", lon = -78.90, lat = 35.97)
calc_nei(
    from = nei, # derived from process_nei example
    locs = loc,
    locs_id = "id"
)
## End(Not run)</pre>
```

calc_nlcd

Calculate land cover covariates

Description

Compute ratio of land cover class in circle buffers around points. Returns a data.frame object containing locs_id, longitude, latitude, time (year), and computed ratio for each land cover class.

Usage

```
calc_nlcd(
  from,
  locs,
  locs_id = "site_id",
  mode = c("exact", "terra"),
  radius = 1000,
  max_cells = 5e+07,
  geom = FALSE,
  nthreads = 1L,
   ...
)
```

Arguments

```
SpatRaster(1). Output of process_nlcd().
from
locs
                  terra::SpatVector of points geometry
locs_id
                  character(1). Unique identifier of locations
                  character(1). One of "exact" (using exactextractr::exact_extract()) or
mode
                  "terra" (using terra::freq()).
radius
                  numeric (non-negative) giving the radius of buffer around points
max_cells
                  integer(1). Maximum number of cells to be read at once. Higher values may ex-
                  pedite processing, but will increase memory usage. Maximum possible value is
                  2^31 - 1. Only valid when mode = "exact". See exactextractr::exact_extract
                  for details.
```

24 calc_sedac_groads

geom logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.

nthreads integer(1). Number of threads to be used

Placeholders.

Value

a data.frame or SpatVector object

Note

NLCD is available in U.S. only. Users should be aware of the spatial extent of the data. The results are different depending on mode argument. The "terra" mode is less memory intensive but less accurate because it counts the number of cells intersecting with the buffer. The "exact" may be more accurate but uses more memory as it will account for the partial overlap with the buffer.

See Also

  locs = loc,
  locs_id = "id",
  mode = "exact",
  geom = FALSE
)
## End(Not run)</pre>
```

calc_sedac_groads

Calculate roads covariates

Description

Prepared groads data is clipped with the buffer polygons of radius. The total length of the roads are calculated. Then the density of the roads is calculated by dividing the total length from the area of the buffer. terra::linearUnits() is used to convert the unit of length to meters.

calc_sedac_groads 25

Usage

```
calc_sedac_groads(
  from = NULL,
  locs = NULL,
  locs_id = NULL,
  radius = 1000,
  fun = "sum",
  geom = FALSE,
  ...
)
```

Arguments

from	SpatVector(1). Output of process_sedac_groads.
locs	data.frame, characater to file path, SpatVector, or sf object.
locs_id	character(1). Column within locations CSV file containing identifier for each unique coordinate location.
radius	integer(1). Circular buffer distance around site locations. (Default = 1000).
fun	function (1). Function used to summarize the length of roads within sites location buffer (Default is sum).
geom	logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.
	Placeholders.

Value

a data.frame or SpatVector object

Note

Unit is km/sq km. The returned data. frame object contains a \$time column to represent the temporal range covered by the dataset. For more information, see https://sedac.ciesin.columbia.edu/data/set/groads-global-roads-open-access-v1/metadata.

  geom = FALSE
)

## End(Not run)
```

calc_sedac_population Calculate population density covariates

Description

Extract population density values at point locations. Returns a data.frame object containing locs_id, year, and population density variable. Population density variable column name reflects spatial resolution of from and circular buffer radius.

Usage

```
calc_sedac_population(
  from,
  locs,
  locs_id = NULL,
  radius = 0,
  fun = "mean",
  geom = FALSE,
   ...
)
```

Arguments

from	SpatRaster(1). Output of process_sedac_population().
locs	data.frame, characater to file path, SpatVector, or sf object.
locs_id	$character (1). \ Column \ within \ locations \ CSV \ file \ containing \ identifier \ for \ each \ unique \ coordinate \ location.$
radius	integer(1). Circular buffer distance around site locations. (Default = 0).
fun	$character (1). \ Function \ used \ to \ summarize \ multiple \ raster \ cells \ within \ sites \ location \ buffer \ (Default = mean).$
geom	$logical (1). \ Should the function return a SpatVector? \ Default is FALSE. The coordinate reference system of the SpatVector is that of from.$

)
## End(Not run)</pre>
```

calc_sedc

Calculate Sum of Exponentially Decaying Contributions (SEDC) covariates

Description

Calculate Sum of Exponentially Decaying Contributions (SEDC) covariates

Usage

```
calc_sedc(
  from = NULL,
  locs = NULL,
  locs_id = NULL,
  sedc_bandwidth = NULL,
  target_fields = NULL,
  geom = FALSE
)
```

28 calc_sedc

Arguments

from SpatVector object. Locations where each SEDC is calculated.

locs SpatVector object. Locations where the sum of SEDCs are calculated.

locs_id character(1). Name of the unique id field in point_to.

sedc_bandwidth numeric(1). Distance at which the source concentration is reduced to exp(-3)

(approximately -95 %)

target_fields character(varying). Field names in characters.

geom logical(1). Should the function return a SpatVector? Default is FALSE. The

coordinate reference system of the SpatVector is that of from.

Value

a data.frame (tibble) or SpatVector object with input field names with a suffix "_sedc" where the sums of EDC are stored. Additional attributes are attached for the EDC information.

- 'attr(result, "sedc_bandwidth")": the bandwidth where concentration reduces to approximately five percent
- 'attr(result, "sedc_threshold")": the threshold distance at which emission source points are excluded beyond that

Note

The function is originally from chopin Distance calculation is done with terra functions internally. Thus, the function internally converts sf objects in point_* arguments to terra. The threshold should be carefully chosen by users.

vals <- c("val1", "val2")
calc_sedc(pnt_locs, pnt_from, "NAME", 1e4, vals)</pre>
```

calc_temporal_dummies Calculate temporal dummy covariates

Description

Calculate temporal dummy covariates at point locations. Returns a data. frame object with locs_id, year binary variable for each value in year, and month and day of week binary variables.

Usage

```
calc_temporal_dummies(
  locs,
  locs_id = "site_id",
  year = seq(2018L, 2022L),
  geom = FALSE,
   ...
)
```

Arguments

data.frame with a temporal field named "time"

locs_id character(1). Unique site identifier column name. Default is "site_id".

year integer. Year domain to dummify. Default is seq(2018L, 2022L).

geom logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.

```

calc_terraclimate

Calculate TerraClimate covariates

Description

Extract TerraClimate values at point locations. Returns a data.frame object containing locs_id and TerraClimate variable. TerraClimate variable column name reflects the TerraClimate variable and circular buffer radius.

Usage

```
calc_terraclimate(
  from = NULL,
  locs = NULL,
  locs_id = NULL,
  radius = 0,
  fun = "mean",
  geom = FALSE,
   ...
)
```

Arguments

from	<pre>SpatRaster(1). Output from process_terraclimate().</pre>
locs	data.frame. character to file path, SpatVector, or sf object.
locs_id	character(1). Column within locations CSV file containing identifier for each unique coordinate location.
radius	integer(1). Circular buffer distance around site locations. (Default = 0).
fun	character(1). Function used to summarize multiple raster cells within sites location buffer (Default = mean).
geom	logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.
	Placeholders.

calc_tri 31

Value

a data.frame or SpatVector object

Note

TerraClimate data has monthly temporal resolution, so the \$time column will contain the year and month in YYYYMM format (ie. January, 2018 = 201801).

Author(s)

Mitchell Manware

calc_tri

Calculate toxic release covariates

Description

Extract toxic release values at point locations. Returns a data.frame object containing locs_id and variables for each chemical in from.

Usage

```
calc_tri(
  from = NULL,
  locs,
  locs_id = "site_id",
  radius = c(1000L, 10000L, 50000L),
```

32 calc_tri

```
geom = FALSE,
...
)
```

Arguments

from SpatVector(1). Output of process_tri().

locs sf/SpatVector. Locations where TRI variables are calculated.

locs_id character(1). Unique site identifier column name. Default is "site_id".

radius Circular buffer radius. Default is c(1000, 10000, 50000) (meters)

geom logical(1). Should the function return a SpatVector? Default is FALSE. The coordinate reference system of the SpatVector is that of from.

a data.frame or SpatVector object

Placeholders.

download_aqs 33

download_aqs

Download air quality data

Description

The download_aqs() function accesses and downloads Air Quality System (AQS) data from the U.S. Environmental Protection Agency's (EPA) Pre-Generated Data Files.

Usage

```
download_aqs(
  parameter_code = 88101,
  resolution_temporal = "daily",
  year = c(2018, 2022),
  url_aqs_download = "https://aqs.epa.gov/aqsweb/airdata/",
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  unzip = TRUE,
  remove_zip = FALSE,
  hash = FALSE
```

commands. Default is FALSE.

logical(1). Unzip zip files. Default TRUE.

Arguments

unzip

```
parameter_code integer(1). length of 5. EPA pollutant parameter code. For details, please refer
                  to AQS parameter codes
resolution_temporal
                  character(1). Name of column containing POC values. Currently, no value other
                  than "daily" works.
                  character(1 or 2). length of 4. Year or start/end years for downloading data.
year
url_aqs_download
                  character(1). URL to the AQS pre-generated datasets.
directory_to_save
                  character(1). Directory to save data. Two sub-directories will be created for the
                  downloaded zip files ("/zip_files") and the unzipped data files ("/data_files").
acknowledgement
                  logical(1). By setting TRUE the user acknowledges that the data downloaded us-
                  ing this function may be very large and use lots of machine storage and memory.
download
                  logical(1). FALSE will generate a *.txt file containing all download commands.
                  By setting TRUE the function will download all of the requested data files.
                  logical(1). Remove (TRUE) or keep (FALSE) the text file containing download
remove_command
```

```
remove_zip logical(1). Remove zip file from directory_to_download. Default FALSE.

hash logical(1). By setting TRUE the function will return an rlang::hash_file() hash character corresponding to the downloaded files. Default is FALSE.
```

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- Zip and/or data files will be downloaded and stored in directory_to_save.

Author(s)

Mariana Kassien, Insang Song, Mitchell Manware

References

U.S. Environmental Protection Agency (2023). "Air Quality System Data Mart [internet database]." https://www.epa.gov/outdoor-air-quality-data.

Examples

```
download_aqs(
  parameter_code = 88101,
  resolution_temporal = "daily",
  year = 2023,
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE,
  unzip = FALSE
)
```

download_cropscape

Download CropScape data

Description

Accesses and downloads United States Department of Agriculture CropScape Cropland Data Layer data from the USDA National Agricultural Statistics Service or the George Mason University website.

download_cropscape 35

Usage

```
download_cropscape(
  year = seq(1997, 2023),
  source = c("USDA", "GMU"),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  unzip = TRUE,
  hash = FALSE
)
```

Arguments

year integer(1). Year of the data to download.
source character(1). Data source, one of c("USDA", "GMU").

- "USDA" will download the national data from the USDA website (available in 2008-last year).
- "GMU" will download the data from the George Mason University website (available in 1997-last year).

directory_to_save

character(1). Directory to download files.

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

unzip logical(1). Unzip the downloaded compressed files. Default is FALSE.

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- Yearly comma-separated value (CSV) files will be stored in directory_to_save.

Note

JSON files should be found at STAC catalog of OpenLandMap

36 download_data

Examples

```
download_cropscape(
  year = 2020,
  source = "USDA",
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE,
  unzip = FALSE
)
```

download_data

Download raw data wrapper function

Description

The download_data() function accesses and downloads atmospheric, meteorological, and environmental data from various open-access data sources.

Usage

```
download_data(
  dataset_name = c("aqs", "ecoregion", "ecoregions", "geos", "gmted", "koppen",
  "koppengeiger", "merra2", "merra", "modis", "narr", "nlcd", "noaa", "sedac_groads",
  "sedac_population", "groads", "population", "hms", "smoke", "tri", "nei", "gridmet",
        "terraclimate", "huc", "cropscape", "cdl", "prism"),
    directory_to_save = NULL,
    acknowledgement = FALSE,
    hash = FALSE,
    ...
)
```

Arguments

download_data 37

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.

• Data files will be downloaded and stored in respective sub-directories within directory_to_save. File format and sub-directory names depend on data source and dataset of interest.

Note

• All download function names are in download_* formats

38 download_ecoregion

Examples

```
download_data(
  dataset_name = "narr",
  variables = "weasd",
  year = 2023,
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE
)
```

download_ecoregion

Download ecoregion data

Description

The download_ecoregion() function accesses and downloads United States Ecoregions data from the U.S. Environmental Protection Agency's (EPA) Ecorgions. Level 3 data, where all pieces of information in the higher levels are included, are downloaded.

Usage

```
download_ecoregion(
  epa_certificate_path = system.file("extdata/cacert_gaftp_epa.pem", package = "amadeus"),
  certificate_url =
    "http://cacerts.digicert.com/DigiCertGlobalG2TLSRSASHA2562020CA1-1.crt",
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  unzip = TRUE,
  remove_zip = FALSE,
  hash = FALSE
)
```

Arguments

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download_ecoregion 39

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

unzip logical(1). Unzip zip files. Default TRUE.

remove_zip logical(1). Remove zip file from directory_to_download. Default FALSE.

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

Value

• For hash = FALSE, NULL

- For hash = TRUE, an rlang::hash_file character.
- Zip and/or data files will be downloaded and stored in directory_to_save.

Note

For EPA Data Commons certificate errors, follow the steps below:

- 1. Click Lock icon in the address bar at https://gaftp.epa.gov
- 2. Click Show Certificate
- 3. Access Details
- 4. Find URL with *.crt extension Currently we bundle the pre-downloaded crt and its PEM (which is accepted in wget command) file in ./inst/extdata. The instruction above is for certificate updates in the future.

  remove_command = TRUE,
  unzip = FALSE
)
```

40 download_geos

download_geos

Download atmospheric composition data

Description

The download_geos() function accesses and downloads various atmospheric composition collections from NASA's Global Earth Observing System (GEOS) model.

Usage

```
download_geos(
  collection = c("aqc_tavg_1hr_g1440x721_v1", "chm_tavg_1hr_g1440x721_v1",
    "met_tavg_1hr_g1440x721_x1", "xgc_tavg_1hr_g1440x721_x1",
    "chm_inst_1hr_g1440x721_p23", "met_inst_1hr_g1440x721_p23"),
  date = c("2018-01-01", "2018-01-01"),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  hash = FALSE
)
```

Arguments

collection character(1). GEOS-CF data collection file name.

date character(1 or 2). length of 10. Date or start/end dates for downloading data. Format "YYYY-MM-DD" (ex. January 1, 2018 = "2018-01-01").

directory_to_save character(1). Directory to save data. Sub-directories will be created within directory_to_save for each GEOS-CF collection.

acknowledgement logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

logical(1). FALSE will generate a *.txt file containing all download commands
By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download commands.

logical(1). By setting TRUE the function will return an rlang::hash_file() hash character corresponding to the downloaded files. Default is FALSE.

Value

hash

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- netCDF (.nc4) files will be stored in a collection-specific folder within directory_to_save.

Examples

```
download_geos(
  collection = "aqc_tavg_1hr_g1440x721_v1",
  date = "2024-01-01",
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE
)
```

download_gmted

Download elevation data

Description

The download_gmted() function accesses and downloads Global Multi-resolution Terrain Elevation Data (GMTED2010) from U.S. Geological Survey and National Geospatial-Intelligence Agency.

Usage

```
download_gmted(
   statistic = c("Breakline Emphasis", "Systematic Subsample", "Median Statistic",
      "Minimum Statistic", "Mean Statistic", "Maximum Statistic",
      "Standard Deviation Statistic"),
   resolution = c("7.5 arc-seconds", "15 arc-seconds", "30 arc-seconds"),
   directory_to_save = NULL,
   acknowledgement = FALSE,
   download = FALSE,
   remove_command = FALSE,
   unzip = TRUE,
   remove_zip = FALSE,
   hash = FALSE
)
```

42 download_gmted

Arguments

statistic character(1). Available statistics include "Breakline Emphasis", "Systematic Subsample", "Median Statistic", "Minimum Statistic", "Mean Statistic", "Maximum Statistic", and "Standard Deviation Statistic". resolution character(1). Available resolutions include "7.5 arc-seconds", "15 arc-seconds", and "30 arc-seconds". directory_to_save character(1). Directory to save data. Two sub-directories will be created for the downloaded zip files ("/zip_files") and the unzipped data files ("/data_files"). acknowledgement logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory. download logical(1). FALSE will generate a *.txt file containing all download commands. By setting TRUE the function will download all of the requested data files. logical(1). Remove (TRUE) or keep (FALSE) the text file containing download remove_command commands. Default is FALSE. logical(1). Unzip zip files. Default is TRUE. unzip logical(1). Remove zip file from directory_to_download. Default is FALSE. remove_zip logical(1). By setting TRUE the function will return an rlang::hash_file() hash

hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- Zip and/or data files will be downloaded and stored in directory_to_save.

```
download_gmted(
  statistic = "Breakline Emphasis",
  resolution = "7.5 arc-seconds",
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE,
  unzip = FALSE
)
```

download_gridmet 43

download_gridmet

Download gridMET data

Description

The download_gridmet function accesses and downloads gridded surface meteorological data from the University of California Merced Climatology Lab's gridMET dataset.

Usage

```
download_gridmet(
  variables = NULL,
  year = c(2018, 2022),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  hash = FALSE
```

Arguments

variables character(1). Variable(s) name(s). See gridMET Generate Wget File for variable

names and acronym codes. (Note: variable "Burning Index" has code "bi" and

variable "Energy Release Component" has code "erc").

year character(1 or 2). length of 4. Year or start/end years for downloading data.

directory_to_save

character(1). Directory(s) to save downloaded data files.

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded us-

ing this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- netCDF (.nc) files will be stored in a variable-specific folder within directory_to_save.

44 download_hms

Author(s)

Mitchell Manware

References

Abatzoglou JT (2013). "Development of gridded surface meteorological data for ecological applications and modelling." *International journal of climatology*, **33**(1), 121–131.

Examples

```
download_gridmet(
  variables = "Precipitation",
  year = 2023,
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE
)
```

download_hms

Download wildfire smoke data

Description

The download_hms() function accesses and downloads wildfire smoke plume coverage data from NOAA's Hazard Mapping System Fire and Smoke Product.

Usage

```
download_hms(
  data_format = "Shapefile",
  date = c("2018-01-01", "2018-01-01"),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  unzip = TRUE,
  remove_zip = FALSE,
  hash = FALSE
)
```

Arguments

```
data_format character(1). "Shapefile" or "KML".

date character(1 or 2). length of 10. Date or start/end dates for downloading data.

Format "YYYY-MM-DD" (ex. January 1, 2018 = "2018-01-01").
```

download_hms 45

directory_to_save

character(1). Directory to save data. If data_format = "Shapefile", two sub-directories will be created for the downloaded zip files ("/zip_files") and the unzipped shapefiles ("/data_files"). If data_format = "KML", a single sub-directory ("/data_files") will be created.

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

unzip logical(1). Unzip zip files. Default is TRUE. (Ignored if data_format = "KML".)

remove_zip logical(1). Remove zip files from directory_to_download. Default is FALSE.

(Ignored if data_format = "KML".)

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- Zip and/or data files will be downloaded and stored in respective sub-directories within directory_to_save.

```
download_hms(
  data_format = "Shapefile",
  date = "2024-01-01",
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE,
  unzip = FALSE
)
```

46 download_huc

download_huc

Download National Hydrography Dataset (NHD) data

Description

NHDPlus data provides the most comprehensive and high-resolution hydrography data. This function downloads **national** dataset from NHDPlus Version 2.1 on USGS Amazon S3 storage.

Usage

```
download_huc(
  region = c("Lower48", "Islands"),
  type = c("Seamless", "OceanCatchment"),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  unzip = FALSE,
  hash = FALSE
```

Arguments

character(1). One of c("Lower48", "Islands"). When "Islands" is selected, region the data will be downloaded for Hawaii, Puerto Rico, and Virgin Islands. character(1). One of c("Seamless", "OceanCatchment"). type directory_to_save character(1). Directory to download files. acknowledgement logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory. download logical(1). FALSE will generate a *.txt file containing all download commands. By setting TRUE the function will download all of the requested data files. logical(1). Remove (TRUE) or keep (FALSE) the text file containing download remove_command commands. unzip logical(1). Unzip the downloaded compressed files. Default is FALSE. Not working for this function since HUC data is in 7z format. logical(1). By setting TRUE the function will return an rlang::hash_file() hash hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- Downloaded files will be stored in directory_to_save.

Note

For HUC, set type = "Seamless". HUC12 layer presents in the seamless geodatabase. Users can aggregate HUC12 layer to make HUC6, HUC8, HUC10, etc. For whom wants to download a specific region, please visit Get NHDPlus Data

Author(s)

Insang Song

References

Examples

```
download_huc(
  region = "Lower48",
  type = "Seamless",
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE,
  unzip = FALSE
)
```

download_koppen_geiger

Download climate classification data

Description

The download_koppen_geiger() function accesses and downloads climate classification data from the *Present and future Köppen-Geiger climate classification maps at 1-km resolution*(link for article; link for data).

Usage

```
download_koppen_geiger(
  data_resolution = c("0.0083", "0.083", "0.5"),
  time_period = c("Present", "Future"),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  unzip = TRUE,
  remove_zip = FALSE,
  hash = FALSE
```

Arguments

data_resolution

character(1). Available resolutions are "0.0083" degrees (approx. 1 km), "0.083"

degrees (approx. 10 km), and "0.5" degrees (approx. 50 km).

time_period character(1). Available times are "Present" (1980-2016) and "Future" (2071-

2100). ("Future" classifications are based on scenario RCP8.5).

directory_to_save

character(1). Directory to save data. Two sub-directories will be created for the

downloaded zip files ("/zip_files") and the unzipped shapefiles ("/data_files").

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded us-

ing this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

unzip logical(1). Unzip zip files. Default is TRUE.

remove_zip logical(1). Remove zip files from directory_to_download. Default is FALSE.

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

Value

• For hash = FALSE, NULL

• For hash = TRUE, an rlang::hash_file character.

• Zip and/or data files will be downloaded and stored in respective sub-directories within directory_to_save.

  date = c("2018-01-01", "2018-01-01"),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  hash = FALSE
)
```

Arguments

```
collection character(1). MERRA-2 data collection file name.

date character(1 or 2). length of 10. Date or start/end dates for downloading data. Format "YYYY-MM-DD" (ex. January 1, 2018 = "2018-01-01").

directory_to_save character(1). Directory to save data.

acknowledgement
```

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

50 download_merra2

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE).

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE, the text

file containing download commands.

Value

• For hash = FALSE, NULL

• For hash = TRUE, an rlang::hash_file character.

• netCDF (.nc4) files will be stored in a collection-specific folder within directory_to_save.

Examples

```
download_merra2(
  collection = "inst1_2d_int_Nx",
  date = "2024-01-01",
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE,
)
```

download_modis

Download MODIS product files

Description

Need maintenance for the directory path change in NASA EOSDIS. This function first retrieves the all hdf download links on a certain day, then only selects the relevant tiles from the retrieved links. Download is only done at the queried horizontal-vertical tile number combinations. An exception is MOD06_L2 product, which is produced every five minutes every day.

Usage

```
download_modis(
  product = c("MOD09GA", "MOD11A1", "MOD06_L2", "MCD19A2", "MOD13A2", "VNP46A2"),
  version = "61",
  horizontal_tiles = c(7, 13),
  vertical_tiles = c(3, 6),
  mod06_links = NULL,
  nasa_earth_data_token = NULL,
  date = c("2023-09-01", "2023-09-01"),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  hash = FALSE
```

58 download_modis

Arguments

character(1). One of c("MOD09GA", "MOD11A1", "MOD06_L2", "MCD19A2", "MOD13A2", product "VNP46A2") character(1). Default is "61", meaning v061. version horizontal_tiles integer(2). Horizontal tile numbers $c(\{start\}, \{end\})$. Default is c(7, 13). vertical_tiles integer(2). Vertical tile numbers c({start}, {end}). Default is c(3, 6). mod06_links character(1). CSV file path to MOD06_L2 download links from NASA LAADS MOD06_L2. Default is NULL. nasa_earth_data_token character(1). Token for downloading data from NASA. Should be set before trying running the function. date character(1 or 2). length of 10. Date or start/end dates for downloading data. Format "YYYY-MM-DD" (ex. January 1, 2018 = "2018-01-01"). Note: ignored if product == "MOD06_L2". directory_to_save character(1). Directory to save data. acknowledgement logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory. download logical(1). Download data or only save wget commands. remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download commands. hash logical(1). By setting TRUE the function will return an rlang::hash_file() hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- HDF (.hdf) files will be stored in year/day_of_year sub-directories within directory_to_save.

Note

Both dates in date should be in the same year. Directory structure looks like input/modis/raw/{version}/{product}/{year}/{dates}

## End(Not run)
```

download_narr

Download meteorological data

Description

The download_narr function accesses and downloads daily meteorological data from NOAA's North American Regional Reanalysis (NARR) model.

Usage

```
download_narr(
  variables = NULL,
  year = c(2018, 2022),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  hash = FALSE
)
```

Arguments

download_narr 61

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

Value

• For hash = FALSE, NULL

• For hash = TRUE, an rlang::hash_file character.

• netCDF (.nc) files will be stored in directory_to_save.

Note

"Pressure levels" variables contain variable values at 29 atmospheric levels, ranging from 1000 hPa to 100 hPa. All pressure levels data will be downloaded for each variable.

  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE
)
```

62 download_nei

download_nei

Download road emissions data

Description

The download_nei() function accesses and downloads road emissions data from the U.S Environmental Protection Agency's (EPA) National Emissions Inventory (NEI).

Usage

```
download_nei(
 epa_certificate_path = system.file("extdata/cacert_gaftp_epa.pem", package = "amadeus"),
  certificate_url =
    "http://cacerts.digicert.com/DigiCertGlobalG2TLSRSASHA2562020CA1-1.crt",
  year = c(2017L, 2020L),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  unzip = TRUE,
  hash = FALSE
)
```

Arguments

epa_certificate_path

character(1). Path to the certificate file for EPA DataCommons. Default is 'ext-

data/cacert_gaftp_epa.pem' under the package installation path.

certificate_url

character(1). URL to certificate file. See notes for details.

Available years of NEI data. Default is c(2017L, 2020L). year

directory_to_save

character(1). Directory to save data. Two sub-directories will be created for the downloaded zip files ("/zip_files") and the unzipped data files ("/data_files").

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

logical(1). Remove (TRUE) or keep (FALSE) the text file containing download remove_command

commands.

logical(1). Unzip the downloaded zip files. Default is FALSE. unzip

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

download_nlcd 63

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- Zip and/or data files will be downloaded and stored in respective sub-directories within directory_to_save.

Note

For EPA Data Commons certificate errors, follow the steps below:

- 1. Click Lock icon in the address bar at https://gaftp.epa.gov
- 2. Click Show Certificate
- 3. Access Details
- 4. Find URL with *.crt extension Currently we bundle the pre-downloaded crt and its PEM (which is accepted in wget command) file in ./inst/extdata. The instruction above is for certificate updates in the future.

Examples

```
download_nei(
  year = c(2017L, 2020L),
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE,
  unzip = FALSE
)
```

download_nlcd

Download land cover data

Description

The download_nlcd() function accesses and downloads land cover data from the Multi-Resolution Land Characteristics (MRLC) Consortium's National Land Cover Database (NLCD) products data base.

64 download_nlcd

Usage

```
download_nlcd(
  collection = "Coterminous United States",
  year = 2021,
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  unzip = TRUE,
  remove_zip = FALSE,
  hash = FALSE
)
```

Arguments

collection character(1). "Coterminous United States" or "Alaska".

year integer(1). Available years for Coterminous United States include 2001, 2004,

2006, 2008, 2011, 2013, 2016, 2019, and 2021. Available years for Alaska

include 2001, 2011, and 2016.

directory_to_save

character(1). Directory to save data. Two sub-directories will be created for the

downloaded zip files ("/zip_files") and the unzipped shapefiles ("/data_files").

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded us-

ing this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

unzip logical(1). Unzip zip files. Default is TRUE.

remove_zip logical(1). Remove zip files from directory_to_download. Default is FALSE.

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- Zip and/or data files will be downloaded and stored in respective sub-directories within directory_to_save.

  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE,
  unzip = FALSE
)
```

download_prism

Download PRISM data

Description

Accesses and downloads Oregon State University's PRISM data from the PRISM Climate Group Web Service

Usage

```
download_prism(
   time,
   element = c("ppt", "tmin", "tmax", "tmean", "tdmean", "vpdmin", "vpdmax", "solslope",
        "soltotal", "solclear", "soltrans"),
   data_type = c("ts", "normals_800", "normals"),
   format = c("nc", "asc", "grib2"),
   directory_to_save = NULL,
   acknowledgement = FALSE,
   download = FALSE,
   remove_command = FALSE,
   hash = FALSE
```

Arguments

time

character(1). Length of 2, 4, 6, or 8. Time period for time series or normals. According to the PRISM Web Service Guide, acceptable formats include (disclaimer: the following is a direct quote; minimal formatting is applied): **Time Series**:

• YYYYMMDD for daily data (between yesterday and January 1st, 1981) – returns a single grid in a .zip file

66 download_prism

- YYYYMM for monthly data (between last month and January 1981) returns a single grid in a .zip file
- YYYY for annual data (between last year and 1981) returns a single grid in a .zip file
- YYYY for historical data (between 1980 and 1895) returns a single zip file containing 12 monthly grids for YYYY plus the annual.

Normals:

- Monthly normal: date is MM (i.e., 04 for April) or the value 14, which returns the annual normal
- Daily normal: date is MMDD (i.e., 0430 for April 30)

element

character(1). Data element. One of c("ppt", "tmin", "tmax", "tmean", "tdmean",
"vpdmin", "vpdmax") For normals, c("solslope", "soltotal", "solclear",
"soltrans") are also accepted.

data_type

character(1). Data type.

- "ts": 4km resolution time series.
- "normals 800": 800m resolution normals.
- "normals": 4km resolution normals.

format

character(1). Data format. Only applicable for data_type = "ts".

directory_to_save

character(1). Directory to download files.

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download

logical(1). FALSE will generate a *.txt file containing all download commands. By setting TRUE the function will download all of the requested data files.

remove_command

logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

hash

logical(1). By setting TRUE the function will return an rlang::hash_file() hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- .bil (normals) or single grid files depending on the format choice will be stored in directory_to_save.

  remove_command = TRUE
)
```

download_sedac_groads Download roads data

Description

The download_sedac_groads() function accesses and downloads roads data from NASA's Global Roads Open Access Data Set (gROADS), v1 (1980-2010).

Usage

```
download_sedac_groads(
  data_region = c("Americas", "Global", "Africa", "Asia", "Europe", "Oceania East",
        "Oceania West"),
    data_format = c("Shapefile", "Geodatabase"),
    directory_to_save = NULL,
    acknowledgement = FALSE,
    download = FALSE,
    remove_command = FALSE,
    unzip = TRUE,
    remove_zip = FALSE,
    hash = FALSE
```

Arguments

```
data_region character(1). Data can be downloaded for "Global", "Africa", "Asia", "Europe",
    "Americas", "Oceania East", and "Oceania West".

data_format character(1). Data can be downloaded as "Shapefile" or "Geodatabase".
    (Only "Geodatabase" available for "Global" region).

directory_to_save
    character(1). Directory to save data. Two sub-directories will be created for the
    downloaded zip files ("/zip_files") and the unzipped shapefiles ("/data_files").
```

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

unzip logical(1). Unzip zip files. Default is TRUE.

remove_zip logical(1). Remove zip files from directory_to_download. Default is FALSE.

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

Value

• For hash = FALSE, NULL

• For hash = TRUE, an rlang::hash_file character.

• Zip and/or data files will be downloaded and stored in respective sub-directories within directory_to_save.

download_sedac_population

Download population density data

Description

The download_sedac_population() function accesses and downloads population density data from NASA's UN WPP-Adjusted Population Density, v4.11.

Usage

```
download_sedac_population(
  data_resolution = "60 minute",
  data_format = c("GeoTIFF", "ASCII", "netCDF"),
  year = "2020",
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  unzip = TRUE,
  remove_zip = FALSE,
  hash = FALSE
```

Arguments

data_resolution

character(1). Available resolutions are 30 second (approx. 1 km), 2.5 minute (approx. 5 km), 15 minute (approx. 30 km), 30 minute (approx. 55 km), and 60 minute (approx. 110 km).

data_format

character(1). Individual year data can be downloaded as "ASCII" or "GeoTIFF". "all" years is downloaded as "netCDF".

year

character(1). Available years are 2000, 2005, 2010, 2015, and 2020, or "all" for all years.

directory_to_save

character(1). Directory to save data. Two sub-directories will be created for the downloaded zip files ("/zip_files") and the unzipped shapefiles ("/data_files").

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download

logical(1). FALSE will generate a *.txt file containing all download commands. By setting TRUE the function will download all of the requested data files.

remove_command

logical(1). Remove (TRUE) or keep (FALSE) the text file containing download commands.

unzip

logical(1). Unzip zip files. Default is TRUE.

70 download_terraclimate

```
remove_zip logical(1). Remove zip files from directory_to_download. Default is FALSE.

hash logical(1). By setting TRUE the function will return an rlang::hash_file()
hash character corresponding to the downloaded files. Default is FALSE.
```

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- Zip and/or data files will be downloaded and stored in respective sub-directories within directory_to_save.

Author(s)

Mitchell Manware, Insang Song

References

Center For International Earth Science Information Network-CIESIN-Columbia University (2017). "Gridded Population of the World, Version 4 (GPWv4): Population Density, Revision 11." doi:10.7927/H49C6VHW, https://sedac.ciesin.columbia.edu/data/set/gpw-v4-population-density-rev11.

Examples

```
download_sedac_population(
  data_resolution = "30 second",
  data_format = "GeoTIFF",
  year = "2020",
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE,
  unzip = FALSE
)
```

Description

The download_terraclimate function accesses and downloads climate and water balance data from the University of California Merced Climatology Lab's TerraClimate dataset.

Usage

```
download_terraclimate(
  variables = NULL,
  year = c(2018, 2022),
  directory_to_save = NULL,
  acknowledgement = FALSE,
```

download_terraclimate 71

```
download = FALSE,
  remove_command = FALSE,
  hash = FALSE
)
```

Arguments

variables character(1). Variable(s) name(s). See TerraClimate Direct Downloads for vari-

able names and acronym codes.

year character(1 or 2). length of 4. Year or start/end years for downloading data.

directory_to_save

character(1). Directory(s) to save downloaded data files.

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded us-

ing this function may be very large and use lots of machine storage and memory.

download logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command logical(1). Remove (TRUE) or keep (FALSE) the text file containing download

commands.

hash logical(1). By setting TRUE the function will return an rlang::hash_file()

hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- netCDF (.nc) files will be stored in a variable-specific folder within directory_to_save.

```
download_terraclimate(
  variables = "Precipitation",
  year = 2023,
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE
)
```

72 download_tri

download_tri

Download toxic release data

Description

The download_tri() function accesses and downloads toxic release data from the U.S. Environmental Protection Agency's (EPA) Toxic Release Inventory (TRI) Program.

Usage

```
download_tri(
  year = c(2018L, 2022L),
  directory_to_save = NULL,
  acknowledgement = FALSE,
  download = FALSE,
  remove_command = FALSE,
  hash = FALSE
)
```

Arguments

year character(1 or 2). length of 4. Year or start/end years for downloading data. directory_to_save character(1). Directory to download files.

acknowledgement

logical(1). By setting TRUE the user acknowledges that the data downloaded using this function may be very large and use lots of machine storage and memory.

download

logical(1). FALSE will generate a *.txt file containing all download commands.

By setting TRUE the function will download all of the requested data files.

remove_command log

logical(1). Remove (TRUE) or keep (FALSE) the text file containing download commands.

Command

hash

logical(1). By setting TRUE the function will return an rlang::hash_file() hash character corresponding to the downloaded files. Default is FALSE.

Value

- For hash = FALSE, NULL
- For hash = TRUE, an rlang::hash_file character.
- Comma-separated value (CSV) files will be stored in directory_to_save.

References

United States Environmental Protection Agency (2024). "TRI Basic Data Files: Calendar Years 1987 – Present." https://www.epa.gov/toxics-release-inventory-tri-program/tri-data-action-0.

Examples

```
download_tri(
  year = 2021L,
  directory_to_save = tempdir(),
  acknowledgement = TRUE,
  download = FALSE, # NOTE: download skipped for examples,
  remove_command = TRUE
)
```

dt_as_mysftime

Convert a data.table to an sftime

Description

Convert a data. table object to an sftime. x must be a data. table object with "lon", "lat", and "time" columns to describe the longitude, latitude, and time-orientation, respectively, of x.

Usage

```
dt_as_mysftime(x, lonname, latname, timename, crs)
```

Arguments

x a data.table
lonname character for longitude column name
latname character for latitude column name

timename character for time column name crs coordinate reference system

Value

an sftime object

Author(s)

Eva Marques

74 process_aqs

process_aqs

Process U.S. EPA AQS daily CSV data

Description

The process_aqs() function cleans and imports raw air quality monitoring sites from pre-generated daily CSV files, returning a single SpatVector or sf object. date is used to filter the raw data read from csv files. Filtered rows are then processed according to mode argument. Some sites report multiple measurements per day with and without exceptional events the internal procedure of this function keeps "Included" if there are multiple event types per site-time.

Usage

```
process_aqs(
  path = NULL,
  date = c("2018-01-01", "2022-12-31"),
  mode = c("date-location", "available-data", "location"),
  data_field = "Arithmetic.Mean",
  return_format = c("terra", "sf", "data.table"),
  extent = NULL,
  ...
)
```

Arguments

```
path
                   character(1). Directory path to daily measurement data.
date
                   character(2). Start and end date. Should be in "YYYY-MM-DD" format and sorted.
mode
                  character(1). One of
                     • "date-location" (all dates * all locations)
                     • "available-data" (date-location pairs with available data)
                     • "location" (unique locations).
data_field
                   character(1). Data field to extract.
                  character(1). "terra" or "sf" or "data.table".
return_format
                  numeric(4). Spatial extent of the resulting object. The order should be c(xmin,
extent
                   xmax, ymin, ymax). The coordinate system should be WGS84 (EPSG:4326).
                  Placeholders.
```

Value

a SpatVector, sf, or data.table object depending on the return_format

Note

Choose date and mode values with caution. The function may return a massive data.table depending on the time range, resulting in a long processing time or even a crash if data is too large for your computing environment to process.

   path = "./data/aqs_daily_example.csv",
   date = c("2022-12-01", "2023-01-31"),
   mode = "full",
   return_format = "terra"
)
## End(Not run)</pre>
```

process_blackmarble

Assign VIIRS Black Marble products corner coordinates to retrieve a merged raster

Description

This function will return a SpatRaster object with georeferenced h5 files of Black Marble product. Referencing corner coordinates are necessary as the original h5 data do not include such information.

Usage

```
process_blackmarble(
  path = NULL,
  date = NULL,
  tile_df = process_blackmarble_corners(),
  subdataset = 3L,
  crs = "EPSG:4326",
  ...
)
```

Arguments

```
character. Full paths of h5 files.

date character(1). Date to query.

tile_df data.frame. Contains four corner coordinates in fields named c("xmin", "xmax", "ymin", "ymax"). See process_blackmarble_corners to generate a valid object for this argument.

subdataset integer(1). Subdataset number to process. Default is 3L.
```

```
crs character(1). terra::crs compatible CRS. Default is "EPSG: 4326"
... For internal use.
```

Value

```
a SpatRaster object
```

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
vnp46a2 <- process_blackmarble(
  path =
    list.files("./data", pattern = "VNP46A2.", full.names = TRUE),
  date = "2024-01-01",
  tile_df =
    process_blackmarble_corners(hrange = c(8, 10), vrange = c(4, 5)),
  subdataset = 3L,
    crs = "EPSG:4326"
)
## End(Not run)</pre>
```

process_blackmarble_corners

Process Black Marble corners

Description

Tile corner generator for Black Marble products.

Black Marble products are in HDF5 format and are read without georeference with typical R geospatial packages. This function generates a data.frame of corner coordinates for assignment.

process_covariates 77

Usage

```
process_blackmarble_corners(hrange = c(5, 11), vrange = c(3, 6))
```

Arguments

```
hrange integer(2). Both should be in 0-35. vrange integer(2). Both should be in 0-17.
```

Value

data. frame with xmin, xmax, ymin, and ymax fields

Author(s)

Insang Song

References

• Wang, Z. (2022). Black Marble User Guide (Version 1.3). NASA.

Examples

```
process_blackmarble_corners(hrange = c(1, 2), vrange = c(1, 2))
```

process_covariates

Process raw data wrapper function

Description

This function processes raw data files which have been downloaded by download_data. process_covariates and the underlying source-specific processing functions have been designed to operate on the raw data files. To avoid errors, **do not edit the raw data files before passing to** process_covariates.

```
process_covariates(
  covariate = c("modis_swath", "modis_merge", "koppen-geiger", "blackmarble",
    "koeppen-geiger", "koppen", "geos", "dummies", "gmted", "hms", "smoke",
    "sedac_population", "population", "sedac_groads", "groads", "roads", "nlcd", "tri",
        "narr", "nei", "ecoregions", "ecoregion", "merra", "merra2", "gridmet",
        "terraclimate", "huc", "cropscape", "cdl", "prism"),
    path = NULL,
    ...
)
```

78 process_covariates

Arguments

```
covariate character(1). Covariate type.

path character(1). Directory or file path to raw data depending on covariate value.

Arguments passed to each raw data processing function.
```

Value

SpatVector, SpatRaster, sf, or character depending on covariate type and selections.

```

process_cropscape

Process CropScape data

Description

This function imports and cleans raw CropScape data, returning a single SpatRaster object.

Reads CropScape file of selected year.

Usage

```
process_cropscape(path = NULL, year = 2021, extent = NULL, ...)
```

Arguments

path character giving CropScape data path

year numeric giving the year of CropScape data used

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the

entire raster is loaded

... Placeholders.

Value

a SpatRaster object

Author(s)

Insang Song

80 process_ecoregion

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
cropscape <- process_cropscape(
   path = "./data/cropscape_example.tif",
   year = 2020
)
## End(Not run)</pre>
```

process_ecoregion

Process ecoregion data

Description

The process_ecoregion function imports and cleans raw ecoregion data, returning a SpatVector object.

Usage

```
process_ecoregion(path = NULL, extent = NULL, ...)
```

Placeholders.

Arguments

path character(1). Path to Ecoregion Shapefiles

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the entire raster is loaded

Value

```
a SpatVector object
```

Note

The function will fix Tukey's bridge in Portland, ME. This fix will ensure that the EPA air quality monitoring sites will be located within the ecoregion.

Author(s)

Insang Song

process_flatten_sds 81

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
ecoregion <- process_ecoregion(
   path = "./data/epa_ecoregion.gpkg"
)
## End(Not run)</pre>
```

Description

Aggregate layers in a sub-dataset in sinusoidal MODIS products.

Some MODIS products consist of multi-layer subdatasets. This function aggregates multiple layers into single layer SpatRaster. fun_agg is applied at overlapping cells.

Usage

```
process_flatten_sds(path = NULL, subdataset = NULL, fun_agg = "mean", ...)
```

Arguments

path	character(1). Full path to MODIS HDF4/HDF5 file. Direct sub-dataset access is supported, for example, HDF4_EOS:EOS_GRID:{filename}:{base_grid_information}:{sub-dataset}
subdataset	character(1). Exact or regular expression filter of sub-dataset. See process_modis_sds for details.
fun_agg	character(1). Function name to aggregate layers. Should be acceptable to terra::tapp.
	Placeholders.

Value

a SpatRaster object

Note

HDF values are read as original without scaling. Users should consult MODIS product documentation to apply proper scaling factor for post-hoc adjustment. If users have no preliminary information about MODIS sub-datasets, consider running terra::describe(__filename__, sds = TRUE) to navigate the full list of sub-datasets in the input file then consult the documentation of MODIS product.

82 process_geos

Author(s)

Insang Song

See Also

terra::tapp, terra::rast, terra::describe

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
mod09ga_flatten <- process_flatten_sds(
   path =
        list.files("./data", pattern = "MOD09GA.", full.names = TRUE)[1],
        subdataset = process_modis_sds("MOD09GA"),
        fun_agg = "mean"
)
## End(Not run)</pre>
```

process_geos

Process atmospheric composition data

Description

The process_geos() function imports and cleans raw atmospheric composition data, returning a single SpatRaster object.

Usage

```
process_geos(
  date = c("2018-01-01", "2018-01-01"),
  variable = NULL,
  path = NULL,
  extent = NULL,
  ...
)
```

Arguments

```
date character(2). length of 10. Format "YYYY-MM-DD".

variable character(1). GEOS-CF variable name(s).

path character(1). Directory with downloaded netCDF (.nc4) files.

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the entire raster is loaded

Placeholders.
```

process_gmted 83

Value

```
a SpatRaster object;
```

Note

Layer names of the returned SpatRaster object contain the variable, pressure level, date, and hour.

Author(s)

Mitchell Manware

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
geos <- process_geos(
   date = c("2024-01-01", "2024-01-10"),
   variable = "03",
   path = "./data/aqc_tavg_1hr_g1440x721_v1"
)
## End(Not run)</pre>
```

process_gmted

Process elevation data

Description

The process_gmted() function imports and cleans raw elevation data, returning a single SpatRaster object.

Usage

```
process_gmted(variable = NULL, path = NULL, extent = NULL, ...)
```

Arguments

variable

vector(1). Vector containing the GMTED statistic first and the resolution second. (Example: variable = c("Breakline Emphasis", "7.5 arc-seconds")).

- Statistic options: "Breakline Emphasis", "Systematic Subsample", "Median Statistic", "Minimum Statistic", "Mean Statistic", "Maximum Statistic", "Standard Deviation Statistic"
- Resolution options: "30 arc-seconds", "15 arc-seconds", "7.5 arc-seconds"

path

character(1). Directory with downloaded GMTED "*_grd" folder containing .adf files.

extent

numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the

entire raster is loaded

... Placeholders.

84 process_gridmet

Value

```
a SpatRaster object
```

Note

SpatRaster layer name indicates selected variable and resolution, and year of release (2010).

Author(s)

Mitchell Manware

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
gmted <- process_gmted(
  variable = c("Breakline Emphasis", "7.5 arc-seconds"),
  path = "./data/be75_grd"
)
## End(Not run)</pre>
```

process_gridmet

Process gridMET data

Description

The process_gridmet() function imports and cleans raw gridded surface meteorological data, returning a single SpatRaster object.

Usage

```
process_gridmet(
  date = c("2023-09-01", "2023-09-01"),
  variable = NULL,
  path = NULL,
  extent = NULL,
  ...
)
```

Arguments

character(2). length of 10 each. Start/end date of downloaded data. Format YYYY-MM-DD (ex. September 1, 2023 = "2023-09-01").

variable character(1). Variable name or acronym code. See gridMET Generate Wget File for variable names and acronym codes. (Note: variable "Burning Index" has code "bi" and variable "Energy Release Component" has code "erc").

process_hms 85

```
path character(1). Directory with downloaded netCDF (.nc) files.

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the entire raster is loaded

... Placeholders.
```

Value

```
a SpatRaster object
```

Note

Layer names of the returned SpatRaster object contain the variable acronym, and date.

Author(s)

Mitchell Manware

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
gridmet <- process_gridmet(
   date = c("2023-01-01", "2023-01-10"),
   variable = "Precipitation",
   path = "./data/pr"
)
## End(Not run)</pre>
```

process_hms

Process wildfire smoke data

Description

The process_hms() function imports and cleans raw wildfire smoke plume coverage data, returning a single SpatVector object.

```
process_hms(
  date = c("2018-01-01", "2018-01-01"),
  path = NULL,
  extent = NULL,
  ...
)
```

86 process_huc

Arguments

date	character(2). length of 10 each. Start/end date of downloaded data. Format YYYY-MM-DD (ex. September 1, 2023 = "2023-09-01").	
path	character(1). Directory with downloaded NOAA HMS data files.	
extent	numeric(4) or SpatExtent giving the extent of the output if NULL (default), the entire data is returned	
	Placeholders.	

Value

a SpatVector or character object

Note

process_hms() will return a character object if there are no wildfire smoke plumes present for the selected dates and density. The returned character will contain the density value and the sequence of dates for which no wildfire smoke plumes were detected (see "Examples"). If multiple density polygons overlap, the function will return the highest density value.

Author(s)

Mitchell Manware

Examples

```
hms <- process_hms(
  date = c("2018-12-30", "2019-01-01"),
  path = "../tests/testdata/hms/"
)</pre>
```

process_huc

Retrieve Hydrologic Unit Code (HUC) data

Description

Retrieve Hydrologic Unit Code (HUC) data

```
process_huc(
  path,
  layer_name = NULL,
  huc_level = NULL,
  huc_header = NULL,
  extent = NULL,
  ...
)
```

process_huc 87

Arguments

path character. Path to the file or the directory containing HUC data.

layer_name character(1). Layer name in the path

huc_level character(1). Field name of HUC level

huc_header character(1). The upper level HUC code header to extract lower level HUCs.

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the entire raster is loaded

... Arguments passed to nhdplusTools::get_huc()

Value

a SpatVector object

Author(s)

Insang Song

See Also

```
nhdplusTools::get_huc
```

Examples

```
## NOTE: Examples are wrapped in `\dontrun{}` as function requires a large
         amount of data which is not included in the package.
## Not run:
library(terra)
getf <- "WBD_National_GDB.gdb"</pre>
# check the layer name to read
terra::vector_layers(getf)
test1 <- process_huc(</pre>
 getf,
 layer_name = "WBDHU8",
 huc_level = "huc8"
)
test2 <- process_huc(</pre>
 getf,
 layer_name = "WBDHU8",
 huc_level = "huc8"
)
test3 <- process_huc(</pre>
 layer_name = NULL,
 huc_level = NULL,
 huc_header = NULL,
 id = "030202",
 type = "huc06"
## End(Not run)
```

process_koppen_geiger Process climate classification data

Description

The process_koppen_geiger() function imports and cleans raw climate classification data, returning a single SpatRaster object.

Usage

```
process_koppen_geiger(path = NULL, extent = NULL, ...)
```

Arguments

path character(1). Path to Koppen-Geiger climate zone raster file

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the

entire raster is loaded

... Placeholders.

Value

a SpatRaster object

Author(s)

Insang Song

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
kg <- process_koppen_geiger(
   path = "./data/koppen_geiger_data.tif"
)
## End(Not run)</pre>
```

process_merra2 89

process_merra2

Process meteorological and atmospheric data

Description

The process_merra2() function imports and cleans raw atmospheric composition data, returning a single SpatRaster object.

Usage

```
process_merra2(
  date = c("2018-01-01", "2018-01-01"),
  variable = NULL,
  path = NULL,
  extent = NULL,
  ...
)
```

Arguments

```
date character(2). length of 10. Format "YYYY-MM-DD".

variable character(1). MERRA2 variable name(s).

path character(1). Directory with downloaded netCDF (.nc4) files.

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the entire raster is loaded

Placeholders.
```

Value

a SpatRaster object;

Note

Layer names of the returned SpatRaster object contain the variable, pressure level, date, and hour. Pressure level values utilized for layer names are taken directly from raw data and are not edited to retain pressure level information.

Author(s)

Mitchell Manware

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
merra2 <- process_merra2(
   date = c("2024-01-01", "2024-01-10"),
   variable = "CPT",
   path = "./data/inst1_2d_int_Nx"
)
## End(Not run)</pre>
```

process_modis_merge

Process MODIS .hdf files

Description

Get mosaicked or merged raster from multiple MODIS hdf files.

Usage

```
process_modis_merge(
  path = NULL,
  date = NULL,
  subdataset = NULL,
  fun_agg = "mean",
   ...
)
```

Arguments

character. Full list of hdf file paths. preferably a recursive search result from base::list.files.

date character(1). date to query. Should be in "YYYYY-MM-DD" format.

subdataset character(1). subdataset names to extract. Should conform to regular expression. See base::regex for details. Default is NULL, which will result in errors. Users should specify which subdatasets will be imported.

fun_agg Function name or custom function to aggregate overlapping cell values. See fun description in terra::tapp for details.

For internal use.

Value

```
a SpatRaster object
```

process_modis_sds 91

Note

Curvilinear products (i.e., swaths) will not be accepted. MODIS products downloaded by functions in amadeus, MODISTools, and luna are accepted.

mod09ga_merge <- process_modis_merge(
   path =
        list.files("./data", pattern = "MOD09GA.", full.names = TRUE),
        date = "2024-01-01",
        subdataset = "sur_refl_b01_1",
        fun_agg = "mean"
)
## End(Not run)</pre>
```

process_modis_sds

Process MODIS sub-datasets

Description

Selected MODIS sinusoidal grid product subdataset name selector. Four presets are supported. custom_sel supersedes presets of product values.

Usage

```
process_modis_sds(
  product = c("MOD11A1", "MOD13A2", "MOD09GA", "MCD19A2"),
  custom_sel = NULL,
  ...
)
```

Arguments

```
product character(1). Product code.custom_sel character(1). Custom filter. If this value is not NULL, preset filter is overridden.... Placeholders.
```

92 process_modis_swath

Value

A character object that conforms to the regular expression. Details of regular expression in R can be found in regexp.

Note

Preset product codes and associated variables include

- "MOD11A1" Land surface temperature (LST)
- "MOD13A2" Normalized Difference Vegetation Index (NDVI)
- "MOD09GA" Surface reflectance, and
- "MCD19A2" Aerosol optical depth (AOD).

For a full list of available MODIS product codes, see the "Short Name" column at NASA LP DAAC Search Data Catalog. When utilizing a product code from this "Short Name" column, **do not include** the version number following the period. For example, if "Short Name" = MCD12C1.006, then product = "MCD12C1".

process_modis_sds(product = "MOD09GA")
```

process_modis_swath

Mosaic MODIS swaths

Description

This function will return a SpatRaster object with values of selected subdatasets. Swath data include curvilinear grids, which require warping/rectifying the original curvilinear grids into rectilinear grids. The function internally warps each of inputs then mosaic the warped images into one large SpatRaster object. Users need to select a subdataset to process. The full path looks like "HDF4_EOS:EOS_SWATH:{file_path}:mod06:subdataset", where file_path is the full path to the hdf file.

process_modis_swath 93

Usage

```
process_modis_swath(
  path = NULL,
  date = NULL,
  subdataset = NULL,
  suffix = ":mod06:",
  resolution = 0.05,
  ...
)
```

Arguments

```
character. Full paths of hdf files.

date character(1). Date to query.

subdataset character. Subdatasets to process. Unlike other preprocessing functions, this argument should specify the exact subdataset name. For example, when using MOD06_L2 product, one may specify c("Cloud_Fraction", "Cloud_Optical_Thickness"), etc. The subdataset names can be found in terra::describe() output.

suffix character(1). Should be formatted:{product}:, e.g., :mod06:

resolution numeric(1). Resolution of output raster. Unit is degree (decimal degree in WGS84).

For internal use.
```

Value

- a SpatRaster object (crs = "EPSG: 4326"): if path is a single file with full specification of subdataset.
- a SpatRaster object (crs = "EPSG: 4326"): if path is a list of files. In this case, the returned object will have the maximal extent of multiple warped layers

## Not run:
mod0612_swath <- process_modis_swath(</pre>
```

process_modis_warp

```
path = list.files(
   "./data/mod0612",
   full.names = TRUE,
   pattern = ".hdf"
),
   date = "2024-01-01",
   subdataset = "Cloud_Fraction",
   suffix = ":mod06:",
   resolution = 0.05
)

## End(Not run)
```

process_modis_warp

Warp MODIS swath data into rectilinear grid raster

Description

Swath data is a type of MODIS data, where curvilinear points are stored with varying resolution depending on the relative position of the sensor axis. As this type of data typically does not work well with planar spatial data, users should warp or rectify this data into a rectilinear raster. Main procedure is done with stars::st_warp, in which users are able to customize the threshold to fill potential gaps that appear where the target resolution is finer than the local resolution of curvilinear grid points.

Usage

```
process_modis_warp(
  path = NULL,
  cellsize = 0.1,
  threshold = cellsize * 4,
  crs = 4326,
  ...
)
```

Arguments

path File path of MODIS swath with exact sub-dataset specification.

cellsize numeric(1). Cell size (spatial resolution) of output rectilinear grid raster.

threshold numeric(1). Maximum distance to fill gaps if occur.

crs integer(1)/character(1). Coordinate system definition. Should be compatible with EPSG codes or WKT2. See terra::crs and sf::st_crs / EPSG

... For internal use.

Value

```
a stars object
```

process_narr 95

Note

This function handles one file at a time.

Author(s)

Insang Song

See Also

```
terra::rectify
```

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
         amount of data which is not included in the package.

      full.names = TRUE,
      pattern = ".hdf"
    )[1],
    ":mod06:Cloud_Fraction"
  ),
  cellsize = 0.1,
  threshold = 0.4,
  crs = 4326
## End(Not run)
```

process_narr

Process meteorological data

Description

The process_narr() function imports and cleans raw meteorological data, returning a single SpatRaster object.

```
process_narr(
  date = c("2023-09-01", "2023-09-01"),
  variable = NULL,
  path = NULL,
  extent = NULL,
  ...
)
```

96 process_nei

Arguments

character(2). length of 10 each. Start/end date of downloaded data. Format YYYY-MM-DD (ex. September 1, 2023 = "2023-09-01").

variable character(1). Variable name acronym. See List of Variables in NARR Files for variable names and acronym codes.

path character(1). Directory with downloaded netCDF (.nc) files.

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the entire raster is loaded

... Placeholders.

Value

a SpatRaster object

Note

Layer names of the returned SpatRaster object contain the variable acronym, pressure level, and date.

Author(s)

Mitchell Manware

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
process_narr(
   date = c("2018-01-01", "2018-01-01"),
   variable = "weasd",
   path = "./tests/testdata/narr/weasd"
)
## End(Not run)
```

process_nei

Process road emissions data

Description

The process_nei() function imports and cleans raw road emissions data, returning a single SpatVector object.

NEI data comprises multiple csv files where emissions of 50+ pollutants are recorded at county level. With raw data files, this function will join a combined table of NEI data and county boundary, then perform a spatial join to target locations.

process_nlcd 97

Usage

```
process_nei(path = NULL, county = NULL, year = c(2017, 2020), ...)
```

Arguments

path character(1). Directory with NEI csv files.

county SpatVector/sf. County boundaries.

year integer(1) Year to use. Currently only 2017 or 2020 is accepted.

... Placeholders.

Value

a SpatVector object

Note

Base files for county argument can be downloaded directly from U.S. Census Bureau or by using tigris package. This function does not reproject census boundaries. Users should be aware of the coordinate system of census boundary data for other analyses.

Author(s)

Insang Song

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
nei <- process_nei(
   path = "./data",
   county = system.file("gpkg/nc.gpkg", package = "sf"),
   year = 2017
)
## End(Not run)</pre>
```

process_nlcd

Process land cover data

Description

The process_nlcd() function imports and cleans raw land cover data, returning a single SpatRaster object.

Reads NLCD file of selected year.

98 process_prism

Usage

```
process_nlcd(path = NULL, year = 2021, extent = NULL, ...)
```

Arguments

path character giving nlcd data path

year numeric giving the year of NLCD data used

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the

entire raster is loaded

... Placeholders.

Value

a SpatRaster object

Author(s)

Eva Marques, Insang Song

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
nlcd <- process_nlcd(
   path = "./data/",
   year = 2021
)
## End(Not run)</pre>
```

process_prism

Process PRISM data

Description

This function imports and cleans raw PRISM data, returning a single SpatRaster object.

Reads time series or 30-year normal PRISM data.

```
process_prism(path = NULL, element = NULL, time = NULL, extent = NULL, ...)
```

process_sedac_groads 99

Arguments

path character giving PRISM data path Both file and directory path are acceptable.

element character(1). PRISM element name

time character(1). PRISM time name. Should be character in length of 2, 4, 6, or 8.

"annual" is acceptable.

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the

entire raster is loaded

... Placeholders.

Value

a SpatRaster object with metadata of time and element.

Author(s)

Insang Song

See Also

```
terra::rast, terra::metags
```

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
prism <- process_prism(
   path = "./data/PRISM_ppt_stable_4kmM3_202104_nc.nc",
   element = "ppt",
   time = "202104"
)
## End(Not run)</pre>
```

Description

The process_sedac_groads() function imports and cleans raw road data, returning a single SpatVector object.

```
process_sedac_groads(path = NULL, extent = NULL, ...)
```

Arguments

path character(1). Path to geodatabase or shapefiles.

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the

entire raster is loaded

... Placeholders.

Value

a SpatVector object

Note

U.S. context. The returned SpatVector object contains a \$description column to represent the temporal range covered by the dataset. For more information, see https://sedac.ciesin.columbia.edu/data/set/groads-global-roads-open-access-v1/metadata.

Author(s)

Insang Song

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
groads <- process_sedac_groads(
   path = "./data/groads_example.shp"
)
## End(Not run)</pre>
```

process_sedac_population

Process population density data

Description

The process_secac_population() function imports and cleans raw population density data, returning a single SpatRaster object.

```
process_sedac_population(path = NULL, extent = NULL, ...)
```

process_terraclimate 101

Arguments

```
    character(1). Path to GeoTIFF (.tif) or netCDF (.nc) file.
    extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the entire raster is loaded
    ... Placeholders.
```

Value

```
a SpatRaster object
```

Author(s)

Mitchell Manware

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
pop <- process_sedac_population(
   path = "./data/sedac_population_example.tif"
)
## End(Not run)</pre>
```

```
process_terraclimate Process TerraClimate data
```

Description

The process_terraclimate() function imports and cleans climate and water balance data, returning a single SpatRaster object.

```
process_terraclimate(
  date = c("2023-09-01", "2023-09-01"),
  variable = NULL,
  path = NULL,
  extent = NULL,
  ...
)
```

102 process_tri

Arguments

character(2). length of 10 each. Start/end date of downloaded data. Format YYYY-MM-DD (ex. September 1, 2023 = "2023-09-01").

variable character(1). Variable name or acronym code. See TerraClimate Direct Downloads for variable names and acronym codes.

path character(1). Directory with downloaded netCDF (.nc) files.

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the entire raster is loaded

... Placeholders.

Value

a SpatRaster object

Note

Layer names of the returned SpatRaster object contain the variable acronym, year, and month.

TerraClimate data has monthly temporal resolution, so the first day of each month is used as a placeholder temporal value.

Author(s)

Mitchell Manware

Examples

```
## NOTE: Example is wrapped in `\dontrun{}` as function requires a large
## amount of data which is not included in the package.
## Not run:
terraclimate <- process_terraclimate(
   date = c("2023-01-01", "2023-01-10"),
   variable = "Precipitation",
   path = "./data/ppt"
)
## End(Not run)</pre>
```

process_tri

Process toxic release data

Description

This function imports and cleans raw toxic release data, returning a single SpatVector (points) object for the selected year.

process_tri 103

Usage

```
process_tri(
  path = NULL,
  year = 2018,
  variables = c(1, 13, 12, 14, 20, 34, 36, 47, 48, 49),
  extent = NULL,
  ...
)
```

Arguments

path character(1). Path to the directory with TRI CSV files

year integer(1). Single year to select.

variables integer. Column index of TRI data.

extent numeric(4) or SpatExtent giving the extent of the raster if NULL (default), the entire raster is loaded

... Placeholders.

Value

a SpatVector object (points) in year year is stored in a field named "year".

Note

Visit TRI Data and Tools to view the available years and variables.

Author(s)

Insang Song, Mariana Kassien

```

sftime_as_sf

sftime_as_mysftime

 $Convert\ an\ {\it sftime}\ to\ a\ {\it mysftime}$

Description

Convert an sftime object to a mysftime object. x must contain a time-defining column, identified in timename.

Usage

```
sftime_as_mysftime(x, timename)
```

Arguments

x an sftime object

timename character: name of time column in x

Value

an sftime object with specific format

Author(s)

Eva Marques

See Also

check_mysftime

 $sftime_as_sf$

Convert an sftime to an sf

Description

Convert an sftime object to an sf object. x must contain a time-defining column, identified in timename.

Usage

```
sftime_as_sf(x, keeptime = TRUE)
```

Arguments

x an sftime object

keeptime boolean: TRUE if user wants to keep time column as simple column (default =

TRUE)

sftime_as_spatraster 105

Value

an sf object

Author(s)

Eva Marques

 ${\tt sftime_as_spatraster} \quad \textit{Convert an } {\tt sftime} \ \textit{to} \ \textit{a} \ {\tt SpatRaster}$

Description

Convert an sftime object to a SpatRaster object. Returns a SpatRaster with one layer for each time step in x.

Usage

```
sftime_as_spatraster(x, varname)
```

Arguments

x an sftime objectvarname variable to rasterize

Value

a SpatRaster object

Note

Running sftime_as_spatraster can take a long time if x is not spatially structured.
