Package 'spant'

December 17, 2024

Type Package

```
Title MR Spectroscopy Analysis Tools
Version 3.1.0
Date 2024-12-17
Description Tools for reading, visualising and processing Magnetic Resonance
     Spectroscopy data. The package includes methods for spectral fitting: Wilson
     (2021) <DOI:10.1002/mrm.28385> and spectral alignment: Wilson (2018)
     <DOI:10.1002/mrm.27605>.

Description

spant-package

spant provides a set of tools for reading, visualising and processing Magnetic Resonance Spectroscopy (MRS) data.

spant: spectroscopy analysis tools.

10 abfit_opts

Details

```
To get started with spant, take a look at the introduction vignette: vignette("spant-intro", package="spant")

)
```

12 abfit_opts

Arguments

init_damping initial value of the Gaussian global damping parameter (Hz). Very poorly shimmed or high field data may benefit from a larger value. The maximum number of iterations to run for the detailed fit. maxiters max_shift_pre The maximum allowable global shift to be applied in the approximate (pre-fit) phases of analysis (ppm). max_shift_fine The maximum allowable global shift to be applied in the detailed fit phase of analysis (ppm). max_damping maximum permitted value of the global damping parameter (Hz). max_phase the maximum absolute permitted value of the global zero-order phase term (degrees). Note, the prefit_phase_search option is not constrained by this term. lambda manually set the baseline smoothness parameter. ppm_left downfield frequency limit for the fitting range (ppm). upfield frequency limit for the fitting range (ppm). ppm_right zero pad the data to twice the original length before fitting. zp bl_ed_pppm manually set the baseline smoothness parameter (ED per ppm). auto_bl_flex automatically determine the level of baseline smoothness. bl_comps_pppm spline basis density (signals per ppm). adaptive_bl_comps_pppm adjust the spline basis density in the detailed fit phase, based on the required level of smoothness, to reduce computation time. export_sp_fit add the fitted spline functions to the fit result. maximum allowable value of the asymmetry parameter. max_asym max_basis_shift maximum allowable frequency shift for individual basis signals (ppm). max_basis_damping maximum allowable Lorentzian damping factor for individual basis signals (Hz). maxiters_pre maximum iterations for the coarse (pre-)fit. algo_pre optimisation method for the coarse (pre-)fit. min_bl_ed_pppm minimum value for the candidate baseline flexibility analyses (ED per ppm). max_bl_ed_pppm minimum value for the candidate baseline flexibility analyses (ED per ppm). auto_bl_flex_n number of candidate baseline analyses to perform. pre_fit_bl_ed_pppm level of baseline flexibility to use in the coarse fitting stage of the algorithm (ED per ppm). remove_lip_mm_prefit remove broad signals in the coarse fitting stage of the algorithm. pre_align perform a pre-alignment step before coarse fitting. max_pre_align_shift maximum allowable shift in the pre-alignment step (ppm).

abfit_opts 13

pre_align_ref_freqs

a vector of prominent spectral frequencies used in the pre-alignment step (ppm).

noise_region spectral region to estimate the noise level (ppm).

optimal_smooth_criterion

method to determine the optimal smoothness.

aic_smoothing_factor

modification factor for the AIC calculation. Larger values result in less flexible baselines.

anal_jac use a analytical approximation to the jacobian in the detailed fitting stage.

pre_fit_ppm_left

downfield frequency limit for the fitting range in the coarse fitting stage of the algorithm (ppm).

pre_fit_ppm_right

upfield frequency limit for the fitting range in the coarse fitting stage of the algorithm (ppm).

phi1_optim apply and optimise a frequency dependant phase term.

phi1_init initial value for the frequency dependant phase term (ms).

max_dphi1 maximum allowable change from the initial frequency dependant phase term (ms).

max_basis_shift_broad

maximum allowable shift for broad signals in the basis (ppm). Determined based on their name beginning with Lip or MM. The default value is set to max basis shift.

 ${\tt max_basis_damping_broad}$

maximum allowable Lorentzian damping for broad signals in the basis (Hz). Determined based on their name beginning with Lip or MM. The default value is set to max basis damping.

ahat_calc_method

method to calculate the metabolite amplitudes. May be one of: "lh_pnnls" or "ls".

prefit_phase_search

perform a 1D search for the optimal phase in the prefit stage of the algorithm.

freq_reg frequency shift parameter.

freq_reg_naa frequency shift parameter for NAA and NAAG.

1b_reg individual line broadening parameter.

asym_reg lineshape asymmetry parameter.

output_all_paras

include more fitting parameters in the fit table, e.g. individual shift and damping factors for each basis set element.

output_all_paras_raw

include raw fitting parameters in the fit table. For advanced diagnostic use only.

input_paras_raw

input raw fitting parameters. For advanced diagnostic use only.

optim_lw_only optimize the global line-broadening term only.

abfit_opts_v1_9_0

optim_lw_only_limit

limits for the line-breading term as a percentage of the starting value when op-

tim_lw_only is TRUE.

1b_init initial Lorentzian line broadening value (in Hz) for the individual basis signals.

Setting to 0 will clash with the minimum allowable value (eg hard constraint)

during the detailed fit.

lb_init_approx_fit

apply lb_init to the basis during the approximate iterative fit.

zf_offset offset in number of data points from the end of the FID to zero-fill. Default is

NULL and will automatically set this to 50 points when the FID distortion flag

is set for the mrs_data.

Value

full list of options.

Examples

```
opts <- abfit_opts(ppm_left = 4.2, noise_region = c(-1, -3))
```

abfit_opts_v1_9_0

Return a list of options for an ABfit analysis to maintain comparability with analyses performed with version 1.9.0 (and earlier) of spant.

Description

Return a list of options for an ABfit analysis to maintain comparability with analyses performed with version 1.9.0 (and earlier) of spant.

Usage

```
abfit_opts_v1_9_0(...)
```

Arguments

... arguments passed to abfit_opts.

Value

full list of options.

abfit_reg_opts 15

abfit_reg_opts

Return a list of options for an ABfit analysis with regularision.

Description

Return a list of options for an ABfit analysis with regularision.

Usage

```
abfit_reg_opts(
  init_damping = 5,
 maxiters = 128,
 max\_shift\_pre = 0.078,

)
```

Arguments

max_basis_shift

initial value of the Gaussian global damping parameter (Hz). Very poorly shimmed init_damping or high field data may benefit from a larger value. maxiters The maximum number of iterations to run for the detailed fit. max_shift_pre The maximum allowable global shift to be applied in the approximate (pre-fit) phases of analysis (ppm). max_shift_fine The maximum allowable global shift to be applied in the detailed fit phase of analysis (ppm). max_damping maximum permitted value of the global damping parameter (Hz). max_phase the maximum absolute permitted value of the global zero-order phase term (degrees). Note, the prefit_phase_search option is not constrained by this term. lambda manually set the baseline smoothness parameter. downfield frequency limit for the fitting range (ppm). ppm_left ppm_right upfield frequency limit for the fitting range (ppm). zero pad the data to twice the original length before fitting. zp manually set the baseline smoothness parameter (ED per ppm). bl_ed_pppm auto_bl_flex automatically determine the level of baseline smoothness. bl_comps_pppm spline basis density (signals per ppm). adaptive_bl_comps_pppm adjust the spline basis density in the detailed fit phase, based on the required level of smoothness, to reduce computation time. add the fitted spline functions to the fit result. export_sp_fit maximum allowable value of the asymmetry parameter. max_asym

maximum allowable frequency shift for individual basis signals (ppm).

abfit_reg_opts 17

max_basis_damping

maximum allowable Lorentzian damping factor for individual basis signals (Hz).

maxiters_pre maximum iterations for the coarse (pre-)fit.

algo_pre optimisation method for the coarse (pre-)fit.

min_bl_ed_pppm minimum value for the candidate baseline flexibility analyses (ED per ppm).

max_bl_ed_pppm minimum value for the candidate baseline flexibility analyses (ED per ppm).

auto_bl_flex_n number of candidate baseline analyses to perform.

pre_fit_bl_ed_pppm

level of baseline flexibility to use in the coarse fitting stage of the algorithm (ED per ppm).

remove_lip_mm_prefit

remove broad signals in the coarse fitting stage of the algorithm.

pre_align perform a pre-alignment step before coarse fitting.

max_pre_align_shift

maximum allowable shift in the pre-alignment step (ppm).

pre_align_ref_freqs

a vector of prominent spectral frequencies used in the pre-alignment step (ppm).

noise_region spectral region to estimate the noise level (ppm).

optimal_smooth_criterion

method to determine the optimal smoothness.

aic_smoothing_factor

modification factor for the AIC calculation. Larger values result in less flexible baselines.

anal_jac use a analytical approximation to the jacobian in the detailed fitting stage.

pre_fit_ppm_left

downfield frequency limit for the fitting range in the coarse fitting stage of the algorithm (ppm).

pre_fit_ppm_right

upfield frequency limit for the fitting range in the coarse fitting stage of the algorithm (ppm).

phi1_optim apply and optimise a frequency dependant phase term.

phi1_init initial value for the frequency dependant phase term (ms).

max_dphi1 maximum allowable change from the initial frequency dependant phase term (ms).

max_basis_shift_broad

maximum allowable shift for broad signals in the basis (ppm). Determined based on their name beginning with Lip or MM. The default value is set to max_basis_shift.

max_basis_damping_broad

maximum allowable Lorentzian damping for broad signals in the basis (Hz). Determined based on their name beginning with Lip or MM. The default value is set to max_basis_damping.

18 acquire

ahat_calc_method

method to calculate the metabolite amplitudes. May be one of: "lh_pnnls" or "ls".

prefit_phase_search

perform a 1D search for the optimal phase in the prefit stage of the algorithm.

freq_reg frequency shift parameter.

freq_reg_naa frequency shift parameter for NAA and NAAG.

lb_reg individual line broadening parameter.

asym_reg lineshape asymmetry parameter.

output_all_paras

include more fitting parameters in the fit table, e.g. individual shift and damping factors for each basis set element.

output_all_paras_raw

include raw fitting parameters in the fit table. For advanced diagnostic use only.

input_paras_raw

input raw fitting parameters. For advanced diagnostic use only.

optim_lw_only optimize the global line-broadening term only.

optim_lw_only_limit

limits for the line-breading term as a percentage of the starting value when op-

tim_lw_only is TRUE.

1b_init initial Lorentzian line broadening value (in Hz) for the individual basis signals. Setting to 0 will clash with the minimum allowable value (eg hard constraint)

during the detailed fit.

lb_init_approx_fit

apply lb_init to the basis during the approximate iterative fit.

zf_offset offset in number of data points from the end of the FID to zero-fill. Default is

NULL and will automatically set this to 50 points when the FID distortion flag

is set for the mrs_data.

Value

full list of options.

Examples

```
opts <- abfit_reg_opts(ppm_left = 4.2, noise_region = c(-1, -3))
```

acquire

Simulate pulse sequence acquisition.

Description

Simulate pulse sequence acquisition.

add_noise 19

Usage

```
acquire(sys, rec_phase = 0, tol = 1e-04, detect = NULL, amp_scale = 1)
```

Arguments

sys spin system object.

rec_phase receiver phase in degrees.

tol ignore resonance amplitudes below this threshold.

detect detection nuclei.

amp_scale scaling factor for the output amplitudes.

Value

a list of resonance amplitudes and frequencies.

add_noise

Add noise to an mrs_data object.

Description

Add noise to an mrs_data object.

Usage

```
add_noise(mrs_data, sd = 0.1, fd = TRUE)
```

Arguments

mrs_data data to add noise to.

sd standard deviation of the noise.

fd generate the noise samples in the frequency-domain (TRUE) or time-domain

(FALSE). This is required since the absolute value of the standard deviation of

noise samples changes when data is Fourier transformed.

Value

mrs_data object with additive normally distributed noise.

20 align

add_noise_spec_snr

Add noise to an mrs_data object to match a given SNR.

Description

Add noise to an mrs_data object to match a given SNR.

Usage

```
add_noise_spec_snr(
  mrs_data,
  target_snr,
  sig_region = c(4, 0.5),
  ref_data = NULL
)
```

Arguments

mrs_data data to add noise to.

target_snr desired spectral SNR, note this assumes the input data is noise-free, eg simulated

data. Note the SNR is estimated from the first scan in the dataset and the same

noise level is added to all spectra.

sig_region spectral limits to search for the strongest spectral data point.

ref_data measure the signal from the first scan in this reference data and apply the same

target noise level to mrs_data.

Value

mrs_data object with additive normally distributed noise.

method.	align	Align spectra to a reference frequency using a convolution based method.
---------	-------	--

Description

Align spectra to a reference frequency using a convolution based method.

apodise_xy 21

Usage

```
align(
  mrs_data,
  ref_freq = 4.65,
  ref_amp = 1,
  zf_factor = 2,
  lb = 2,
  max_shift = 20,
  ret_df = FALSE,
  mean_dyns = FALSE
)
```

Arguments

mrs_data	data to be aligned.
ref_freq	reference frequency in ppm units. More than one frequency may be specified.
ref_amp	amplitude value for the reference signal. More than one value may be specified to match the number of ref_freq signals.
zf_factor	zero filling factor to increase alignment resolution.
1b	line broadening to apply to the reference signal.
max_shift	maximum allowable shift in Hz.
ret_df	return frequency shifts in addition to aligned data (logical).
mean_dyns	align the mean spectrum and apply the same shift to each dynamic.

Value

aligned data object.

apodise_xy

Apodise MRSI data in the x-y direction with a k-space filter.

Description

Apodise MRSI data in the x-y direction with a k-space filter.

Usage

```
apodise_xy(mrs_data, func = "hamming", w = 2.5)
```

Arguments

```
mrs_data MRSI data.

func must be "hamming", "hanning" or "gaussian".

w the reciprocal of the standard deviation for the Gaussian function.
```

22 append_coils

Value

apodised data.

append_basis

Combine a pair of basis set objects.

Description

Combine a pair of basis set objects.

Usage

```
append_basis(basis_a, basis_b)
```

Arguments

basis_a first basis.
basis_b second basis.

Value

combined basis set object.

append_coils

Append MRS data across the coil dimension, assumes they matched across the other dimensions.

Description

Append MRS data across the coil dimension, assumes they matched across the other dimensions.

Usage

```
append_coils(...)
```

Arguments

... MRS data objects as arguments, or a list of MRS data objects.

Value

a single MRS data object with the input objects concatenated together.

append_dyns 23

append_dyns	Append MRS data across the dynamic dimension, assumes they	
	matched across the other dimensions.	

Description

Append MRS data across the dynamic dimension, assumes they matched across the other dimensions

Usage

```
append_dyns(...)
```

Arguments

... MRS data objects as arguments, or a list of MRS data objects.

Value

a single MRS data object with the input objects concatenated together.

append_regs

Append multiple regressor data frames into a single data frame.

Description

Append multiple regressor data frames into a single data frame.

Usage

```
append_regs(...)
```

Arguments

... input regressor data frames.

Value

output regressor data frame.

24 apply_mrs

apply_axes

Apply a function over specified array axes.

Description

Apply a function over specified array axes.

Usage

```
apply_axes(x, axes, fun, ...)
```

Arguments

```
x an array.axes a vector of axes to apply fun over.fun function to be applied.
```

optional arguments to fun.

Value

array.

. . .

Examples

```
z <- array(1:1000, dim = c(10, 10, 10))
a <- apply_axes(z, 3, fft)
a[1,1,] == fft(z[1,1,])
a <- apply_axes(z, 3, sum)
a[1,1,] == sum(z[1,1,])</pre>
```

apply_mrs

Apply a function across given dimensions of a MRS data object.

Description

Apply a function across given dimensions of a MRS data object.

Usage

```
apply_mrs(mrs_data, dims, fun, ..., data_only = FALSE)
```

apply_pulse 25

Arguments

mrs_data MRS data.

dims dimensions to apply the function.

fun name of the function.

... arguments to the function.

data_only return an array rather than an MRS data object.

apply_pulse

Simulate an RF pulse on a single spin.

Description

Simulate an RF pulse on a single spin.

Usage

```
apply_pulse(sys, rho, spin_n, angle, nuc, xy)
```

Arguments

sys spin system object.

rho density matrix.

spin_n spin index.

angle RF flip angle in degrees.

nuc nucleus influenced by the pulse.

xy x or y pulse.

Value

density matrix.

26 array2mrs_data

Arg.mrs_data

Apply Arg operator to an MRS dataset.

Description

Apply Arg operator to an MRS dataset.

Usage

```
## S3 method for class 'mrs_data'
Arg(z)
```

Arguments

z

MRS data.

Value

MRS data following Arg operator.

array2mrs_data

Convert a 7 dimensional array in into a mrs_data object. The array dimensions should be ordered as: dummy, X, Y, Z, dynamic, coil, FID.

Description

Convert a 7 dimensional array in into a mrs_data object. The array dimensions should be ordered as: dummy, X, Y, Z, dynamic, coil, FID.

Usage

```
array2mrs_data(
  data_array,
  mrs_data = NULL,
  fs = NULL,
  ft = NULL,
  ref = NULL,
  nuc = NULL,
  fd = FALSE
)
```

auto_phase 27

Arguments

data_array 7d data array.

mrs_data example data to copy acquisition parameters from.

fs sampling frequency in Hz.

ft transmitter frequency in Hz.

ref reference value for ppm scale.

nuc nucleus that is resonant at the transmitter frequency.

fd flag to indicate if the matrix is in the frequency domain (logical).

Value

mrs_data object.

auto_phase Perform zeroth-order phase correction based on the minimisation of

the squared difference between the real and magnitude components of

the spectrum.

Description

Perform zeroth-order phase correction based on the minimisation of the squared difference between the real and magnitude components of the spectrum.

Usage

```
auto_phase(mrs_data, xlim = c(4, 1.8), smo_ppm_sd = 0.05, ret_phase = FALSE)
```

Arguments

mrs_data an object of class mrs_data.

xlim frequency range (default units of PPM) to including in the phase.

smo_ppm_sd Gaussian smoother sd in ppm units.

ret_phase return phase values (logical).

Value

MRS data object and phase values (optional).

28 basis2dyn_mrs_data

model.		back_extrap_ar	Back extrapolate time-domain data points using an autoregressive model.	
--------	--	----------------	---	--

Description

Back extrapolate time-domain data points using an autoregressive model.

Usage

```
back_extrap_ar(
  mrs_data,
  extrap_pts,
  pred_pts = NULL,
  method = "burg",
  rem_add = TRUE,
  ...
)
```

Arguments

mrs_data mrs_data object.

extrap_pts number of points to extrapolate.

pred_pts number of points to base the extrapolation on.

method character string specifying the method to fit the model. Must be one of the strings in the default argument (the first few characters are sufficient). Defaults to "burg".

rem_add remove additional points from the end of the FID to maintain the original length of the dataset. Default to TRUE.

... additional arguments to specific methods, see ?ar.

Value

back extrapolated data.

Description

Convert a basis object to a dynamic mrs_data object.

Usage

```
basis2dyn_mrs_data(basis, amps, tr)
```

basis2mrs_data 29

Arguments

basis basis set object.

amps a data frame with each column corresponding to a basis element and each row

corresponding to each dynamic scan.

tr the dataset repetition time in seconds.

Value

a dynamic mrs_data object.

basis2mrs_data

Convert a basis object to an mrs_data object - where basis signals are

spread across the dynamic dimension.

Description

Convert a basis object to an mrs_data object - where basis signals are spread across the dynamic dimension.

Usage

```
basis2mrs_data(
  basis,
  sum_elements = FALSE,
  amps = NULL,
  shifts = NULL,
  lbs = NULL
)
```

Arguments

basis basis set object.

sum_elements return the sum of basis elements (logical)

amps a vector of scaling factors to apply to each basis element.

shifts a vector of frequency shifts (in ppm) to apply to each basis element.

1bs a vector of Lorentzian line broadening terms (in Hz) to apply to each basis ele-

ment.

Value

an mrs_data object with basis signals spread across the dynamic dimension or summed.

30 bc_als

bbase	Generate a spline basis, slightly adapted from: "Splines, knots, and penalties", Eilers 2010.
	penances, Eners 2010.

Description

Generate a spline basis, slightly adapted from: "Splines, knots, and penalties", Eilers 2010.

Usage

```
bbase(N, number, deg = 3)
```

Arguments

N number of data points. number number of spline functions.

deg spline degree : deg = 1 linear, deg = 2 quadratic, deg = 3 cubic.

Value

spline basis as a matrix.

bc_als

Baseline correction using the ALS method.

Description

Eilers P. H. C. and Boelens H. F. M. (2005) Baseline correction with asymmetric least squares smoothing. Leiden Univ. Medical Centre Report.

Usage

```
bc_als(mrs_data, lambda = 10000, p = 0.001, ret_bc_only = TRUE)
```

Arguments

mrs_data mrs_data object.

lambda controls the baseline flexibility.

p controls the penalty for negative data points.

ret_bc_only return the baseline corrected data only. When FALSE the baseline estimate and

input data will be returned.

Value

baseline corrected data.

bc_constant 31

bc_constant	Remove a constant baseline offset based on a reference spectral region.
-------------	---

Description

Remove a constant baseline offset based on a reference spectral region.

Usage

```
bc_constant(mrs_data, xlim)
```

Arguments

mrs_data MRS data.

xlim spectral range containing a flat baseline region to measure the offset.

Value

baseline corrected data.

bc_gauss

Apply and subtract a Gaussian smoother in the spectral domain.

Description

Apply and subtract a Gaussian smoother in the spectral domain.

Usage

```
bc_gauss(mrs_data, smo_ppm_sd)
```

Arguments

mrs_data object.

smo_ppm_sd Gaussian smoother sd in ppm units.

Value

smoother subtracted data.

bc_spline

bc_poly

Fit and subtract a polynomial to each spectrum in a dataset.

Description

Fit and subtract a polynomial to each spectrum in a dataset.

Usage

```
bc_poly(mrs_data, p_deg = 1)
```

Arguments

mrs_data mrs_data object.
p_deg polynomial degree.

Value

polynomial subtracted data.

bc_spline

Fit and subtract a smoothing spline to each spectrum in a dataset.

Description

Fit and subtract a smoothing spline to each spectrum in a dataset.

Usage

```
bc_spline(mrs_data, spar = 0.5, nknots = 100)
```

Arguments

mrs_data object.

spar smoothing parameter typically between 0 and 1.

nknots number of spline knots.

Value

smoothing spline subtracted data.

beta2lw 33

beta21w

Covert a beta value in the time-domain to an equivalent linewidth in Hz: x * exp(-i * t * t * beta).

Description

Covert a beta value in the time-domain to an equivalent linewidth in Hz: x * exp(-i * t * t * beta).

Usage

beta21w(beta)

Arguments

beta

beta damping value.

Value

linewidth value in Hz.

bin_spec

Bin equally spaced spectral regions.

Description

Bin equally spaced spectral regions.

Usage

```
bin_spec(mrs_data, width = 0.05, unit = "ppm")
```

Arguments

mrs_data data to be "binned".

width bin width.

unit bin width unit, can be "ppm" (default) or "pts".

Value

binned mrs_data object.

34 calc_basis_crlbs

calc_basis_corr_mat

Estimate the correlation matrix for a basis set.

Description

Estimate the correlation matrix for a basis set.

Usage

```
calc_basis_corr_mat(basis, xlim = c(4, 0.2), zf = TRUE)
```

Arguments

basis_set object.

xlim spectral range to use in ppm.

zf zero-fill the basis set.

Value

correlation matrix.

calc_basis_crlbs

Estimate the CRLB for each element in a basis set.

Description

Estimate the CRLB for each element in a basis set.

Usage

```
calc_basis_crlbs(
  basis,
  xlim = c(4, 0.2),
  zf = TRUE,
  sd = 1,
  bl_comp_pppm = NULL
)
```

Arguments

basis_set object.

xlim spectral range to use in ppm.

zf zero-fill the basis set.

sd standard deviation of the noise.

bl_comp_ppm number spline baseline components to append per-ppm.

calc_coil_noise_cor 35

Value

a vector of predicted errors.

calc_coil_noise_cor

Calculate the noise correlation between coil elements.

Description

Calculate the noise correlation between coil elements.

Usage

```
calc_coil_noise_cor(noise_data)
```

Arguments

noise_data

mrs_data object with one FID for each coil element.

Value

correlation matrix.

calc_coil_noise_sd

Calculate the noise standard deviation for each coil element.

Description

Calculate the noise standard deviation for each coil element.

Usage

```
calc_coil_noise_sd(noise_data)
```

Arguments

noise_data

mrs_data object with one FID for each coil element.

Value

array of standard deviations.

36 calc_ed_from_lambda

```
calc_design_efficiency
```

Calculate the efficiency of a regressor data frame.

Description

Calculate the efficiency of a regressor data frame.

Usage

```
calc_design_efficiency(regressor_df, contrasts)
```

Arguments

regressor_df input regressor data frame. contrasts a vector of contrast values.

calc_ed_from_lambda

Calculate the effective dimensions of a spline smoother from lambda.

Description

Calculate the effective dimensions of a spline smoother from lambda.

Usage

```
calc_ed_from_lambda(spline_basis, deriv_mat, lambda)
```

Arguments

spline_basis spline basis.

deriv_mat derivative matrix.

lambda smoothing parameter.

Value

the effective dimension value.

calc_peak_info_vec 37

calc_peak_info_vec

Calculate the FWHM of a peak from a vector of intensity values.

Description

Calculate the FWHM of a peak from a vector of intensity values.

Usage

```
calc_peak_info_vec(data_pts, interp_f)
```

Arguments

data_pts

input vector.

interp_f

interpolation factor to improve the FWHM estimate.

Value

a vector of: x position of the highest data point, maximum peak value in the y axis, FWHM in the units of data points.

calc_sd_poly

Perform a polynomial fit, subtract and return the standard deviation of the residuals.

Description

Perform a polynomial fit, subtract and return the standard deviation of the residuals.

Usage

```
calc_sd_poly(y, degree = 1)
```

Arguments

y array.

degree polynomial degree.

Value

standard deviation of the fit residuals.

38 calc_spec_snr

calc_spec_diff

Calculate the sum of squares differences between two mrs_data objects.

Description

Calculate the sum of squares differences between two mrs_data objects.

Usage

```
calc_spec_diff(mrs_data, ref = NULL, xlim = c(4, 0.5))
```

Arguments

mrs_data object.

ref reference mrs_data object to calculate differences.

xlim spectral limits to perform calculation.

Value

an array of the sum of squared difference values.

calc_spec_snr

Calculate the spectral SNR.

Description

SNR is defined as the maximum signal value divided by the standard deviation of the noise.

Usage

```
calc_spec_snr(
  mrs_data,
  sig_region = c(4, 0.5),
  noise_region = c(-0.5, -2.5),
  p_order = 2,
  interp_f = 4,
  full_output = FALSE
)
```

check_lcm 39

Arguments

mrs_data an object of class mrs_data.

sig_region a ppm region to define where the maximum signal value should be estimated.

noise_region a ppm region to defined where the noise level should be estimated.

p_order polynomial order to fit to the noise region before estimating the standard devia-

tion.

interp_f interpolation factor to improve detection of the highest signal value.

full_output output signal, noise and SNR values separately.

Details

The mean noise value is subtracted from the maximum signal value to reduce DC offset bias. A polynomial detrending fit (second order by default) is applied to the noise region before the noise standard deviation is estimated.

Value

an array of SNR values.

check_lcm Check LCModel can be run

Description

Check LCModel can be run

Usage

check_lcm()

check_tqn Check the TARQUIN binary can be run

Description

Check the TARQUIN binary can be run

Usage

check_tqn()

40 coherence_filter

circ_mask	Create a logical circular mask spanning the full extent of an n x n
	matrix.

Description

Create a logical circular mask spanning the full extent of an n x n matrix.

Usage

```
circ_mask(d, n, offset = 1)
```

Arguments

d diameter of the mask.

n number of matrix rows and columns.

offset offset the mask centre in matrix dimension units.

Value

logical n x n mask matrix.

coherence_filter

Zero all coherence orders other than the one supplied as an argument.

Description

Zero all coherence orders other than the one supplied as an argument.

Usage

```
coherence_filter(sys, rho, order = 0)
```

Arguments

sys spin system object.
rho density matrix.

order coherence order to keep (default is 0).

Value

density matrix.

collapse_to_dyns 41

collapse_to_dyns	Collapse MRS data by concatenating spectra along the dynamic di-
	mension.

Description

Collapse MRS data by concatenating spectra along the dynamic dimension.

Usage

```
collapse_to_dyns(x, rm_masked = FALSE)
## S3 method for class 'mrs_data'
collapse_to_dyns(x, rm_masked = FALSE)
## S3 method for class 'fit_result'
collapse_to_dyns(x, rm_masked = FALSE)
```

Arguments

```
x data object to be collapsed (mrs_data or fit_result object).
rm_masked remove masked dynamics from the output.
```

Value

collapsed data with spectra or fits concatenated along the dynamic dimension.

comb_coils

Combine coil data based on the first data point of a reference signal.

Description

By default, elements are phased and scaled prior to summation. Where a reference signal is not given, the mean dynamic signal will be used instead.

Usage

```
comb_coils(
  metab,
  ref = NULL,
  noise = NULL,
  scale = TRUE,
  scale_method = "sig_noise_sq",
  sum_coils = TRUE,
  noise_region = c(-0.5, -2.5),
```

42 comb_coils_mrsi_gls

```
average_ref_dyns = TRUE,
ref_pt_index = 1,
ret_metab_only = FALSE
)
```

Arguments

metab MRS data containing metabolite data.

ref MRS data containing reference data (optional).

noise MRS data from a noise scan (optional).

scale option to rescale coil elements based on the first data point (logical).

scale_method one of "sig_noise_sq", "sig_noise" or "sig".

sum_coils sum the coil elements as a final step (logical).

noise_region the spectral region (in ppm) to estimate the noise.

average_ref_dyns

take the mean of the reference scans in the dynamic dimension before use.

ref_pt_index time-domain point to use for estimating phase and scaling values.

ret_metab_only return the metabolite data only, even if reference data has been specified.

Value

MRS data.

Description

Combine MRSI coil data using the GLS method presented by An et al JMRI 37:1445-1450 (2013).

Usage

```
comb_coils_mrsi_gls(metab, noise_pts = 30, noise_mrs = NULL)
```

Arguments

metab MRSI data containing metabolite data.

noise_pts number of points from the end of the FIDs to use for noise covariance estimation.

noise_mrs MRS data containing noise information for each coil.

Value

coil combined MRSI data.

comb_coils_svs_gls 43

comb_coils_svs_gls	Combine SVS coil data using the GLS method presented by An et al
	JMRI 37:1445-1450 (2013).

Description

Combine SVS coil data using the GLS method presented by An et al JMRI 37:1445-1450 (2013).

Usage

```
comb_coils_svs_gls(
  metab,
  ref = NULL,
  noise_pts = 256,
  noise_mrs = NULL,
  use_mean_sens = TRUE
)
```

Arguments

metab MRS data containing metabolite data.

ref MRS data containing reference data (optional).

noise_pts number of points from the end of the FIDs to use for noise covariance estimation.

noise_mrs MRS data containing noise information for each coil.
use_mean_sens use the dynamic mean to estimate coil sensitivities.

Value

coil combined MRS data.

```
comb\_fit\_list\_fit\_tables
```

Combine all fitting data points from a list of fits into a single data frame.

Description

Combine all fitting data points from a list of fits into a single data frame.

Usage

```
comb_fit_list_fit_tables(
  fit_list,
  add_extra = TRUE,
  harmonise_ppm = TRUE,
  inc_basis_sigs = FALSE,
  inc_indices = TRUE,
  add_res_id = TRUE
)
```

Arguments

fit_list list of fit_result objects.

add_extra add variables in the extra data frame to the output (TRUE). harmonise_ppm ensure the ppm scale for each fit is identical to the first.

inc_basis_sigs include the individual fitting basis signals in the output table, defaults to FALSE. inc_indices include indices such as X, Y and coil in the output, defaults to TRUE. These are

generally not useful for SVS analysis.

add_res_id add a res_id column to the output to distinguish between datasets.

Value

a data frame containing the fit data points.

```
comb_fit_list_result_tables
```

Combine the fit result tables from a list of fit results.

Description

Combine the fit result tables from a list of fit results.

Usage

```
comb_fit_list_result_tables(fit_list, add_extra = TRUE, add_res_id = TRUE)
```

Arguments

fit_list a list of fit_result objects.

add_extra add variables in the extra data frame to the output (TRUE).

add_res_id add a res_id column to the output to distinguish between datasets.

Value

a data frame combine all fit result tables with an additional id column to differentiate between data sets. Any variables in the extra data frame may be optionally added to the result.

comb_fit_tables 45

comb	fit	tah]	۱۵۶

Combine all fitting data points into a single data frame.

Description

Combine all fitting data points into a single data frame.

Usage

```
comb_fit_tables(fit_res, inc_basis_sigs = FALSE, inc_indices = TRUE)
```

Arguments

fit_res a single fit_result object.

inc_basis_sigs include the individual fitting basis signals in the output table, defaults to FALSE.

inc_indices include indices such as X, Y and coil in the output, defaults to TRUE. These are

generally not useful for SVS analysis.

Value

a data frame containing the fit data points.

comb_metab_ref

Combine a reference and metabolite mrs_data object.

Description

Combine a reference and metabolite mrs_data object.

Usage

```
comb_metab_ref(metab, ref)
```

Arguments

metab metabolite mrs_data object.
ref reference mrs_data object.

Value

combined metabolite and reference mrs_data object.

46 conv_mrs

Conj.mrs_data

Apply Conj operator to an MRS dataset.

Description

Apply Conj operator to an MRS dataset.

Usage

```
## S3 method for class 'mrs_data'
Conj(z)
```

Arguments

Z

MRS data.

Value

MRS data following Conj operator.

conv_mrs

Convolve two MRS data objects.

Description

Convolve two MRS data objects.

Usage

```
conv_mrs(mrs_data, conv)
```

Arguments

mrs_data

MRS data to be convolved.

conv

convolution data stored as an mrs_data object.

Value

convolved data.

crop_basis 47

Description

Crop basis_set object based on a frequency range.

Usage

```
crop_basis(basis, xlim = c(4, 0.2), scale = "ppm")
```

Arguments

basis_set object to be cropped in the spectral dimension.

xlim range of values to crop in the spectral dimension eg xlim = c(4, 0.2).

scale the units to use for the frequency scale, can be one of: "ppm", "hz" or "points".

Value

cropped mrs_data object.

crop_spec

Crop mrs_data object based on a frequency range.

Description

Crop mrs_data object based on a frequency range.

Usage

```
crop_spec(mrs_data, xlim = c(4, 0.2), scale = "ppm")
```

Arguments

mrs_data MRS data.

xlim range of values to crop in the spectral dimension eg xlim = c(4, 0.2).

scale the units to use for the frequency scale, can be one of: "ppm", "hz" or "points".

Value

cropped mrs_data object.

48 crop_td_pts_end

crop_td_pts

Crop mrs_data object data points in the time-domain.

Description

Crop mrs_data object data points in the time-domain.

Usage

```
crop_td_pts(mrs_data, start = NULL, end = NULL)
```

Arguments

mrs_data MRS data.

start starting data point (defaults to 1).

end ending data point (defaults to the last saved point).

Value

cropped mrs_data object.

crop_td_pts_end

Crop mrs_data object data points at the end of the FID.

Description

Crop mrs_data object data points at the end of the FID.

Usage

```
crop_td_pts_end(mrs_data, pts)
```

Arguments

mrs_data MRS data.

pts number of points to remove from the end of the FID.

Value

cropped mrs_data object.

crop_td_pts_pot 49

crop_td_pts_pot	Crop mrs_data object data points in the time-domain rounding down
	to the next smallest power of two (pot). Data that already has a pot
	length will not be changed.

Description

Crop mrs_data object data points in the time-domain rounding down to the next smallest power of two (pot). Data that already has a pot length will not be changed.

Usage

```
crop_td_pts_pot(mrs_data)
```

Arguments

mrs_data MRS data.

Value

cropped mrs_data object.

crop_xy

Crop an MRSI dataset in the x-y direction

Description

Crop an MRSI dataset in the x-y direction

Usage

```
crop_xy(mrs_data, x_dim, y_dim)
```

Arguments

mrs_data MRS data object.

x_dim x dimension output length. y_dim y dimension output length.

Value

selected subset of MRS data.

50 decimate_mrs_fd

crossprod_3d	Compute the vector cross product between vectors x and y.
	Adapted from http://stackoverflow.com/questions/15162741/what-is-
	rs-crossproduct-function

Description

Compute the vector cross product between vectors x and y. Adapted from http://stackoverflow.com/questions/15162741/what is-rs-crossproduct-function

Usage

```
crossprod_3d(x, y)
```

Arguments

x vector of length 3. y vector of length 3.

Value

vector cross product of x and y.

decimate_mrs_fd Decimate an MRS signal to half the original sampling frequency by filtering in the frequency domain before down sampling.

Description

Decimate an MRS signal to half the original sampling frequency by filtering in the frequency domain before down sampling.

Usage

```
decimate_mrs_fd(mrs_data)
```

Arguments

mrs_data MRS data object.

Value

decimated data at half the original sampling frequency.

decimate_mrs_td 51

decimate_mrs_td	Decimate an MRS signal by filtering in the time domain before down-sampling.
-----------------	--

Description

Decimate an MRS signal by filtering in the time domain before downsampling.

Usage

```
decimate_mrs_td(mrs_data, q = 2, n = 4, ftype = "iir")
```

Arguments

mrs_data MRS data object.

q integer factor to downsample by (default = 2).

n filter order used in the downsampling.

ftype filter type, "iir" or "fir".

Value

decimated data.

deconv_mrs Deconvolve two MRS data objects.

Description

Deconvolve two MRS data objects.

Usage

```
deconv_mrs(mrs_data_a, mrs_data_b)
```

Arguments

mrs_data_a MRS data to be deconvolved.
mrs_data_b MRS data to be deconvolved.

Value

deconvolved data.

52 def_acq_paras

def_acq_paras Return (and optionally modify using the input arguments) a list of the default acquisition parameters.	def_acq_paras	
--	---------------	--

Description

Return (and optionally modify using the input arguments) a list of the default acquisition parameters.

Usage

```
def_acq_paras(
   ft = getOption("spant.def_ft"),
   fs = getOption("spant.def_fs"),
   N = getOption("spant.def_N"),
   ref = getOption("spant.def_ref"),
   nuc = getOption("spant.def_nuc")
)
```

Arguments

ft	specify the transmitter frequency in Hz.
fs	specify the sampling frequency in Hz.
N	specify the number of data points in the spectral dimension.
ref	specify the reference value for ppm scale.
nuc	specify the resonant nucleus.

Value

A list containing the following elements:

- ft transmitter frequency in Hz.
- fs sampling frequency in Hz.
- N number of data points in the spectral dimension.
- ref reference value for ppm scale.
- nuc resonant nucleus.

def_fs 53

 def_fs

Return the default sampling frequency in Hz.

Description

Return the default sampling frequency in Hz.

Usage

```
def_fs()
```

Value

sampling frequency in Hz.

 def_ft

Return the default transmitter frequency in Hz.

Description

Return the default transmitter frequency in Hz.

Usage

```
def_ft()
```

Value

transmitter frequency in Hz.

def_N

Return the default number of data points in the spectral dimension.

Description

Return the default number of data points in the spectral dimension.

Usage

def_N()

Value

number of data points in the spectral dimension.

54 dicom_reader

def_nuc

Return the default nucleus.

Description

Return the default nucleus.

Usage

```
def_nuc()
```

Value

number of data points in the spectral dimension.

def_ref

Return the default reference value for ppm scale.

Description

Return the default reference value for ppm scale.

Usage

```
def_ref()
```

Value

reference value for ppm scale.

dicom_reader

A very simple DICOM reader.

Description

Note this reader is very basic and does not use a DICOM dictionary or try to convert the data to the correct datatype. For a more robust and sophisticated reader use the oro.dicom package.

Usage

```
dicom_reader(
  input,
  tags = list(sop_class_uid = "0008,0016"),
  endian = "little",
  debug = FALSE
)
```

diff_mrs 55

Arguments

input either a file path or raw binary object.

tags a named list of tags to be extracted from the file. eg tags <- list(spec_data =

"7FE1,1010", pat_name = "0010,0010")

endian can be "little" or "big".

debug print out some debugging information, can be "little" or "big".

Value

a list with the same structure as the input, but with tag codes replaced with the corresponding data in a raw format.

diff_mrs Apply the diff operator to an MRS dataset in the FID/spectral dimension.

Description

Apply the diff operator to an MRS dataset in the FID/spectral dimension.

Usage

```
diff_mrs(mrs_data, ...)
```

Arguments

mrs_data MRS data.

... additional arguments to the diff function.

Value

MRS data following diff operator.

56 downsample_mrs_td

downsample_mrs_fd

Downsample an MRS signal by a factor of 2 using an FFT "brick-wall" filter.

Description

Downsample an MRS signal by a factor of 2 using an FFT "brick-wall" filter.

Usage

```
downsample_mrs_fd(mrs_data)
```

Arguments

mrs_data

MRS data object.

Value

downsampled data.

downsample_mrs_td

Downsample an MRS signal by a factor of 2 by removing every other data point in the time-domain. Note, signals outside the new sampling frequency will be aliased.

Description

Downsample an MRS signal by a factor of 2 by removing every other data point in the time-domain. Note, signals outside the new sampling frequency will be aliased.

Usage

```
downsample_mrs_td(mrs_data)
```

Arguments

mrs_data

MRS data object.

Value

downsampled data.

dyn_acq_times 57

dyn_acq_times	Return a time scale vector of acquisition times for a dynamic MRS scan. The first temporal scan is assigned a value of 0.

Description

Return a time scale vector of acquisition times for a dynamic MRS scan. The first temporal scan is assigned a value of 0.

Usage

```
dyn_acq_times(mrs_data = NULL, tr = NULL, Ndyns = NULL, Ntrans = NULL)
```

Arguments

mrs_data MRS data.
tr repetition time.

Ndyns number of dynamic scans stored, potentially less than Ntrans if block averaging

has been performed.

Ntrans number of dynamic scans acquired.

Value

time scale vector in units of seconds.

ecc	Eddy current correction.

Description

Apply eddy current correction using the Klose method.

Usage

```
ecc(metab, ref, rev = FALSE)
```

Arguments

metab MRS data to be corrected.

ref reference dataset.

rev reverse the correction.

58 elliptical_mask

Details

In vivo proton spectroscopy in presence of eddy currents. Klose U. Magn Reson Med. 1990 Apr;14(1):26-30.

Value

corrected data in the time domain.

elliptical_mask

Create an elliptical mask stored as a matrix of logical values.

Description

Create an elliptical mask stored as a matrix of logical values.

Usage

```
elliptical_mask(xN, yN, x0, y0, xr, yr, angle)
```

Arguments

xN	number of pixels in the x dimension.
yN	number of pixels in the y dimension.
x0	centre of ellipse in the x direction in units of pixels.
y0	centre of ellipse in the y direction in units of pixels.
xr	radius in the x direction in units of pixels.
yr	radius in the y direction in units of pixels.
angle	angle of rotation in degrees.

Value

logical mask matrix with dimensions fov_yN x fov_xN.

est_noise_sd 59

est_noise_sd	Estimate the standard deviation of the noise from a segment of an mrs_data object.

Description

Estimate the standard deviation of the noise from a segment of an mrs_data object.

Usage

```
est_noise_sd(mrs_data, n = 100, offset = 100, p_order = 2)
```

Arguments

mrs_data MRS data object.

n number of data points (taken from the end of array) to use in the estimation.

offset number of final points to exclude from the calculation.

p_order polynomial order to fit to the data before estimating the standard deviation.

Value

standard deviation array.

fd2td

Transform frequency-domain data to the time-domain.

Description

Transform frequency-domain data to the time-domain.

Usage

```
fd2td(mrs_data)
```

Arguments

mrs_data

MRS data in frequency-domain representation.

Value

MRS data in time-domain representation.

fd_gauss_smo

C 1		C . 1	
+ 1	_conv_	+ 1	+
ı u_	_COIIV_	_	··

Frequency-domain convolution based filter.

Description

Frequency-domain convolution based filter.

Usage

```
fd_conv_filt(mrs_data, K = 25, ext = 1)
```

Arguments

mrs_data MRS data to be filtered.

K window width in data points.

ext point separation for linear extrapolation.

fd_gauss_smo

Apply a Gaussian smoother in the spectral domain.

Description

Apply a Gaussian smoother in the spectral domain.

Usage

```
fd_gauss_smo(mrs_data, smo_ppm_sd)
```

Arguments

 $mrs_data \qquad mrs_data \ object.$

smo_ppm_sd Gaussian smoother sd in ppm units.

Value

spectrally smoothed data.

find_bids_mrs 61

find_bids_mrs

Search for MRS data files in a BIDS filesystem structure.

Description

Search for MRS data files in a BIDS filesystem structure.

Usage

```
find_bids_mrs(path, output_full_path = FALSE)
```

Arguments

```
path path to the directory containing the BIDS structure.

output_full_path

output the full normalised data paths.
```

Value

data frame containing full paths and information on each MRS file.

find_mrs_files

Find valid MRS data files recursively from a directory path.

Description

Find valid MRS data files recursively from a directory path.

Usage

```
find_mrs_files(dir)
```

Arguments

dir

a directory path.

Value

a vector of valid MRS data files.

fit_diags

fit_amps

Extract the fit amplitudes from an object of class fit_result.

Description

Extract the fit amplitudes from an object of class fit_result.

Usage

```
fit_amps(
    x,
    inc_index = FALSE,
    sort_names = FALSE,
    append_common_1h_comb = TRUE
)
```

Arguments

```
x fit_result object.
inc_index include columns for the voxel index.
sort_names sort the basis set names alphabetically.
append_common_1h_comb
```

append commonly used 1H metabolite combinations eg tNAA = NAA + NAAG.

Value

a dataframe of amplitudes.

fit_diags

Calculate diagnostic information for object of class fit_result.

Description

Calculate diagnostic information for object of class fit_result.

Usage

```
fit_diags(x, amps = NULL)
```

Arguments

```
x fit_result object.
amps known metabolite amplitudes.
```

Value

a dataframe of diagnostic information.

fit_mrs 63

 fit_mrs

Perform a fit based analysis of MRS data.

Description

Note that TARQUIN and LCModel require these packages to be installed, and the functions set_tqn_cmd and set_lcm_cmd (respectively) need to be used to specify the location of these software packages.

Usage

```
fit_mrs(
  metab,
  basis = NULL,
  method = "ABFIT",
  w_ref = NULL,
  opts = NULL,
  parallel = FALSE,
  cl = NULL,
  time = TRUE,
  progress = "text",
  extra = NULL
)
```

Arguments

metab	metabolite data.
basis	basis class object or character vector to basis file in LCModel .basis format.
method	'ABFIT' (default), 'VARPRO', 'VARPRO_3P', 'TARQUIN' or 'LCMODEL'.
w_ref	water reference data for concentration scaling (optional).
opts	options to pass to the analysis method.
parallel	perform analyses in parallel (TRUE or FALSE).
cl	a parallel socket cluster required to run analyses in parallel. Eg, $cl <- parallel::makeCluster(4)$.
time	measure the time taken for the analysis to complete (TRUE or FALSE).
progress	option is passed to plyr::alply function to display a progress bar during fitting. Default value is "text", set to "none" to disable.
extra	an optional data frame to provide additional variables for use in subsequent analysis steps, eg id or grouping variables.

Details

Fitting approaches described in the following references: ABfit Wilson, M. Adaptive baseline fitting for 1H MR spectroscopy analysis. Magn Reson Med 2012;85:13-29.

64 fit_res2csv

VARPRO van der Veen JW, de Beer R, Luyten PR, van Ormondt D. Accurate quantification of in vivo 31P NMR signals using the variable projection method and prior knowledge. Magn Reson Med 1988;6:92-98.

TARQUIN Wilson, M., Reynolds, G., Kauppinen, R. A., Arvanitis, T. N. & Peet, A. C. A constrained least-squares approach to the automated quantitation of in vivo 1H magnetic resonance spectroscopy data. Magn Reson Med 2011;65:1-12.

LCModel Provencher SW. Estimation of metabolite concentrations from localized in vivo proton NMR spectra. Magn Reson Med 1993;30:672-679.

Value

MRS analysis object.

Examples

```
fname <- system.file("extdata", "philips_spar_sdat_WS.SDAT", package =
"spant")
svs <- read_mrs(fname)
## Not run:
basis <- sim_basis_1h_brain_press(svs)
fit_result <- fit_mrs(svs, basis)
## End(Not run)</pre>
```

fit_res2csv

Write fit results table to a csv file.

Description

Write fit results table to a csv file.

Usage

```
fit_res2csv(fit_res, fname, unscaled = FALSE)
```

Arguments

fit_res fit result object.

fname filename of csv file.

unscaled output the unscaled result table (default = FALSE).

fit_svs 65

fit_svs

Standard SVS 1H brain analysis pipeline.

Description

Note this function is still under development and liable to changes.

Usage

```
fit_svs(
 metab,
 w_ref = NULL,
  output_dir = NULL,
  external_basis = NULL,
  p_vols = NULL,
  format = NULL,
  pul_seq = NULL,
  TE = NULL,
 TR = NULL,
 TE1 = NULL,
 TE2 = NULL,
  TE3 = NULL,
  TM = NULL,
  append_basis = NULL,
  remove_basis = NULL,
  pre_align = TRUE,
  dfp\_corr = TRUE,
  output_ratio = "tCr",
  ecc = FALSE,
  hsvd_width = NULL,
  fit_opts = NULL,
  fit_subset = NULL,
  legacy_ws = FALSE,
 w_att = 0.7,
 w_{conc} = 35880,
  use_basis_cache = "auto",
  summary_measures = NULL,
  dyn_av_block_size = NULL,
  dyn_av_scheme = NULL,
  verbose = FALSE
)
```

Arguments

```
metab path or mrs_data object containing MRS metabolite data.

w_ref path or mrs_data object containing MRS water reference data.
```

66 fit_svs

output_dir directory path to output fitting results.

external_basis precompiled basis set object to use for analysis.

p_vols a numeric vector of partial volumes expressed as percentages. Defaults to 100%

white matter. A voxel containing 100% gray matter tissue would use : p_vols =

c(WM = 0, GM = 100, CSF = 0).

format Override automatic data format detection. See format argument in read_mrs()

for permitted values.

pul_seq Pulse sequence to use for basis simulation. Can be one of the following values

: "press", "press_ideal", "press_shaped", "steam" or "slaser". If "press" then "press_ideal" will be assumed unless the magnetic field is stronger that 2.8 Tesla,

"press_shaped" will be assumed for 2.9 Tesla and above.

TE metabolite mrs data echo time in seconds. If not supplied this will be guessed

from the metab data file.

TR metabolite mrs data repetition time in seconds. If not supplied this will be

guessed from the metab data file.

TE1 PRESS or sLASER sequence timing parameter in seconds.

TE2 PRESS or sLASER sequence timing parameter in seconds.

TE3 sLASER sequence timing parameter in seconds.

TM STEAM mixing time parameter in seconds.

append_basis names of extra signals to add to the default basis. Eg append_basis = c("peth",

"cit"). Cannot be used with precompiled basis sets.

remove_basis grep expression to match names of signals to remove from the basis. For ex-

ample: use "*" to remove all signals, "^mm|^lip" to remove all macromolecular and lipid signals, "^lac" to remove lactate. This operation is performed before signals are added with append_basis. Cannot be used with precompiled basis

sets.

pre_align perform simple frequency alignment to known reference peaks.

dfp_corr perform dynamic frequency and phase correction using the RATS method.

output_ratio optional string to specify a metabolite ratio to output. Defaults to "tCr" and

multiple metabolites may be specified for multiple outputs. Set as NULL to

omit.

ecc option to perform water reference based eddy current correction, defaults to

FALSE.

hsvd_width set the width of the HSVD filter in Hz. Note the applied width is between -

width and +width Hz, with 0 Hz being defined at the centre of the spectral width.

Default is disabled (set to NULL), 30 Hz is a reasonable value.

fit_opts options to pass to ABfit.

fit_subset specify a subset of dynamics to analyse, for example 1:16 would only fit the first

16 dynamic scans.

legacy_ws perform and output legacy water scaling compatible with default LCModel and

TARQUIN behaviour. See w_att and w_conc arguments to change the default

assumptions. Default value is FALSE.

fit_svs_gui 67

 w_{att} water attenuation factor (default = 0.7) for legacy water scaling. Assumes water

T2 of 80ms and a TE = 30 ms. $exp(-30ms / 80ms) \sim 0.7$.

w_conc assumed water concentration (default = 35880) for legacy water scaling. Default

value corresponds to typical white matter. Set to 43300 for gray matter, and

55556 for phantom measurements.

use_basis_cache

Pre-cache basis sets to reduce analysis speed. Can be one of the following: "auto", "all" or "none". The default value of "auto" will only use the cache for 3T PRESS - which generally requires more detailed simulation due to high CSD.

summary_measures

output an additional table with a subset of metabolite levels, eg c("tNAA", "tNAA/tCr", "tNAA/tCho", "Lac/tNAA").

dyn_av_block_size

perform temporal averaging with the specified block size. Defaults to NULL, eg

average across all dynamic scans.

dyn_av_scheme a numerical vector of sequential integers starting at 1, with the same length as

the number of dynamic scans in the metabolite data. For example: c(1, 1, 2, 1,

1, 3, 1, 1).

verbose output potentially useful information.

Examples

fit_svs_gui

GUI interface for the standard SVS 1H brain analysis pipeline, this is a work in progress, and not ready for serious use.

Description

GUI interface for the standard SVS 1H brain analysis pipeline, this is a work in progress, and not ready for serious use.

Usage

```
fit_svs_gui()
```

fit_t1_tr_array

fit_t1_ti_array

Fit a T1 recovery curve, from multiple TIs, to a set of amplitudes.

Description

Fit a T1 recovery curve, from multiple TIs, to a set of amplitudes.

Usage

```
fit_t1_ti_array(
   ti_vec,
   amp_vec,
   lower = 0,
   upper = 10,
   output_fit_res = 0.01,
   ret_full = TRUE
)
```

Arguments

```
ti_vec vector of TI values in seconds.

amp_vec vector of amplitudes.

lower minimum allowable T1 value.

upper maximum allowable T1 value.

output_fit_res temporal resolution (seconds) of the ideal output relaxation curve.

ret_full return full fitting information including ideal relaxation curve.
```

Value

a list containing relaxation parameters and an ideal curve for fit evaluation.

fit_t1_tr_array

Fit a T1 recovery curve, from multiple TRs, to a set of amplitudes.

Description

Fit a T1 recovery curve, from multiple TRs, to a set of amplitudes.

fit_t2_te_array 69

Usage

```
fit_t1_tr_array(
   tr_vec,
   amp_vec,
   lower = 0,
   upper = 10,
   output_fit_res = 0.01,
   ret_full = TRUE
)
```

Arguments

```
tr_vec vector of TR values in seconds.

amp_vec vector of amplitudes.

lower minimum allowable T1 value.

upper maximum allowable T1 value.

output_fit_res temporal resolution (seconds) of the ideal output relaxation curve.

ret_full return full fitting information including ideal relaxation curve.
```

Value

a list containing relaxation parameters and an ideal curve for fit evaluation.

fit_t2_te_array

Fit a T2 relaxation curve, from multiple TEs, to a set of amplitudes.

Description

Fit a T2 relaxation curve, from multiple TEs, to a set of amplitudes.

Usage

```
fit_t2_te_array(
   te_vec,
   amp_vec,
   lower = 0,
   upper = 10,
   output_fit_res = 0.01,
   ret_full = TRUE
)
```

70 fp_phase_correct

Arguments

te_vec vector of TE values in seconds.

amp_vec vector of amplitudes.

lower minimum allowable T2 value.
upper maximum allowable T2 value.

output_fit_res temporal resolution (seconds) of the ideal output relaxation curve.

ret_full return full fitting information including ideal relaxation curve.

Value

a list containing relaxation parameters and an ideal curve for fit evaluation.

fp_phase

Return the phase of the first data point in the time-domain.

Description

Return the phase of the first data point in the time-domain.

Usage

```
fp_phase(mrs_data)
```

Arguments

mrs_data MRS data.

Value

phase values in degrees.

fp_phase_correct

Perform a zeroth order phase correction based on the phase of the first data point in the time-domain.

Description

Perform a zeroth order phase correction based on the phase of the first data point in the time-domain.

Usage

```
fp_phase_correct(mrs_data, ret_phase = FALSE)
```

fp_scale 71

Arguments

mrs_data MRS data to be corrected.
ret_phase return phase values (logical).

Value

corrected data or a list with corrected data and optional phase values.

fp_scale

Scale the first time-domain data point in an mrs_data object.

Description

Scale the first time-domain data point in an mrs_data object.

Usage

```
fp_scale(mrs_data, scale = 0.5)
```

Arguments

mrs_data MRS data.

scale scaling value, defaults to 0.5.

Value

scaled mrs_data object.

fs

Return the sampling frequency in Hz of an MRS dataset.

Description

Return the sampling frequency in Hz of an MRS dataset.

Usage

```
fs(mrs_data)
```

Arguments

mrs_data MRS data.

Value

sampling frequency in Hz.

72 ft_shift

ft_dyns

Apply the Fourier transform over the dynamic dimension.

Description

Apply the Fourier transform over the dynamic dimension.

Usage

```
ft_dyns(mrs_data, ft_shift = FALSE, ret_mod = FALSE, fd = TRUE)
```

Arguments

mrs_data MRS data where the dynamic dimension is in the time-domain.

ft_shift apply FT shift to the output, default is FALSE.

ret_mod return the modulus out the transform, default is FALSE.

fd transform the chemical shift axis to the frequency domain first, default is TRUE.

Value

transformed MRS data.

ft_shift

Perform a fft and ffshift on a vector.

Description

Perform a fft and ffshift on a vector.

Usage

```
ft_shift(vec_in)
```

Arguments

vec_in

vector input.

Value

output vector.

ft_shift_mat 73

ft_shift_mat	Perform a fft and fftshift on a matrix with each column replaced by its shifted fft.

Description

Perform a fft and fftshift on a matrix with each column replaced by its shifted fft.

Usage

```
ft_shift_mat(mat_in)
```

Arguments

mat_in matrix input.

Value

output matrix.

gausswin_2d	Create a two dimensional Gaussian window function stored as a matrix.
-------------	---

Description

Create a two dimensional Gaussian window function stored as a matrix.

Usage

```
gausswin_2d(xN, yN, x0, y0, xw, yw)
```

Arguments

XN	number of pixels in the x dimension.
yN	number of pixels in the y dimension.
x0	centre of window function in the x direction in units of pixels. Note, only integer values are applied.
y0	centre of window function in the y direction in units of pixels. Note, only integer values are applied.
XW	the reciprocal of the standard deviation of the Gaussian window in x direction.
yw	the reciprocal of the standard deviation of the Gaussian window in y direction.

Value

matrix with dimensions fov_yN x fov_xN.

74 gen_bold_reg

gen_baseline_reg

Generate baseline regressor.

Description

Generate baseline regressor.

Usage

```
gen_baseline_reg(mrs_data = NULL, tr = NULL, Ndyns = NULL, Ntrans = NULL)
```

Arguments

mrs_data mrs_data object for timing information.

tr repetition time.

Ndyns number of dynamic scans stored, potentially less than Ntrans if block averaging

has been performed.

Ntrans number of dynamic scans acquired.

Value

a single baseline regressor with value of 1.

gen_bold_reg

Generate BOLD regressors.

Description

Generate BOLD regressors.

Usage

```
gen_bold_reg(
  onset,
  duration = NULL,
  trial_type = NULL,
  mrs_data = NULL,
  tr = NULL,
  Ndyns = NULL,
  Ntrans = NULL,
  match_tr = TRUE,
  dt = 0.1,
  normalise = FALSE
)
```

gen_conv_reg 75

Arguments

onset stimulus onset in seconds.

duration stimulus duration in seconds.

trial_type string label for the stimulus.

mrs_data object for timing information.

tr repetition time.

Ndyns number of dynamic scans stored, potentially less than Ntrans if block averaging

has been performed.

Ntrans number of dynamic scans acquired.

match_tr match the output to the input mrs_data.

dt timing resolution for internal calculations.

normalise normalise the response function to have a maximum value of one.

Value

BOLD regressor data frame.

gen_conv_reg Generate regressors by convolving a specified response function with a stimulus.

Description

Generate regressors by convolving a specified response function with a stimulus.

Usage

```
gen_conv_reg(
  onset,
  duration = NULL,
  trial_type = NULL,
  mrs_data = NULL,
  tr = NULL,
  Ndyns = NULL,
  Ntrans = NULL,
  resp_fn,
  match_tr = TRUE,
  normalise = FALSE
)
```

76 gen_F

Arguments

onset stimulus onset in seconds.

duration stimulus duration in seconds.

trial_type string label for the stimulus.

mrs_data object for timing information.

tr repetition time.

Ndyns number of dynamic scans stored, potentially less than Ntrans if block averaging

has been performed.

Ntrans number of dynamic scans acquired.

resp_fn a data frame specifying the response function to be convolved.

match_tr match the output to the input mrs_data.

normalise normalise the response function to have a maximum value of one.

Value

BOLD regressor data frame.

gen_F Generate the F product operator.

Description

Generate the F product operator.

Usage

```
gen_F(sys, op, detect = NULL)
```

Arguments

sys spin system object.

op operator, one of "x", "y", "z", "p", "m".

detect detection nuclei.

Value

F product operator matrix.

 gen_F_xy 77

gen_F_xy

Generate the Fxy product operator with a specified phase.

Description

Generate the Fxy product operator with a specified phase.

Usage

```
gen_F_xy(sys, phase, detect = NULL)
```

Arguments

sys spin system object.

phase phase angle in degrees.

detect detection nuclei.

Value

product operator matrix.

gen_group_reg

Expand a regressor matrix for a group analysis.

Description

Expand a regressor matrix for a group analysis.

Usage

```
gen_group_reg(regressor_df, n)
```

Arguments

regressor_df input regressor data frame.

n number of datasets n the group.

78 gen_impulse_reg

gen_I

Generate the I product operator for a single spin.

Description

Generate the I product operator for a single spin.

Usage

```
gen_I(n, spin_num, op)
```

Arguments

```
n spin index number for the required operator.
spin_num vector of spin numbers in the system.
op operator, one of "x", "y", "z", "p", "m".
```

Value

I product operator matrix.

gen_impulse_reg

Generate impulse regressors.

Description

Generate impulse regressors.

Usage

```
gen_impulse_reg(
  onset,
  trial_type = NULL,
  mrs_data = NULL,
  tr = NULL,
  Ndyns = NULL,
  Ntrans = NULL
)
```

gen_poly_reg 79

Arguments

onset stimulus onset in seconds.
trial_type string label for the stimulus.

mrs_data object for timing information.

tr repetition time.

Ndyns number of dynamic scans stored, potentially less than Ntrans if block averaging

has been performed.

Ntrans number of dynamic scans acquired.

Value

impulse regressors data frame.

gen_poly_reg Generate polynomial regressors.

Description

Generate polynomial regressors.

Usage

```
gen_poly_reg(degree, mrs_data = NULL, tr = NULL, Ndyns = NULL, Ntrans = NULL)
```

Arguments

degree the degree of the polynomial.

mrs_data mrs_data object for timing information.

tr repetition time.

Ndyns number of dynamic scans stored, potentially less than Ntrans if block averaging

has been performed.

Ntrans number of dynamic scans acquired.

Value

polynomial regressors.

gen_trap_reg

gen_trap_reg

Generate trapezoidal regressors.

Description

Generate trapezoidal regressors.

Usage

```
gen_trap_reg(
  onset,
  duration,
  trial_type = NULL,
  mrs_data = NULL,
  tr = NULL,
  Ndyns = NULL,
  Ntrans = NULL,
  rise_t = 0,
  fall_t = 0,
  exp_fall = FALSE,
  exp_fall_power = 1,
  smo_sigma = NULL,
 match_tr = TRUE,
  dt = 0.01,
  normalise = FALSE
)
```

Arguments

onset stimulus onset in seconds. duration stimulus duration in seconds. trial_type string label for the stimulus. mrs_data object for timing information. mrs_data repetition time. tr Ndyns number of dynamic scans stored, potentially less than Ntrans if block averaging has been performed. Ntrans number of dynamic scans acquired. time to reach a plateau from baseline in seconds. rise_t time to fall from plateau level back to baseline in seconds. fall_t exp_fall model an exponential fall instead of linear. exp_fall_power exponential fall power. standard deviation of Gaussian smoothing kernel in seconds. Set to NULL to smo_sigma

disable (default behavior).

match_tr match the output to the input mrs_data.

dt timing resolution for internal calculations.

normalise normalise the response function to have a maximum value of one.

Value

trapezoidal regressor data frame.

```
get_1h_braino_basis_names
```

Return a character vector of molecules included in the GE BRAINO phantom.

Description

Return a character vector of molecules included in the GE BRAINO phantom.

Usage

```
get_1h_braino_basis_names()
```

Value

a character vector of molecule names.

```
get_1h_brain_basis_names
```

Return a character vector of common 1H molecules found in healthy human brain.

Description

Note, this is a basic set and it may be appropriate to also include Asc, Gly and PEth for high quality MRS data.

Usage

```
get_1h_brain_basis_names(add = NULL, remove = NULL, inc_lip_mm = TRUE)
```

Arguments

add optional character vector of additional molecular names. Eg c("asc", "gly",

"peth").

remove optional character vector of molecular names to remove from the set. Eg c("m_cr_ch2").

inc_lip_mm include Lipid and MM basis signals.

Value

a character vector of molecule names.

```
get_1h_brain_basis_paras
```

Return a list of mol_parameter objects suitable for 1H brain MRS analyses.

Description

Return a list of mol_parameter objects suitable for 1H brain MRS analyses.

Usage

```
get_1h_brain_basis_paras(ft, metab_lw = NULL, lcm_compat = FALSE)
```

Arguments

ft transmitter frequency in Hz.

metab_lw linewidth of metabolite signals (Hz).

1cm_compat when TRUE, lipid, MM and -CrCH molecules will be excluded from the output.

Value

list of mol_parameter objects.

```
get_1h_brain_basis_paras_v1
```

 $Return\ a\ list\ of\ mol_parameter\ objects\ suitable\ for\ 1H\ brain\ MRS\ analyses.$

Description

Return a list of mol_parameter objects suitable for 1H brain MRS analyses.

Usage

```
get_1h_brain_basis_paras_v1(ft, metab_lw = NULL, lcm_compat = FALSE)
```

Arguments

ft transmitter frequency in Hz.

metab_lw linewidth of metabolite signals (Hz).

1cm_compat when TRUE, lipid, MM and -CrCH molecules will be excluded from the output.

Value

list of mol_parameter objects.

```
get_1h_brain_basis_paras_v2
```

Return a list of mol_parameter objects suitable for 1H brain MRS analyses.

Description

Return a list of mol_parameter objects suitable for 1H brain MRS analyses.

Usage

```
get_1h_brain_basis_paras_v2(ft, metab_lw = NULL, lcm_compat = FALSE)
```

Arguments

ft transmitter frequency in Hz.

metab_lw linewidth of metabolite signals (Hz).

1cm_compat when TRUE, lipid, MM and -CrCH molecules will be excluded from the output.

Value

list of mol_parameter objects.

```
get_1h_brain_basis_paras_v3
```

Return a list of mol_parameter objects suitable for 1H brain MRS analyses.

Description

Return a list of mol_parameter objects suitable for 1H brain MRS analyses.

Usage

```
get_1h_brain_basis_paras_v3(ft, metab_lw = NULL, lcm_compat = FALSE)
```

Arguments

ft transmitter frequency in Hz.

metab_lw linewidth of metabolite signals (Hz).

1cm_compat when TRUE, lipid, MM and -CrCH molecules will be excluded from the output.

get_2d_psf

Value

list of mol_parameter objects.

```
get_1h_spectre_basis_names
```

Return a character vector of molecules included in the Gold Star Phantoms SPECTRE phantom.

Description

Return a character vector of molecules included in the Gold Star Phantoms SPECTRE phantom.

Usage

```
get_1h_spectre_basis_names()
```

Value

a character vector of molecule names.

get_2d_psf

Get the point spread function (PSF) for a 2D phase encoded MRSI scan.

Description

Get the point spread function (PSF) for a 2D phase encoded MRSI scan.

Usage

```
get_2d_psf(
  FOV = 160,
  mat_size = 16,
  sampling = "circ",
  hamming = FALSE,
  ensure_odd = TRUE
)
```

Arguments

FOV field of view in mm.

mat_size acquisition matrix size (not interpolated).

sampling can be either "circ" for circular or "rect" for rectangular.

hamming should Hamming k-space weighting be applied (default FALSE).

ensure_odd add 1mm to the FOV when required to ensure the output pdf has odd dimensions.

Required when using get_mrsi2d_seg.

get_acq_paras 85

Value

A matrix of the PSF with 1mm resolution.

get_acq_paras

Return acquisition parameters from a MRS data object.

Description

Return acquisition parameters from a MRS data object.

Usage

```
get_acq_paras(mrs_data)
```

Arguments

mrs_data

MRS data.

Value

list of acquisition parameters.

get_basis_subset

Return a subset of the input basis.

Description

Return a subset of the input basis.

Usage

```
get_basis_subset(basis, names, invert = FALSE)
```

Arguments

basis input basis.

names basis set elements to keep in the returned object.

invert set to true to return all basis elements except those given in the names argument.

Value

a subset of the input basis.

86 get_even_dyns

get_dyns

Extract a subset of dynamic scans.

Description

Extract a subset of dynamic scans.

Usage

```
get_dyns(mrs_data, subset)
```

Arguments

mrs_data

dynamic MRS data.

subset

vector containing indices to the dynamic scans to be returned.

Value

MRS data containing the subset of requested dynamics.

get_even_dyns

Return even numbered dynamic scans starting from 1 (2,4,6...).

Description

Return even numbered dynamic scans starting from 1 (2,4,6...).

Usage

```
get_even_dyns(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

dynamic MRS data containing even numbered scans.

get_fh_dyns 87

get_fh_dyns

Return the first half of a dynamic series.

Description

Return the first half of a dynamic series.

Usage

```
get_fh_dyns(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

first half of the dynamic series.

get_fit_map

Get a data array from a fit result.

Description

Get a data array from a fit result.

Usage

```
get_fit_map(fit_res, name)
```

Arguments

fit_res fit_result object.

name of the quantity to plot, eg "tNAA".

88 get_guassian_pulse

get_fp

Return the first time-domain data point.

Description

Return the first time-domain data point.

Usage

```
get_fp(mrs_data)
```

Arguments

 ${\tt mrs_data}$

MRS data.

Value

first time-domain data point.

get_guassian_pulse

Generate a gaussian pulse shape.

Description

Generate a gaussian pulse shape.

Usage

```
get_guassian_pulse(angle, n, trunc = 1)
```

Arguments

angle pulse angle in degrees.

n number of points to generate.
trunc percentage truncation factor.

get_head_dyns 89

get	head	dvns

Return the first scans of a dynamic series.

Description

Return the first scans of a dynamic series.

Usage

```
get_head_dyns(mrs_data, n = 1)
```

Arguments

mrs_data

dynamic MRS data.

n

the number of dynamic scans to return.

Value

first scans of a dynamic series.

get_lcm_cmd

Print the command to run the LCModel command-line program.

Description

Print the command to run the LCModel command-line program.

Usage

```
get_lcm_cmd()
```

get_metab

Extract the metabolite component from an mrs_data object.

Description

Extract the metabolite component from an mrs_data object.

Usage

```
get_metab(mrs_data)
```

90 get_mol_paras

Arguments

mrs_data MRS data.

Value

metabolite component.

get_mol_names

Return a character array of names that may be used with the get_mol_paras function.

Description

Return a character array of names that may be used with the get_mol_paras function.

Usage

```
get_mol_names()
```

Value

a character array of names.

get_mol_paras

Get a mol_parameters object for a named molecule.

Description

Get a mol_parameters object for a named molecule.

Usage

```
get_mol_paras(name, ...)
```

Arguments

name the name of the molecule.

... arguments to pass to molecule definition function.

get_mrsi2d_seg 91

get_mrsi2d_seg	get_mrsi2d_seg	Calculate the partial volume estimates for each voxel in a 2D MRSI dataset.	
----------------	----------------	---	--

Description

Localisation is assumed to be perfect in the z direction and determined by the ker input in the x-y direction.

Usage

```
get_mrsi2d_seg(mrs_data, mri_seg, ker)
```

Arguments

mrs_data 2D MRSI data with multiple voxels in the x-y dimension.

mri_seg MRI data with values corresponding to the segmentation class. Must be 1mm

isotropic resolution.

ker MRSI PSF kernel in the x-y direction compatible with the mmand package, eg:

mmand::shapeKernel(c(10, 10), type = "box").

Value

a data frame of partial volume estimates and individual segmentation maps.

get_mrsi_voi	Generate a MRSI VOI from an mrs_data object.
--------------	--

Description

Generate a MRSI VOI from an mrs_data object.

Usage

```
get_mrsi_voi(mrs_data, target_mri = NULL, map = NULL, ker = mmand::boxKernel())
```

Arguments

mrs_data MRS data.

target_mri optional image data to match the intended volume space.

map optional voi intensity map.

ker kernel to rescale the map data to the target_mri. Default value is mmand::boxKernel(),

use mmand::mnKernel() for a smoothed map.

Value

volume data as a nifti object.

get_mrsi_voxel

Generate a MRSI voxel from an mrs_data object.

Description

Generate a MRSI voxel from an mrs_data object.

Usage

```
get_mrsi_voxel(mrs_data, target_mri, x_pos, y_pos, z_pos)
```

Arguments

mrs_data MRS data.

target_mri optional image data to match the intended volume space.

x_posy_posz_posz voxel coordinate.z voxel coordinate.

Value

volume data as a nifti object.

```
\verb|get_mrsi_voxel_xy_psf| \textit{ Generate a MRSI voxel PSF from an } \verb|mrs_data| \textit{ object}.
```

Description

Generate a MRSI voxel PSF from an mrs_data object.

Usage

```
get_mrsi_voxel_xy_psf(mrs_data, target_mri, x_pos, y_pos, z_pos)
```

Arguments

mrs_data MRS data.

target_mri optional image data to match the intended volume space.

x_posy_posz_posz voxel coordinate.z voxel coordinate.

Value

volume data as a nifti object.

get_mrs_affine 93

ant.	mrc	affine	
261	IIII S	arrine	

Generate an affine for nifti generation.

Description

Generate an affine for nifti generation.

Usage

```
get_mrs_affine(mrs_data, x_pos = 1, y_pos = 1, z_pos = 1)
```

Arguments

mrs_data	input data.
IIII J_aaca	mput uutu

x_posx_position coordinate.y_posy_position coordinate.z_posz_position coordinate.

Value

affine matrix.

get_odd_dyns

Return odd numbered dynamic scans starting from 1 (1,3,5...).

Description

Return odd numbered dynamic scans starting from 1 (1,3,5...).

Usage

```
get_odd_dyns(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

dynamic MRS data containing odd numbered scans.

94 get_seg_ind

get_ref

Extract the reference component from an mrs_data object.

Description

Extract the reference component from an mrs_data object.

Usage

```
get_ref(mrs_data)
```

Arguments

 ${\sf mrs_data}$

MRS data.

Value

reference component.

get_seg_ind

Get the indices of data points lying between two values (end > x >

start).

Description

Get the indices of data points lying between two values (end > x > start).

Usage

```
get_seg_ind(scale, start, end)
```

Arguments

scale full list of values.

start smallest value in the subset.
end largest value in the subset.

Value

set of indices.

get_sh_dyns 95

get_sh_dyns

Return the second half of a dynamic series.

Description

Return the second half of a dynamic series.

Usage

```
get_sh_dyns(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

second half of the dynamic series.

get_slice

Return a single slice from a larger MRSI dataset.

Description

Return a single slice from a larger MRSI dataset.

Usage

```
get_slice(mrs_data, z_pos)
```

Arguments

mrs_data

MRSI data.

z_pos

the z index to extract.

Value

MRS data.

96 get_subset

get_spin_num

Return the spin number for a given nucleus.

Description

Return the spin number for a given nucleus.

Usage

```
get_spin_num(nucleus)
```

Arguments

nucleus

nucleus name, eg "1H".

Value

spin number.

get_subset

Extract a subset of MRS data.

Description

Extract a subset of MRS data.

Usage

```
get_subset(
  mrs_data,
  x_set = NULL,
  y_set = NULL,
  z_set = NULL,
  dyn_set = NULL,
  coil_set = NULL,
  fd_set = NULL,
  td_set = NULL
)
```

get_svs_voi 97

Arguments

mrs_data	MRS data object.
x_set	x indices to include in the output (default all).
y_set	y indices to include in the output (default all).
z_set	z indices to include in the output (default all).
dyn_set	dynamic indices to include in the output (default all).
coil_set	coil indices to include in the output (default all).
fd_set	frequency domain data indices to include in the output (default all).
td_set	time-domain indices to include in the output (default all).

Value

selected subset of MRS data.

get_svs_voi	Generate a SVS acquisition volume from an mrs_data object.

Description

Generate a SVS acquisition volume from an mrs_data object.

Usage

```
get_svs_voi(mrs_data, target_mri)
```

Arguments

mrs_data MRS data.

target_mri optional image data to match the intended volume space.

Value

volume data as a nifti object.

98 get_td_amp

get	tail	dvns

Return the last scans of a dynamic series.

Description

Return the last scans of a dynamic series.

Usage

```
get_tail_dyns(mrs_data, n = 1)
```

Arguments

mrs_data dynamic MRS data.

n the number of dynamic scans to return.

Value

last scans of a dynamic series.

get_td_amp	Return an array of amplitudes derived from fitting the initial points in
	the time domain and extrapolating back to $t=0$.

Description

Return an array of amplitudes derived from fitting the initial points in the time domain and extrapolating back to t=0.

Usage

```
get_td_amp(mrs_data, nstart = 10, nend = 50, method = "poly")
```

Arguments

mrs_data MRS data.

nstart first data point to fit. nend last data point to fit.

method method for measuring the amplitude, one of "poly", spline" or exp".

Value

array of amplitudes.

get_tqn_cmd 99

get_	tan	_cmd
5 C L_	LUII	_ciliu

Print the command to run the TARQUIN command-line program.

Description

Print the command to run the TARQUIN command-line program.

Usage

```
get_tqn_cmd()
```

get_uncoupled_mol

 $Generate\ a\ mol_parameters\ object\ for\ a\ simple\ spin\ system\ with\ one\ resonance.$

Description

Generate a mol_parameters object for a simple spin system with one resonance.

Usage

```
get_uncoupled_mol(
  name,
  chem_shift,
  nucleus,
  scale_factor,
  lw,
  lg,
  full_name = NULL
)
```

Arguments

name abbreviated name of the molecule. chem_shift chemical shift of the resonance (PPM).

nucleus (1H, 31P...).

scale_factor multiplicative scaling factor. Note, this value can be made complex to adjust the

phase of the resonance.

lw linewidth in Hz.

lg Lorentz-Gauss lineshape parameter (between 0 and 1).

full_name long name of the molecule (optional).

Value

mol_parameters object.

100 get_voi_seg

get_voi_cog

Calculate the centre of gravity for an image containing 0 and 1's.

Description

Calculate the centre of gravity for an image containing 0 and 1's.

Usage

```
get_voi_cog(voi)
```

Arguments

voi

nifti object.

Value

triplet of x,y,z coordinates.

get_voi_seg

Return the white matter, gray matter and CSF composition of a volume.

Description

Return the white matter, gray matter and CSF composition of a volume.

Usage

```
get_voi_seg(voi, mri_seg)
```

Arguments

voi volume data as a nifti object.

mri_seg segmented brain volume as a nifti object.

Value

a vector of partial volumes expressed as percentages.

get_voi_seg_psf 101

get_voi_seg_psf	Return the white matter, gray matter and CSF composition of a volume.
o – – o -,	• • •

Description

Return the white matter, gray matter and CSF composition of a volume.

Usage

```
get_voi_seg_psf(psf, mri_seg)
```

Arguments

psf volume data as a nifti object.

mri_seg segmented brain volume as a nifti object.

Value

a vector of partial volumes expressed as percentages.

get_voxel

Return a single voxel from a larger mrs dataset.

Description

Return a single voxel from a larger mrs dataset.

Usage

```
get_voxel(mrs_data, x_pos = 1, y_pos = 1, z_pos = 1, dyn = 1, coil = 1)
```

Arguments

mrs_data	MRS data.
x_pos	the x index to plot.
y_pos	the y index to plot.
z_pos	the z index to plot.
dyn	the dynamic index to plot.
coil	the coil element number to plot.

Value

MRS data.

102 glm_spec_fmrs_fl

glm_spec

Perform a GLM analysis of dynamic MRS data in the spectral domain.

Description

Perform a GLM analysis of dynamic MRS data in the spectral domain.

Usage

```
glm_spec(mrs_data, regressor_df, full_output = FALSE)
```

Arguments

mrs_data single-voxel dynamics MRS data.

regressor_df a data frame containing temporal regressors to be applied to each spectral data-

point.

full_output append mrs_data and regressor_df to the output list.

Value

list of statistical results.

glm_spec_fmrs_fl

Perform first-level spectral GLM analysis of an fMRS dataset.

Description

Perform first-level spectral GLM analysis of an fMRS dataset.

Usage

```
glm_spec_fmrs_fl(
  regressor_df,
  analysis_dir = "spant_analysis",
  exclude_labels = NULL,
  labels = NULL,
  xlim = c(4, 0.2),
  vline = c(1.35, 1.28, 2.35, 2.29),
  return_results = FALSE
)
```

glm_spec_fmrs_group 103

Arguments

regressor_df a data frame containing temporal regressors to be applied to each spectral data-

point.

analysis_dir directory containing preprocessed data generated by the preproc_svs_dataset

function.

exclude_labels vector of labels of scans to exclude, eg poor quality data.

labels labels to describe each data set.

xlim spectral range to include in the analysis.

vline vertical lines to add to the plot.

return_results function will return key outputs, defaults to FALSE.

glm_spec_fmrs_group

Perform group-level spectral GLM analysis of an fMRS dataset.

Description

Perform group-level spectral GLM analysis of an fMRS dataset.

Usage

```
glm_spec_fmrs_group(
  regressor_df,
  analysis_dir = "spant_analysis",
  exclude_labels = NULL,
  labels = NULL
)
```

Arguments

regressor_df a data frame containing temporal regressors to be applied to each spectral data-

point.

analysis_dir directory containing preprocessed data generated by the preproc_svs_dataset

function.

exclude_labels vector of labels of scans to exclude, eg poor quality data.

labels labels to describe each data set.

104 gridplot

Description

Test a group-level spectral GLM linear hypothesis.

Usage

```
glm_spec_group_linhyp(hmat, analysis_dir = "spant_analysis")
```

Arguments

hmat linear hypothesis matrix.

analysis_dir directory containing preprocessed data generated by the preproc_svs_dataset

function.

gridplot

Arrange spectral plots in a grid.

Description

Arrange spectral plots in a grid.

Usage

```
gridplot(x, ...)
```

Arguments

x object for plotting.

... arguments to be passed to methods.

gridplot.mrs_data 105

 ${\tt gridplot.mrs_data}$

Arrange spectral plots in a grid.

Description

Arrange spectral plots in a grid.

Usage

```
## S3 method for class 'mrs_data'
gridplot(
    x,
    rows = NA,
    cols = NA,
    mar = c(0, 0, 0, 0),
    oma = c(3.5, 1, 1, 1),
    bty = "o",
    restore_def_par = TRUE,
    ...
)
```

Arguments

```
x object of class mrs_data.

rows number of grid rows.

cols number of grid columns.

mar option to adjust the plot margins. See ?par.

oma outer margin area.

bty option to draw a box around the plot. See ?par.

restore_def_par

restore default plotting par values after the plot has been made.

... other arguments to pass to the plot method.
```

grid_shift_xy

Grid shift MRSI data in the x/y dimension.

Description

Grid shift MRSI data in the x/y dimension.

Usage

```
grid_shift_xy(mrs_data, x_shift, y_shift)
```

106 hsvd

Arguments

mrs_data MRSI data in the spatial domain.

x_shift shift to apply in the x-direction in units of voxels.

y_shift shift to apply in the y-direction in units of voxels.

Value

shifted data.

hsvd

HSVD of an mrs_data object.

Description

HSVD method as described in: Barkhuijsen H, de Beer R, van Ormondt D. Improved algorithm for noniterative and timedomain model fitting to exponentially damped magnetic resonance signals. J Magn Reson 1987;73:553-557.

Usage

```
hsvd(mrs_data, comps = 40, irlba = TRUE, max_damp = 10)
```

Arguments

mrs_data object to be decomposed.

comps number of Lorentzian components to use for modelling.

irlba option to use irlba SVD (logical).

max_damp maximum allowable damping factor.

Value

basis matrix and signal table.

hsvd_filt 107

hsvd_filt

HSVD based signal filter.

Description

HSVD based signal filter described in: Barkhuijsen H, de Beer R, van Ormondt D. Improved algorithm for noniterative and timedomain model fitting to exponentially damped magnetic resonance signals. J Magn Reson 1987;73:553-557.

Usage

```
hsvd_filt(
  mrs_data,
  xlim = c(-30, 30),
  comps = 40,
  irlba = TRUE,
  max_damp = 10,
  scale = "hz",
  return_model = FALSE
)
```

Arguments

mrs_data	MRS data to be filtered.
xlim	frequency range to filter, default units are Hz which can be changed to ppm using the "scale" argument.
comps	number of Lorentzian components to use for modelling.
irlba	option to use irlba SVD (logical).
max_damp	maximum allowable damping factor.
scale	either "hz" or "ppm" to set the frequency units of xlim.
return_model	by default the filtered spectrum is returned. Set return_model to TRUE to return the HSVD model of the data.

Value

filtered data or model depending on the return_model argument.

108 hz

hsvd_vec

HSVD of a complex vector.

Description

HSVD method as described in: Barkhuijsen H, de Beer R, van Ormondt D. Improved algorithm for noniterative and timedomain model fitting to exponentially damped magnetic resonance signals. J Magn Reson 1987;73:553-557.

Usage

```
hsvd_vec(y, fs, comps = 40, irlba = TRUE, max_damp = 0)
```

Arguments

y time domain signal to be filtered as a vector.

fs sampling frequency of y.

comps number of Lorentzian components to use for modelling.

irlba option to use irlba SVD (logical).

max_damp maximum allowable damping factor. Default value of 0 ensures resultant model

is damped.

Value

basis matrix and signal table.

hz

Return the frequency scale of an MRS dataset in Hz.

Description

Return the frequency scale of an MRS dataset in Hz.

Usage

```
hz(mrs\_data, fs = NULL, N = NULL)
```

Arguments

mrs_data MRS data.

fs sampling frequency in Hz.

N number of data points in the spectral dimension.

Value

frequency scale.

ift_shift 109

ift_shift

Perform an iffshift and ifft on a vector.

Description

Perform an iffshift and ifft on a vector.

Usage

```
ift_shift(vec_in)
```

Arguments

vec_in

vector input.

Value

output vector.

 ift_shift_mat

Perform an ifft and ifftshift on a matrix with each column replaced by its shifted ifft.

Description

Perform an ifft and ifftshift on a matrix with each column replaced by its shifted ifft.

Usage

```
ift_shift_mat(mat_in)
```

Arguments

 ${\sf mat_in}$

matrix input.

Value

output matrix.

image.mrs_data

Im.mrs_data

Apply Im operator to an MRS dataset.

Description

Apply Im operator to an MRS dataset.

Usage

```
## S3 method for class 'mrs_data'
Im(z)
```

Arguments

z

MRS data.

Value

MRS data following Im operator.

image.mrs_data

Image plot method for objects of class mrs_data.

Description

Image plot method for objects of class mrs_data.

Usage

```
## S3 method for class 'mrs_data'
image(
 х,
 xlim = NULL,
 mode = "re",
 col = NULL,
 plot_dim = NULL,
 x_pos = NULL,
 y_pos = NULL,
  z_pos = NULL,
 dyn = 1,
  coil = 1,
  restore_def_par = TRUE,
 y_ticks = NULL,
 hline = NULL,
 hline_lty = 2,
 hline_col = "white",
```

image.mrs_data 111

```
vline = NULL,
vline_lty = 2,
vline_col = "white",
legend = FALSE,
...
)
```

Arguments

x object of class mrs_data.

xlim the range of values to display on the x-axis, eg xlim = c(4,1).

mode representation of the complex numbers to be plotted, can be one of: "re", "im",

"mod" or "arg".

col Colour map to use, defaults to viridis.

plot_dim the dimension to display on the y-axis, can be one of: "dyn", "time_sec", x",

"y", "z", "coil" or NULL. If NULL (the default) all spectra are collapsed into

the dynamic dimension and displayed.

x_pos the x index to plot.

y_pos the y index to plot.

z_pos the z index to plot.

dyn the dynamic index to plot.

coil the coil element number to plot.

restore_def_par

restore default plotting par values after the plot has been made.

y_ticks a vector of indices specifying where to place additional red tick marks.

hline add a horizontal line at the specified value.

hline_lty linetype for the horizontal line.

hline_col colour for the horizontal line.

vline add a vertical line at the specified value.

vline_lty linetype for the vertical line.

vline_col colour for the vertical line.

legend add a colour bar to the plot using the imagePlot function from the fields package.

... other arguments to pass to the plot method.

112 Imzap

img2kspace_xy

Transform 2D MRSI data to k-space in the x-y direction.

Description

Transform 2D MRSI data to k-space in the x-y direction.

Usage

```
img2kspace_xy(mrs_data)
```

Arguments

mrs_data

2D MRSI data.

Value

k-space data.

Imzap

Complex rounding function taken from complexplus package to reduce the number of spant dependencies.

Description

Complex rounding function taken from complexplus package to reduce the number of spant dependencies.

Usage

```
Imzap(x, tol = 1e-06)
```

Arguments

x a scalar or vector, real or complex.

tol a tolerance, 10^-6 by default. Prevents possible numerical problems. Can be set

to 0 if desired.

interleave_dyns 113

interleave_dyns

Interleave the first and second half of a dynamic series.

Description

Interleave the first and second half of a dynamic series.

Usage

```
interleave_dyns(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

interleaved data.

int_spec

Integrate a spectral region.

Description

See spec_op function for a more complete set of spectral operations.

Usage

```
int_spec(mrs_data, xlim = NULL, freq_scale = "ppm", mode = "re")
```

Arguments

mrs_data MRS data.

xlim spectral range to be integrated (defaults to full range).

freq_scale units of xlim, can be: "ppm", "hz" or "points".

mode spectral mode, can be: "re", "im", "mod" or "cplx".

Value

an array of integral values.

114 inv_odd_dyns

inv_even_dyns

Invert even numbered dynamic scans starting from 1 (2,4,6...).

Description

Invert even numbered dynamic scans starting from 1 (2,4,6...).

Usage

```
inv_even_dyns(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

dynamic MRS data with inverted even numbered scans.

 inv_odd_dyns

Invert odd numbered dynamic scans starting from 1 (1,3,5...).

Description

Invert odd numbered dynamic scans starting from 1 (1,3,5...).

Usage

```
inv_odd_dyns(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

dynamic MRS data with inverted odd numbered scans.

is.def

is.def

Check if an object is defined, which is the same as being not NULL.

Description

Check if an object is defined, which is the same as being not NULL.

Usage

```
is.def(x)
```

Arguments

Χ

object to test for being NULL.

Value

logical value.

is_fd

Check if the chemical shift dimension of an MRS data object is in the frequency domain.

Description

Check if the chemical shift dimension of an MRS data object is in the frequency domain.

Usage

```
is_fd(mrs_data)
```

Arguments

mrs_data

MRS data.

Value

logical value.

116 12_reg

kspace2img_xy

Transform 2D MRSI data from k-space to image space in the x-y direction.

Description

Transform 2D MRSI data from k-space to image space in the x-y direction.

Usage

```
kspace2img_xy(mrs_data)
```

Arguments

mrs_data

2D MRSI data.

Value

MRSI data in image space.

12_reg

Perform 12 regularisation artefact suppression.

Description

Perform 12 regularisation artefact suppression using the method proposed by Bilgic et al. JMRI 40(1):181-91 2014.

Usage

```
12_reg(
  mrs_data,
  thresh = 0.05,
  b = 1e-11,
  A = NA,
  xlim = NA,
  thresh_xlim = NULL,
  A_append = NULL,
  ret_norms = FALSE
)
```

Ib 117

Arguments

mrs_data	input data for artefact suppression.
thresh	threshold parameter to extract lipid signals from mrs_data based on the spectral integration of the thresh_xlim region in magnitude mode.
b	regularisation parameter.
A	set of spectra containing the artefact basis signals. The thresh parameter is ignored when A is specified.
xlim	spectral limits in ppm to restrict the reconstruction range. Defaults to the full spectral width.
thresh_xlim	spectral limits in ppm to integrate for the threshold map.
A_append	additional spectra to append to the A basis.
ret_norms	return the residual norm and solution norms.

Value

12 reconstructed mrs_data object.

1b

Apply line-broadening (apodisation) to MRS data or basis object.

Description

Apply line-broadening (apodisation) to MRS data or basis object.

Usage

```
lb(x, lb, lg = 1)

## S3 method for class 'list'
lb(x, lb, lg = 1)

## S3 method for class 'mrs_data'
lb(x, lb, lg = 1)

## S3 method for class 'basis_set'
lb(x, lb, lg = 1)
```

Arguments

x	input mrs_data or basis_set object.
1b	amount of line-broadening in Hz.
lg	Lorentz-Gauss lineshape parameter (between 0 and 1).

Value

line-broadened data.

118 lw2alpha

lofdc

Correct linear frequency drift.

Description

Correct linear frequency drift.

Usage

```
lofdc(
  mrs_data,
  max_hz_s = 0.1,
  tr = NULL,
  ret_corr_only = TRUE,
  outlier_thresh = 3,
  xlim = c(4, 0.5),
  order = 1
)
```

Arguments

mrs_data MRS data to be corrected.

max_hz_s the maximum drift rate to search over.

tr mrs_data repetition time.

ret_corr_only return the corrected mrs_data object only.

outlier_thresh threshold to remove outliers.

xlim spectral width (in ppm) to evaluate outliers.

order correction order.

Value

drift corrected mrs_data object.

lw2alpha

Covert a linewidth in Hz to an equivalent alpha value in the time-domain ie: x * exp(-t * alpha).

Description

Covert a linewidth in Hz to an equivalent alpha value in the time-domain ie: x * exp(-t * alpha).

Usage

```
lw2alpha(lw)
```

Iw2beta 119

Arguments

lw linewidth in Hz.

Value

beta damping value.

lw2beta

Covert a linewidth in Hz to an equivalent beta value in the time-domain ie: x * exp(-t * t * beta).

Description

Covert a linewidth in Hz to an equivalent beta value in the time-domain ie: x * exp(-t * t * beta).

Usage

lw2beta(lw)

Arguments

lw linewidth in Hz.

Value

beta damping value.

make_basis_from_raw

Make a basis-set object from a directory containing LCModel formatted RAW files.

Description

Make a basis-set object from a directory containing LCModel formatted RAW files.

Usage

```
make_basis_from_raw(dir_path, ft, fs, ref)
```

Arguments

dir_path path to the directory containing LCModel RAW files. One file per signal.

ft transmitter frequency in Hz.
fs sampling frequency in Hz.
ref reference value for ppm scale.

mask_fit_res

Value

a basis-set object.

mask_dyns

Mask an MRS dataset in the dynamic dimension.

Description

Mask an MRS dataset in the dynamic dimension.

Usage

```
mask_dyns(mrs_data, mask)
```

Arguments

mrs_data

MRS data object.

mask

vector of boolean values specifying the dynamics to mask, where a value of

TRUE indicates the spectrum should be removed.

Value

masked dataset.

mask_fit_res

Mask fit result spectra depending on a vector of bool values.

Description

Mask fit result spectra depending on a vector of bool values.

Usage

```
mask_fit_res(fit_result, mask_vec, amps_only = FALSE)
```

Arguments

fit_result fit result object to be masked.

mask_vec a Boolean vector with the same number of rows as there are rows in the results

table.

amps_only only mask the amplitude and associated error estimate columns.

Value

a masked fit result object.

mask_xy 121

mask_xy

Mask an MRSI dataset in the x-y direction

Description

Mask an MRSI dataset in the x-y direction

Usage

```
mask_xy(mrs_data, x_dim, y_dim)
```

Arguments

mrs_data MRS data object.

 x_dim $x dimension output length. <math>y_dim$ y dimension output length.

Value

masked MRS data.

mask_xy_corners

Mask the four corners of an MRSI dataset in the x-y plane.

Description

Mask the four corners of an MRSI dataset in the x-y plane.

Usage

```
mask_xy_corners(mrs_data)
```

Arguments

mrs_data

MRS data object.

Value

masked MRS data.

122 mask_xy_mat

 $mask_xy_ellipse$ $Mask\ the\ voxels\ outside\ an\ elliptical\ region\ spanning\ the\ MRSI\ dataset$ $in\ the\ x-y\ plane.$

Description

Mask the voxels outside an elliptical region spanning the MRSI dataset in the x-y plane.

Usage

```
mask_xy_ellipse(mrs_data)
```

Arguments

mrs_data

MRS data object.

Value

masked MRS data.

 ${\sf mask_xy_mat}$

Mask a 2D MRSI dataset in the x-y dimension.

Description

Mask a 2D MRSI dataset in the x-y dimension.

Usage

```
mask_xy_mat(mrs_data, mask, value = NA)
```

Arguments

mrs_data MRS data object.

mask matrix of boolean values specifying the voxels to mask, where a value of TRUE

indicates the voxel should be removed.

value the value to set masked data to (usually NA or 0).

Value

masked dataset.

mat2mrs_data 123

mat2mrs_data	Convert a matrix (with spectral points in the column dimension and dynamics in the row dimensions) into a mrs data object.
	aynamics in the row aimensions) into a mis_acia object.

Description

Convert a matrix (with spectral points in the column dimension and dynamics in the row dimensions) into a mrs_data object.

Usage

```
mat2mrs_data(
  mat,
  mrs_data = NULL,
  fs = NULL,
  ft = NULL,
  ref = NULL,
  nuc = NULL,
  fd = FALSE
)
```

Arguments

mat	data matrix.
mrs_data	example data to copy acquisition parameters from.
fs	sampling frequency in Hz.
ft	transmitter frequency in Hz.
ref	reference value for ppm scale.
nuc	resonant nucleus.
fd	flag to indicate if the matrix is in the frequency domain (logical).

Value

mrs_data object.

matayn	Matrix exponential function taken from complexplus package to reduce
matexp	тантх ехропенна зинсион шкен этот сотрыхрих раскаде но теаисе
	the number of spant dependencies.

Description

Matrix exponential function taken from complexplus package to reduce the number of spant dependencies.

124 max_mrs_interp

Usage

matexp(x)

Arguments

Χ

a square complex matrix.

Value

the matrix exponential of x.

max_mrs

Apply the max operator to an MRS dataset.

Description

Apply the max operator to an MRS dataset.

Usage

```
max_mrs(mrs_data)
```

Arguments

mrs_data

MRS data.

Value

MRS data following max operator.

max_mrs_interp

Apply the max operator to an interpolated MRS dataset.

Description

Apply the max operator to an interpolated MRS dataset.

Usage

```
max_mrs_interp(mrs_data, interp_f = 4)
```

Arguments

mrs_data

MRS data.

interp_f

interpolation factor.

mean.list 125

Value

Array of maximum values (real only).

 ${\it mean.list}$

Calculate the mean spectrum from an mrs_data object.

Description

Calculate the mean spectrum from an mrs_data object.

Usage

```
## S3 method for class 'list' mean(x, ...)
```

Arguments

x object of class mrs_data.

... other arguments to pass to the colMeans function.

Value

mean mrs_data object.

mean.mrs_data

Calculate the mean spectrum from an mrs_data object.

Description

Calculate the mean spectrum from an mrs_data object.

Usage

```
## S3 method for class 'mrs_data' mean(x, ...)
```

Arguments

x object of class mrs_data.

... other arguments to pass to the colMeans function.

Value

mean mrs_data object.

mean_dyn_blocks

mean_dyns

Calculate the mean dynamic data.

Description

Calculate the mean dynamic data.

Usage

```
mean_dyns(mrs_data, subset = NULL)
```

Arguments

mrs_data

dynamic MRS data.

subset

vector containing indices to the dynamic scans to be averaged.

Value

mean dynamic data.

mean_dyn_blocks

Calculate the mean of adjacent dynamic scans.

Description

Calculate the mean of adjacent dynamic scans.

Usage

```
mean_dyn_blocks(mrs_data, block_size)
```

Arguments

mrs_data

dynamic MRS data.

block_size

number of adjacent dynamics scans to average over.

Value

dynamic data averaged in blocks.

mean_dyn_pairs 127

mean_dyn_pairs

Calculate the pairwise means across a dynamic data set.

Description

Calculate the pairwise means across a dynamic data set.

Usage

```
mean_dyn_pairs(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

mean dynamic data of adjacent dynamic pairs.

mean_mrs_list

Return the mean of a list of mrs_data objects.

Description

Return the mean of a list of mrs_data objects.

Usage

```
mean_mrs_list(mrs_list)
```

Arguments

mrs_list

list of mrs_data objects.

Value

mean mrs_data object.

128 median_dyns

mean_vec_blocks

Calculate the mean of adjacent blocks in a vector.

Description

Calculate the mean of adjacent blocks in a vector.

Usage

```
mean_vec_blocks(x, block_size)
```

Arguments

x input vector.

block_size number of adjacent elements to average over.

Value

vector data averaged in blocks.

median_dyns

Calculate the median dynamic data.

Description

Calculate the median dynamic data.

Usage

```
median_dyns(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

median dynamic data.

Mod.mrs_data 129

Mod.mrs_data

Apply Mod operator to an MRS dataset.

Description

Apply Mod operator to an MRS dataset.

Usage

```
## S3 method for class 'mrs_data'
Mod(z)
```

Arguments

Z

MRS data.

Value

MRS data following Mod operator.

 mod_td

Apply the Modulus operator to the time-domain MRS signal.

Description

Apply the Modulus operator to the time-domain MRS signal.

Usage

```
mod_td(mrs_data)
```

Arguments

mrs_data

MRS data input.

Value

time-domain modulus of input.

mrs_data2bids

spread across the dynamic dimension in the MRS data.	mrs_data2basis	Convert an mrs_data object to basis object - where basis signals are spread across the dynamic dimension in the MRS data.
--	----------------	---

Description

Convert an mrs_data object to basis object - where basis signals are spread across the dynamic dimension in the MRS data.

Usage

```
mrs_data2basis(mrs_data, names)
```

Arguments

mrs_data object with basis signals spread across the dynamic dimension.

names list of names corresponding to basis signals.

Value

basis set object.

mrs_data2bids

Create a BIDS file structure from a vector of MRS data paths or list of mrs_data objects.

Description

Create a BIDS file structure from a vector of MRS data paths or list of mrs_data objects.

Usage

```
mrs_data2bids(
  mrs_data,
  output_dir,
  suffix = NULL,
  sub = NULL,
  ses = NULL,
  task = NULL,
  acq = NULL,
  nuc = NULL,
  voi = NULL,
  rec = NULL,
  run = NULL,
  echo = NULL,
```

mrs_data2mat

```
inv = NULL,
  skip_existing = TRUE
)
```

Arguments

mrs_data	vector of MRS data paths or list of mrs_data objects.
output_dir	the base directory to create the BIDS structure.
suffix	optional vector of file suffixes. Default behaviour is to automatically determine these from the input data, however it is recommended that they are specified to allow more efficient skipping of existing data.
sub	optional vector of subject labels. If not specified, these will be automatically generated as a series of increasing zero-padded integer values corresponding to the mrs_data input indices.
ses	optional vector of session labels.
task	optional vector of task labels.
acq	optional vector of acquisition labels.
nuc	optional vector of nucleus labels.
voi	optional vector of volume of interest labels.
rec	optional vector of reconstruction labels.
run	optional vector of run indices.
echo	optional vector of echo time indices.
inv	optional vector of inversion indices.
skip_existing	skip any data files that have already been converted. Defaults to TRUE, set to FALSE to force an overwrite of any existing data files.

mrs_data2mat	Convert mrs_data object to a matrix, with spectral points in the col-
	umn dimension and dynamics in the row dimension.

Description

Convert mrs_data object to a matrix, with spectral points in the column dimension and dynamics in the row dimension.

Usage

```
mrs_data2mat(mrs_data, collapse = TRUE)
```

Arguments

mrs_data	MRS data object or list of MRS data objects.

collapse all other dimensions along the dynamic dimension, eg a $16x16\ MRSI$

grid would be first collapsed across 256 dynamic scans.

mrs_data2vec

Value

MRS data matrix.

mrs_data2spec_mat	Convert mrs_data object to a matrix, with spectral points in the col-	
	umn dimension and dynamics in the row dimension.	

Description

Convert mrs_data object to a matrix, with spectral points in the column dimension and dynamics in the row dimension.

Usage

```
mrs_data2spec_mat(mrs_data, collapse = TRUE)
```

Arguments

mrs_data MRS data object or list of MRS data objects.

collapse collapse all other dimensions along the dynamic dimension, eg a 16x16 MRSI

grid would be first collapsed across 256 dynamic scans.

Value

MRS data matrix.

Convert mrs_data object to a vec

Description

Convert mrs_data object to a vector.

Usage

```
mrs_data2vec(mrs_data, dyn = 1, x_pos = 1, y_pos = 1, z_pos = 1, coil = 1)
```

Arguments

mrs_data	MRS data object.
dyn	dynamic index.
x_pos	x index.
y_pos	y index.
z_pos	z index.
coil	coil element index

mvfftshift 133

Value

MRS data vector.

mvfftshift

Perform a fftshift on a matrix, with each column replaced by its shifted result.

Description

Perform a fftshift on a matrix, with each column replaced by its shifted result.

Usage

```
mvfftshift(x)
```

Arguments

Х

matrix input.

Value

output matrix.

mvifftshift

Perform an ifftshift on a matrix, with each column replaced by its shifted result.

Description

Perform an ifftshift on a matrix, with each column replaced by its shifted result.

Usage

```
mvifftshift(x)
```

Arguments

Χ

matrix input.

Value

output matrix.

Ndyns Ndyns

n2coord

Print fit coordinates from a single index.

Description

Print fit coordinates from a single index.

Usage

```
n2coord(n, fit_res)
```

Arguments

n fit index.

fit_res fit_result object.

Ncoils

Return the total number of coil elements in an MRS dataset.

Description

Return the total number of coil elements in an MRS dataset.

Usage

Ncoils(mrs_data)

Arguments

mrs_data

MRS data.

Ndyns

Return the total number of dynamic scans in an MRS dataset.

Description

Return the total number of dynamic scans in an MRS dataset.

Usage

```
Ndyns(mrs_data)
```

Arguments

mrs_data

MRS data.

nifti_flip_lr

nifti_flip_lr

Flip the x data dimension order of a nifti image. This corresponds to flipping MRI data in the left-right direction, assuming the data in save in neurological format (can check with fslorient program).

Description

Flip the x data dimension order of a nifti image. This corresponds to flipping MRI data in the left-right direction, assuming the data in save in neurological format (can check with fslorient program).

Usage

```
nifti_flip_lr(x)
```

Arguments

Х

nifti object to be processed.

Value

nifti object with reversed x data direction.

Npts

Return the number of data points in an MRS dataset.

Description

Return the number of data points in an MRS dataset.

Usage

```
Npts(mrs_data)
```

Arguments

mrs_data

MRS data.

Value

number of data points.

136 Nx

Nspec

Return the total number of spectra in an MRS dataset.

Description

Return the total number of spectra in an MRS dataset.

Usage

```
Nspec(mrs_data)
```

Arguments

mrs_data

MRS data.

Ntrans

Return the total number of acquired transients for an MRS dataset.

Description

Return the total number of acquired transients for an MRS dataset.

Usage

```
Ntrans(mrs_data)
```

Arguments

mrs_data

MRS data.

Nx

Return the total number of x locations in an MRS dataset.

Description

Return the total number of x locations in an MRS dataset.

Usage

```
Nx(mrs_data)
```

Arguments

mrs_data

MRS data.

Ny 137

Ny

Return the total number of y locations in an MRS dataset.

Description

Return the total number of y locations in an MRS dataset.

Usage

```
Ny(mrs_data)
```

Arguments

mrs_data

MRS data.

Nz

Return the total number of z locations in an MRS dataset.

Description

Return the total number of z locations in an MRS dataset.

Usage

```
Nz(mrs_data)
```

Arguments

mrs_data

MRS data.

one_page_pdf

Export a one-page pdf of a single fit result

Description

Export a one-page pdf of a single fit result

Usage

```
one_page_pdf(fit_res, pdf_out_path, title = NULL)
```

Arguments

fit_res fit_result object.

pdf_out_path path to the exported pdf file.

title ouptut title.

138 ortho3

ortho3

Display an orthographic projection plot of a nifti object.

Description

Display an orthographic projection plot of a nifti object.

Usage

```
ortho3(
  underlay,
  overlay = NULL,
 xyz = NULL,
  zlim = NULL,
  zlim_ol = NULL,
  alpha = 0.7,
  col_ol = viridisLite::viridis(64),
  orient_lab = TRUE,
  rescale = 1,
  crosshairs = TRUE,
  ch_lwd = 1,
  colourbar = TRUE,
 bg = "black",
 mar = c(0, 0, 0, 0),
  smallplot = c(0.63, 0.65, 0.07, 0.42),
  legend_axis_cex = 0.75
)
```

Arguments

underlay

```
overlay
                  optional overlay image.
xyz
                  x, y, z slice coordinates to display.
zlim
                  underlay intensity limits.
zlim_ol
                  overlay intensity limits.
alpha
                  transparency of overlay.
col_ol
                  colour palette of overlay.
orient_lab
                  display orientation labels (default TRUE).
                  rescale factor for the underlay and overlay images.
rescale
crosshairs
                  display the crosshairs (default TRUE).
ch_lwd
                  crosshair linewidth.
colourbar
                  display a colourbar for the overlay (default TRUE).
                  plot background colour.
bg
```

underlay image to be shown in grayscale.

ortho3_inter

```
mar plot margins.

smallplot smallplot option for positioning the colourbar.

legend_axis_cex
fornt expansion factor for the legend axis text.
```

ortho3_inter

Display an interactive orthographic projection plot of a nifti object.

Description

Display an interactive orthographic projection plot of a nifti object.

Usage

```
ortho3_inter(
  underlay,
  overlay = NULL,
  xyz = NULL,
  zlim = NULL,
  zlim_ol = NULL,
  alpha = 0.7,
  ...
)
```

Arguments

```
underlay underlay image to be shown in grayscale.

overlay optional overlay image.

xyz x, y, z slice coordinates to display.

zlim underlay intensity limits.

zlim_ol overlay intensity limits.

alpha transparency of overlay.

... other options to be passed to the ortho3 function.
```

pg_extrap_xy

peak_info	Search for the highest peak in a spectral region and return the frequency, height and FWHM.

Description

Search for the highest peak in a spectral region and return the frequency, height and FWHM.

Usage

```
peak_info(
  mrs_data,
  xlim = c(4, 0.5),
  interp_f = 4,
  scale = "ppm",
  mode = "real"
)
```

Arguments

mrs_data	an object of class mrs_data.
xlim	frequency range (default units of PPM) to search for the highest peak.
interp_f	interpolation factor, defaults to 4x.
scale	the units to use for the frequency scale, can be one of: "ppm", "hz" or "points".
mode	spectral mode, can be: "real", "imag" or "mod".

Value

list of arrays containing the highest peak frequency, height and FWHM in units of PPM and Hz.

ng outnon w	Danaulia Cauchhana (DC) ala anishmumatha difan hangaa antugnalatian
pg_extrap_xy	Papoulis- $Gerchberg$ (PG) $algorithm$ $method$ for k - $space$ $extrapolation$.

Description

PG method as described in: Haupt CI, Schuff N, Weiner MW, Maudsley AA. Removal of lipid artifacts in 1H spectroscopic imaging by data extrapolation. Magn Reson Med. 1996 May;35(5):678-87. Extrapolation is performed to expand k-space coverage by a factor of 2, with the aim to reduce Gibbs ringing.

phase 141

Usage

```
pg_extrap_xy(
  mrs_data,
  img_mask = NULL,
  kspace_mask = NULL,
  intensity_thresh = 0.15,
  iters = 50
)
```

Arguments

mrs_data MRS data object.

img_mask a boolean matrix of voxels with strong signals to be extrapolated. Must be twice

the dimensions of the input data.

kspace_mask a boolean matrix of kspace points that have been sampled. Typically a circle for

MRSI, but defaults to the full rectangular area of k-space covered by the input

data. Must match the x-y dimensions of the input data.

intensity_thresh

used to define img_mask based on the strength of the signal in each voxel. Defaults to intensities greater than 15% of the maximum. Ignored if img_mask is

specified as argument.

iters number of iterations to perform.

Value

extrapolated mrs_data object.

phase

Apply phasing parameters to MRS data.

Description

Apply phasing parameters to MRS data.

Usage

```
phase(mrs_data, zero_order, first_order = 0)
```

Arguments

mrs_data MRS data.

zero_order zero'th order phase term in degrees.

first_order first order (frequency dependent) phase term in ms.

Value

MRS data with applied phase parameters.

plot.fit_result

Description

Corrected zero order phase and chemical shift offset in 1H MRS data from the brain.

Usage

```
phase_ref_1h_brain(mrs_data, mean_ref = FALSE, ret_corr_only = TRUE)
```

Arguments

```
mrs_data MRS data to be corrected.

mean_ref apply the phase and offset of the mean spectrum to all others. Default is FALSE.

ret_corr_only return the corrected data only.
```

Value

corrected MRS data.

plot.fit_result

Plot the fitting results of an object of class fit_result.

Description

Plot the fitting results of an object of class fit_result.

Usage

```
## S3 method for class 'fit_result'
plot(
    x,
    dyn = 1,
    x_pos = 1,
    y_pos = 1,
    z_pos = 1,
    coil = 1,
    xlim = NULL,
    data_only = FALSE,
    label = NULL,
    plot_sigs = NULL,
    n = NULL,
    sub_bl = FALSE,
```

plot.fit_result 143

```
mar = NULL,
restore_def_par = TRUE,
ylim = NULL,
y_scale = FALSE,
show_grid = TRUE,
grid_nx = NULL,
grid_ny = NA,
invert_fit = FALSE,
...
)
```

Arguments

fit_result object. Х the dynamic index to plot. dyn the x index to plot. x_pos the y index to plot. y_pos the z index to plot. z_pos the coil element number to plot. coil the range of values to display on the x-axis, eg xlim = c(4,1). xlim data_only display only the processed data (logical). label character string to add to the top left of the plot window. plot_sigs a character vector of signal names to add to the plot. single index element to plot (overrides other indices when given). sub_bl subtract the baseline from the data and fit (logical). option to adjust the plot margins. See ?par. mar restore_def_par restore default plotting par values after the plot has been made. ylim range of values to display on the y-axis, eg ylim = c(0,10). option to display the y-axis values (logical). y_scale plot gridlines behind the data (logical). Defaults to TRUE. show_grid grid_nx number of cells of the grid in x and y direction. When NULL the grid aligns with the tick marks on the corresponding default axis (i.e., tickmarks as computed by axTicks). When NA, no grid lines are drawn in the corresponding direction. grid_ny as above. show the fit result "upside-down"/ invert_fit further arguments to plot method. . . .

144 plot.mrs_data

plot.mrs_data

Plotting method for objects of class mrs_data.

Description

Plotting method for objects of class mrs_data.

Usage

```
## S3 method for class 'mrs_data'
plot(
  Х,
  dyn = 1,
  x_pos = 1,
 y_pos = 1,
  z_pos = 1,
  coil = 1,
  fd = TRUE,
  x_{units} = NULL,
 xlim = NULL,
 y_scale = FALSE,
  x_ax = TRUE,
 mode = "re",
  1wd = NULL,
  bty = NULL,
  label = "",
  restore_def_par = TRUE,
 mar = NULL,
  xaxis_lab = NULL,
  yaxis_lab = NULL,
  xat = NULL,
  xlabs = TRUE,
 yat = NULL,
 ylabs = TRUE,
  show_grid = TRUE,
  grid_nx = NULL,
  grid_ny = NA,
  col = NULL,
  alpha = NULL,
  bl_lty = NULL,
  hline = NULL,
  hline_lty = 2,
 hline_col = "red",
  vline = NULL,
  vline_lty = 2,
  vline_col = "red",
```

plot.mrs_data 145

)

Arguments

x object of class mrs_data.

dyn the dynamic index to plot.

x_pos the x index to plot.y_pos the y index to plot.z_pos the z index to plot.

coil the coil element number to plot.

fd display data in the frequency-domain (default), or time-domain (logical).

x_units the units to use for the x-axis, can be one of: "ppm", "hz", "points" or "seconds".

xlim the range of values to display on the x-axis, eg xlim = c(4,1).

y_scale option to display the y-axis values (logical). x_ax option to display the x-axis values (logical).

mode representation of the complex numbers to be plotted, can be one of: "re", "im",

"mod" or "arg".

lwd plot linewidth.

bty option to draw a box around the plot. See ?par.

label character string to add to the top left of the plot window.

restore_def_par

restore default plotting par values after the plot has been made.

mar option to adjust the plot margins. See ?par.

xaxis_lab x-axis label. yaxis_lab y-axis label.

xat x-axis tick label values.
x1abs x-axis tick labels.
yat y-axis tick label values.
y1abs y-axis tick labels.

show_grid plot gridlines behind the data (logical). Defaults to TRUE.

grid_nx number of cells of the grid in x and y direction. When NULL the grid aligns with

the tick marks on the corresponding default axis (i.e., tickmarks as computed by axTicks). When NA, no grid lines are drawn in the corresponding direction.

grid_ny as above.

set the line colour, eg col = rgb(0.5, 0.5, 0.5).

alpha set the line transparency, eg alpha = 0.5 is 50% transparency. Overrides any

transparency levels set by col.

bl_lty linetype for the y = 0 baseline trace. A default value NULL results in no baseline

being plotted.

hline add a horizontal line at the specified value.

plot_reg

hline_lty linetype for the horizontal line.
hline_col colour for the horizontal line.

vline add a vertical line at the specified value.

vline_lty linetype for the vertical line. vline_col colour for the vertical line.

... other arguments to pass to the plot method.

plot_bc Convenience function to plot a baseline estimate with the original data.

Description

Convenience function to plot a baseline estimate with the original data.

Usage

```
plot_bc(orig_data, bc_data, ...)
```

Arguments

orig_data the original data.

bc_data the baseline corrected data.

... other arguments to pass to the stackplot function.

plot_reg Plot regressors as an image.

Description

Plot regressors as an image.

Usage

```
plot_reg(regressor_df)
```

Arguments

regressor_df input regressor data frame.

plot_slice_fit 147

plot_slice_fit

Plot a 2D slice from an MRSI fit result object.

Description

Plot a 2D slice from an MRSI fit result object.

Usage

```
plot_slice_fit(
  fit_res,
  map,
  map_denom = NULL,
  slice = 1,
  zlim = NULL,
  interp = 1
)
```

Arguments

```
fit_res  
fit_result object.

map  
fit result values to display as a colour map. Can be specified as a character string or array of numeric values. Defaults to "tNAA".

map_denom  
fit result values to divide the map argument by. Can be specified as a character string (eg "tCr") or array of numeric values.

slice  
slice to plot in the z direction.

zlim  
range of values to plot.

interp  
interpolation factor.
```

Description

Plot a 2D slice from an MRSI fit result object.

```
plot_slice_fit_inter(
   fit_res,
   map = NULL,
   map_denom = NULL,
   slice = 1,
   zlim = NULL,
   interp = 1,
   xlim = NULL
)
```

plot_slice_map

Arguments

fit_result object. fit_res fit result values to display as a colour map. Can be specified as a character string map or array of numeric values. Defaults to "tNAA". map_denom fit result values to divide the map argument by. Can be specified as a character string (eg "tCr") or array of numeric values. slice slice to plot in the z direction. zlim range of values to plot. interp interpolation factor. xlim spectral plot limits for the x axis.

plot_slice_map

Plot a slice from a 7 dimensional array.

Description

Plot a slice from a 7 dimensional array.

Usage

```
plot_slice_map(
   data,
   zlim = NULL,
   mask_map = NULL,
   mask_cutoff = 20,
   interp = 1,
   slice = 1,
   dyn = 1,
   coil = 1,
   ref = 1,
   denom = NULL,
   horizontal = FALSE
)
```

Arguments

data 7d array of values to be plotted.

zlim smallest and largest values to be plotted.

mask_map matching map with logical values to indicate if the corresponding values should

be plotted.

mask_cutoff minimum values to plot (as a percentage of the maximum).

interp map interpolation factor. slice the slice index to plot. plot_slice_map_inter 149

```
dyn the dynamic index to plot.

coil the coil element number to plot.

ref reference index to plot.

denom map to use as a denominator.

horizontal display the colourbar horizontally (logical).
```

plot_slice_map_inter

Plot an interactive slice map from a data array where voxels can be selected to display a corresponding spectrum.

Description

Plot an interactive slice map from a data array where voxels can be selected to display a corresponding spectrum.

Usage

```
plot_slice_map_inter(
 mrs_data,
 map = NULL,
 xlim = NULL,
  slice = 1,
  zlim = NULL,
 mask_map = NULL,
 denom = NULL,
 mask_cutoff = 20,
  interp = 1,
 mode = "re",
 y_scale = FALSE,
 ylim = NULL,
  coil = 1,
  fd = TRUE
)
```

Arguments

mrs_data	spectral data.
map	array of values to be plotted, defaults to the integration of the modulus of the full spectral width.
xlim	spectral region to plot.
slice	the slice index to plot.
zlim	smallest and largest values to be plotted.
mask_map	matching map with logical values to indicate if the corresponding values should be plotted.

plot_voi_overlay

denom map to use as a denominator.

mask_cutoff minimum values to plot (as a percentage of the maximum).

interp map interpolation factor.

mode representation of the complex spectrum to be plotted, can be one of: "re", "im",

"mod" or "arg".

y_scale option to display the y-axis values (logical).

ylim intensity range to plot. coil coil element to plot.

fd display data in the frequency-domain (default), or time-domain (logical).

plot_spec_sd

Plot the spectral standard deviation.

Description

Plot the spectral standard deviation.

Usage

```
plot_spec_sd(mrs_data, xlim = NULL, scale_sd = 1.96, ...)
```

Arguments

mrs_data MRS data to be plotted. xlim plotting limits in ppm.

scale_sd scaling factor for the standard deviation trace.
... other arguments passed to the stackplot function.

plot_voi_overlay

Plot a volume as an image overlay.

Description

Plot a volume as an image overlay.

Usage

```
plot_voi_overlay(mri, voi, export_path = NULL, zlim = NULL, ...)
```

Arguments

mri image data as a nifti object or path to data file.
voi volume data as a nifti object or path to data file.
export_path optional path to save the image in png format.

zlim underlay intensity limits.

... additional arguments to the ortho3 function.

plot_voi_overlay_seg 151

Description

Plot a volume as an overlay on a segmented brain volume.

Usage

```
plot_voi_overlay_seg(mri_seg, voi, export_path = NULL, ...)
```

Arguments

mri_seg segmented brain volume as a nifti object.

voi volume data as a nifti object.

export_path optional path to save the image in png format.
... additional arguments to the ortho3 function.

ppm

Return the ppm scale of an MRS dataset or fit result.

Description

Return the ppm scale of an MRS dataset or fit result.

Usage

```
ppm(x, ft = NULL, ref = NULL, fs = NULL, N = NULL)
## S3 method for class 'mrs_data'
ppm(x, ft = NULL, ref = NULL, fs = NULL, N = NULL)
## S3 method for class 'fit_result'
ppm(x, ft = NULL, ref = NULL, fs = NULL, N = NULL)
```

Arguments

x	MRS dataset of fit result.
ft	transmitter frequency in Hz, does not apply when the object is a fit result.
ref	reference value for ppm scale, does not apply when the object is a fit result.
fs	sampling frequency in Hz, does not apply when the object is a fit result.
N	number of data points in the spectral dimension, does not apply when the object is a fit result

152 preproc_svs

Value

ppm scale.

precomp

Save function results to file and load on subsequent calls to avoid re-

peat computation.

Description

Save function results to file and load on subsequent calls to avoid repeat computation.

Usage

```
precomp(file, fun, ...)
```

Arguments

file file name to write the results.

fun function to run.

... arguments to be passed to fun.

preproc_svs

Preprocess and perform quality assessment of a single SVS data set.

Description

Preprocess and perform quality assessment of a single SVS data set.

Usage

```
preproc_svs(path, label = NULL, output_dir = NULL, ref_inds = NULL)
```

Arguments

path to the fMRS data file or IMA directory.

label a label to describe the data set.

output_dir output directory.

ref_inds a vector of 1-based indices for any water reference dynamic scans.

preproc_svs_dataset 153

preproc_svs_dataset

Preprocess and perform quality assessment of one or more SVS data sets.

Description

Preprocess and perform quality assessment of one or more SVS data sets.

Usage

```
preproc_svs_dataset(
  paths,
  labels = NULL,
  output_dir = "spant_analysis",
  exclude_labels = NULL,
  overwrite = FALSE,
  ref_inds = NULL,
  return_results = FALSE
)
```

Arguments

paths paths to the fMRS data file or IMA directory.

labels labels to describe each data set.

output_dir output directory.

exclude_labels vector of labels of scans to exclude, eg poor quality data.

overwrite overwrite saved results, defaults to FALSE.

ref_inds a vector of 1-based indices for any water reference dynamic scans.

return_results function will return key outputs, defaults to FALSE.

print.fit_result

Print a summary of an object of class fit_result.

Description

Print a summary of an object of class fit_result.

Usage

```
## S3 method for class 'fit_result'
print(x, ...)
```

Arguments

```
x fit_result object.
... further arguments.
```

154 qn_states

print.mrs_data

Print a summary of mrs_data parameters.

Description

Print a summary of mrs_data parameters.

Usage

```
## S3 method for class 'mrs_data'
print(x, full = FALSE, ...)
```

Arguments

x mrs_data object.

full print all parameters (default FALSE).

... further arguments.

qn_states

Get the quantum coherence matrix for a spin system.

Description

Get the quantum coherence matrix for a spin system.

Usage

```
qn_states(sys)
```

Arguments

sys

spin system object.

Value

quantum coherence number matrix.

rats 155

rats

Robust Alignment to a Target Spectrum (RATS).

Description

Robust Alignment to a Target Spectrum (RATS).

Usage

```
rats(
 mrs_data,
 ref = NULL,
 xlim = c(4, 0.5),
 max_shift = 20,
 p_{deg} = 2,
  sp_N = 2,
 sp_deg = 3,
 max_t = 0.2,
 basis_type = "poly",
  rescale_output = TRUE,
 phase_corr = TRUE,
  ret_corr_only = TRUE,
  zero_freq_shift_t0 = FALSE,
  remove_freq_outliers = FALSE,
  freq_outlier_thresh = 3,
  remove_phase_outliers = FALSE,
  phase_outlier_thresh = 3,
  remove_amp_outliers = FALSE,
  amp\_outlier\_thresh = 3
)
```

Arguments

mr	s_data	MRS data to be corrected.
re	ef .	optional MRS data to use as a reference, the mean of all dynamics is used if this argument is not supplied.
x1	im	optional frequency range to perform optimisation, set to NULL to use the full range.
ma	x_shift	maximum allowable frequency shift in Hz.
p_	deg	polynomial degree used for baseline modelling. Negative values disable baseline modelling.
sp	_N	number of spline functions, note the true number will be sp_N + sp_deg.
sp	_deg	degree of spline functions.
ma	ıx_t	truncate the FID when longer than max_t to reduce time taken, set to NULL to use the entire FID.

156 Re.mrs_data

basis_type may be one of "poly" or "spline".

rescale_output rescale the bl_matched_spec and bl output to improve consistency between dy-

namic scans.

phase_corr apply phase correction (in addition to frequency). TRUE by default.

ret_corr_only return the corrected mrs_data object only.

zero_freq_shift_t0

perform a linear fit to the frequency shifts and set the (linearly modeled) shift to

be 0 Hz for the first dynamic scan.

remove_freq_outliers

remove dynamics based on their frequency shift.

freq_outlier_thresh

threshold to remove frequency outliers.

remove_phase_outliers

remove dynamics based on their phase shift.

phase_outlier_thresh

threshold to remove phase outliers.

remove_amp_outliers

remove dynamics based on their amplitude change.

amp_outlier_thresh

threshold to remove amplitude outliers.

Value

a list containing the corrected data; phase and shift values in units of degrees and Hz respectively.

Re.mrs_data

Apply Re operator to an MRS dataset.

Description

Apply Re operator to an MRS dataset.

Usage

```
## S3 method for class 'mrs_data' Re(z)
```

Arguments

Z

MRS data.

Value

MRS data following Re operator.

read_basis 157

raad	hacic
read	บสราร

Read a basis file in LCModel .basis format.

Description

Read a basis file in LCModel .basis format.

Usage

```
read_basis(basis_file, ref = def_ref(), sort_basis = TRUE)
```

Arguments

basis_file path to basis file.

ref assumed ppm reference value.

sort_basis sort the basis set based on signal names.

Value

basis object.

read_ima_coil_dir

Read a directory containing Siemens MRS IMA files and combine along the coil dimension. Note that the coil ID is inferred from the sorted file name and should be checked when consistency is required between two directories.

Description

Read a directory containing Siemens MRS IMA files and combine along the coil dimension. Note that the coil ID is inferred from the sorted file name and should be checked when consistency is required between two directories.

Usage

```
read_ima_coil_dir(dir, extra = NULL, verbose = FALSE)
```

Arguments

dir data directory path.

extra an optional data frame to provide additional variables for use in subsequent anal-

ysis steps, eg id or grouping variables.

verbose output extra information to the console.

Value

mrs_data object.

read_lcm_coord

read_ima_dyn_dir	Read a directory containing Siemens MRS IMA files and combine
	along the dynamic dimension. Note that the coil ID is inferred from the sorted file name and should be checked when consistency is required.
	sorted file name and should be thethed when consistency is required.

Description

Read a directory containing Siemens MRS IMA files and combine along the dynamic dimension. Note that the coil ID is inferred from the sorted file name and should be checked when consistency is required.

Usage

```
read_ima_dyn_dir(dir, extra = NULL, verbose = FALSE)
```

Arguments

dir data directory path.

extra an optional data frame to provide additional variables for use in subsequent anal-

ysis steps, eg id or grouping variables.

verbose output extra information to the console.

Value

mrs_data object.

read_lcm_coord

Read an LCModel formatted coord file containing fit information.

Description

Read an LCModel formatted coord file containing fit information.

Usage

```
read_lcm_coord(coord_f)
```

Arguments

coord_f path to the coord file.

Value

list containing a table of fit point and results structure containing signal amplitudes, errors and fitting diagnostics.

read_mrs 159

read_mrs

Read MRS data from the filesystem.

Description

Read MRS data from the filesystem.

Usage

```
read_mrs(
  path,
  format = NULL,
  ft = NULL,
  fs = NULL,
  ref = NULL,
  n_ref_scans = NULL,
  full_fid = FALSE,
  omit_svs_ref_scans = TRUE,
  verbose = FALSE,
  extra = NULL,
  fid_filt_dist = NULL
)
```

Arguments

path	file name or directory containing the MRS data.
format	string describing the data format. Must be one of the following: "spar_sdat", "rda", "dicom", "twix", "pfile", "list_data", "paravis", "dpt", "lcm_raw", "rds", "nifti", "varian", "jmrui_txt". If not specified, the format will be guessed from the filename extension, or will be assumed to be a Siemens ima dynamic data if the path is a directory.
ft	transmitter frequency in Hz (required for list_data format).
fs	sampling frequency in Hz (required for list_data format).
ref	reference value for ppm scale (required for list_data format).
n_ref_scans	override the number of water reference scans detected in the file header (GE p-file only).
full_fid	export all data points, including those before the start of the FID (default = FALSE), TWIX format only.
omit_svs_ref_sc	cans
	$remove \ any \ reference \ scans \ sometimes \ saved \ in \ SVS \ twix \ data \ (default = TRUE).$
verbose	print data file information (default = FALSE).
extra	an optional data frame to provide additional variables for use in subsequent analysis steps, eg id or grouping variables.
fid_filt_dist	indicate if the data has a distorted FID due to a brick-wall filter being used to downsample the data. Default is to auto detect this from the data, but TRUE or

FALSE options can be given to override detection.

read_mrs_tqn

Value

MRS data object.

Examples

```
fname <- system.file("extdata", "philips_spar_sdat_WS.SDAT", package = "spant")
mrs_data <- read_mrs(fname)
print(mrs_data)</pre>
```

 $read_mrs_tqn$

Read MRS data using the TARQUIN software package.

Description

Read MRS data using the TARQUIN software package.

Usage

```
read_mrs_tqn(fname, fname_ref = NA, format, id = NA, group = NA)
```

Arguments

fname the filename containing the MRS data.

fname_ref a second filename containing reference MRS data.

format format of the MRS data. Can be one of the following: siemens, philips, ge, dcm,

dpt, rda, lcm, varian, bruker, jmrui_txt.

id optional ID string.group optional group string.

Value

MRS data object.

Examples

```
fname <- system.file("extdata","philips_spar_sdat_WS.SDAT",package="spant")
## Not run:
mrs_data <- read_mrs_tqn(fname, format="philips")
## End(Not run)</pre>
```

read_pulse_ascii 161

read_pulse_ascii

Read an ASCII formatted pulse file.

Description

Read an ASCII formatted pulse file.

Usage

```
read_pulse_ascii(fname, deg2rad = TRUE)
```

Arguments

fname ASCII formatted pulse file path.

deg2rad convert phase values stored in degrees to radians.

Value

pulse waveform and header.

read_pulse_bruker

Read a Bruker formatted pulse file

Description

Read a Bruker formatted pulse file

Usage

```
read_pulse_bruker(fname)
```

Arguments

fname

Bruker formatted pulse file path.

Value

pulse waveform and header.

read_siemens_txt_hdr

read_pulse_pta

Read a .pta formatted pulse file compatible with Siemens PulseTool.

Description

Read a .pta formatted pulse file compatible with Siemens PulseTool.

Usage

```
read_pulse_pta(fname)
```

Arguments

fname pta formatted pulse file path.

Value

pulse waveform and header.

read_siemens_txt_hdr Read the text format header found in Siemens IMA and TWIX data files.

Description

Read the text format header found in Siemens IMA and TWIX data files.

Usage

```
read_siemens_txt_hdr(input, version = "vd", verbose = FALSE, offset = 0)
```

Arguments

input file name to read or raw data.

version software version, can be "vb" or "vd".

verbose print information to the console.

offset offset to begin searching for the text header.

Value

a list of parameter values

read_tqn_fit 163

read_tqn_fit

Reader for csv fit results generated by TARQUIN.

Description

Reader for csv fit results generated by TARQUIN.

Usage

```
read_tqn_fit(fit_f)
```

Arguments

fit_f TARQUIN fit file.

Value

A data frame of the fit data points.

Examples

```
## Not run:
fit <- read_tqn_fit(system.file("extdata","fit.csv",package="spant"))
## End(Not run)</pre>
```

read_tqn_result

Reader for csv results generated by TARQUIN.

Description

Reader for csv results generated by TARQUIN.

Usage

```
read_tqn_result(result_f, remove_rcs = TRUE)
```

Arguments

result_f TARQUIN result file.

remove_rcs omit row, column and slice ids from output.

Value

list of amplitudes, crlbs and diagnostics.

recon_imag_vec

Examples

```
## Not run:
result <- read_tqn_result(system.file("extdata","result.csv",package="spant"))
## End(Not run)</pre>
```

recon_imag

Reconstruct complex time-domain data from the real part of frequency-domain data.

Description

Reconstruct complex time-domain data from the real part of frequency-domain data.

Usage

```
recon_imag(mrs_data)
```

Arguments

mrs_data

MRS data.

Value

reconstructed MRS data.

recon_imag_vec

Reconstruct complex time-domain data from the real part of frequency-domain data.

Description

Reconstruct complex time-domain data from the real part of frequency-domain data.

Usage

```
recon_imag_vec(data)
```

Arguments

data

data points in the frequency domain.

Value

reconstructed signal.

recon_twix_2d_mrsi 165

recon_twix_2d_mrsi

Reconstruct 2D MRSI data from a twix file loaded with read_mrs.

Description

Reconstruct 2D MRSI data from a twix file loaded with read_mrs.

Usage

```
recon_twix_2d_mrsi(twix_mrs)
```

Arguments

twix_mrs

raw dynamic data.

Value

reconstructed data.

rectangular_mask

Create a rectangular mask stored as a matrix of logical values.

Description

Create a rectangular mask stored as a matrix of logical values.

Usage

```
rectangular_mask(xN, yN, x0, y0, xw, yw, angle)
```

Arguments

×Ν	number of pixels in the x dimension.
yN	number of pixels in the y dimension.
x0	centre of rectangle in the x direction in units of pixels.
y0	centre of rectangle in the y direction in units of pixels.
XW	width in the x direction in units of pixels.
yw	width in the y direction in units of pixels.
angle	angle of rotation in degrees.

Value

logical mask matrix with dimensions fov_yN x fov_xN.

rep_dyn

rep_array_dim

Repeat an array over a given dimension.

Description

Repeat an array over a given dimension.

Usage

```
rep_array_dim(x, rep_dim, n)
```

Arguments

x array.

rep_dim dimension to extend.

n number of times to repeat.

Value

extended array.

rep_dyn

Replicate a scan in the dynamic dimension.

Description

Replicate a scan in the dynamic dimension.

Usage

```
rep_dyn(mrs_data, times)
```

Arguments

mrs_data MRS data to be replicated.
times number of times to replicate.

Value

replicated data object.

rep_mrs 167

rep_mrs

Replicate a scan over a given dimension.

Description

Replicate a scan over a given dimension.

Usage

```
rep_mrs(
    mrs_data,
    x_rep = 1,
    y_rep = 1,
    z_rep = 1,
    dyn_rep = 1,
    coil_rep = 1,
    warn = TRUE
)
```

Arguments

mrs_data	MRS data to be replicated.
x_rep	number of x replications.
y_rep	number of y replications.
z_rep	number of z replications.
dyn_rep	number of dynamic replications.
coil_rep	number of coil replications.
warn	print a warning when the data dimensions do not change.

Value

replicated data object.

resample_basis

Resample a basis-set to match a mrs_data acquisition.

Description

Resample a basis-set to match a mrs_data acquisition.

```
resample_basis(basis, mrs_data, ref_freq_match = TRUE)
```

168 resample_voi

Arguments

basis the basis to be resampled.

mrs_data the mrs_data to match the number of data points and sampling frequency.

ref_freq_match apply a frequency shift to the basis to match the reference frequency (usually

4.65 or 4.68) of the mrs_data.

Value

resampled basis set object.

resample_img

Resample an image to match a target image space.

Description

Resample an image to match a target image space.

Usage

```
resample_img(source, target, interp = 3L)
```

Arguments

source image data as a nifti object. target image data as a nifti object.

interp interpolation parameter, see nifyreg.linear definition.

Value

resampled image data as a nifti object.

resample_voi

Resample a VOI to match a target image space using nearest-neighbour interpolation.

Description

Resample a VOI to match a target image space using nearest-neighbour interpolation.

```
resample_voi(voi, mri)
```

reslice_to_mrs 169

Arguments

voi volume data as a nifti object. mri image data as a nifti object.

Value

volume data as a nifti object.

reslice_to_mrs

Reslice a nifti object to match the orientation of mrs data.

Description

Reslice a nifti object to match the orientation of mrs data.

Usage

```
reslice_to_mrs(mri, mrs, interp = 3L)
```

Arguments

mri nifti object to be resliced.

mrs_data object for the target orientation.

interp interpolation parameter, see nifyreg.linear definition.

Value

resliced imaging data.

reson_table2mrs_data

Generate mrs_data from a table of single Lorentzian resonances.

Description

Generate mrs_data from a table of single Lorentzian resonances.

```
reson_table2mrs_data(
  reson_table,
  acq_paras = def_acq_paras(),
  back_extrap_pts = 0
)
```

rm_dyns

Arguments

reson_table as produced by the hsvd function.
acq_paras list of acquisition parameters. See

back_extrap_pts

number of data points to back extrapolate def_acq_paras

Value

mrs_data object.

re_weighting

Apply a weighting to the FID to enhance spectral resolution.

Description

Apply a weighting to the FID to enhance spectral resolution.

Usage

```
re_weighting(mrs_data, re, alpha)
```

Arguments

mrs_data data to be enhanced.

re resolution enhancement factor (rising exponential factor).

alpha alpha factor (Gaussian decay)

Value

resolution enhanced mrs_data.

rm_dyns

Remove a subset of dynamic scans.

Description

Remove a subset of dynamic scans.

```
rm_dyns(mrs_data, subset)
```

scale_amp_legacy 171

Arguments

mrs_data dynamic MRS data.

subset vector containing indices to the dynamic scans to be removed.

Value

MRS data without the specified dynamic scans.

scale_amp_legacy Apply water reference scaling to a fitting results object to yield metabolite quantities in units of "mmol per Kg wet weight".

Description

See the LCModel manual (section 10.2) on water-scaling for details on the assumptions and relevant references. Use this type of concentration scaling to compare fit results with LCModel and TARQUIN defaults. Otherwise scale_amp_molal_pvc is the preferred method. Note, the LCModel manual (section 1.3) states:

Usage

```
scale_amp_legacy(fit_result, ref_data, w_att = 0.7, w_conc = 35880, ...)
```

Arguments

fit_result	a result object generated from fitting.
ref_data	water reference MRS data object.
w_att	water attenuation factor (default = 0.7). Assumes water T2 of 80ms and a TE = 30 ms. exp(- 30 ms / 80 ms) ~ 0.7.
w_conc	assumed water concentration (default = 35880). Default value corresponds to typical white matter. Set to 43300 for gray matter, and 55556 for phantom measurements.
	additional arguments to get_td_amp function.

Details

"Concentrations should be labelled 'mmol per Kg wet weight'. We use the shorter (incorrect) abbreviation mM. The actual mM is the mmol per Kg wet weight multiplied by the specific gravity of the tissue, typically 1.04 in brain."

Value

a fit_result object with a rescaled results table.

172 scale_amp_molal

scale_amp_molal Apply water reference scaling to a fitting results object to yield metabolite quantities in millimolar (mM) units (mol/kg of tissue water).

Description

Note, this function assumes the volume contains a homogeneous voxel, eg pure WM, GM or CSF. Also note that in the case of a homogeneous voxel the relative densities of MR-visible water (eg GM=0.78, WM=0.65, and CSF=0.97) cancel out and don't need to be considered. Use scale_amp_molal_pvc for volumes containing multiple compartments. Details of this method can be found in "Use of tissue water as a concentration reference for proton spectroscopic imaging" by Gasparovic et al MRM 2006 55(6):1219-26.

Usage

```
scale_amp_molal(
   fit_result,
   ref_data,
   te,
   tr,
   water_t1,
   water_t2,
   metab_t1,
   metab_t2,
   ...
)
```

Arguments

```
fit_result
                  result object generated from fitting.
                  water reference MRS data object.
ref_data
te
                  the MRS TE in seconds.
                  the MRS TR in seconds.
tr
                  assumed water T1 value.
water_t1
water_t2
                  assumed water T2 value.
metab_t1
                  assumed metabolite T1 value.
                  assumed metabolite T2 value.
metab_t2
                  additional arguments to get_td_amp function.
```

Value

A fit_result object with a rescaled results table.

scale_amp_molal_pvc 173

scale_amp_molal_pvc	Apply water reference scaling to a fitting results object to yield metabolite quantities in millimolar (mM) units (mol / kg of tissue water).
scale_amp_molal_pvc	metabolite quantities in millimolar (mM) units (mol / kg of tissue wa-

Description

Details of this method can be found in "Use of tissue water as a concentration reference for proton spectroscopic imaging" by Gasparovic et al MRM 2006 55(6):1219-26. 1.5 Tesla relaxation assumptions are taken from this paper. For 3 Tesla data, relaxation assumptions are taken from "NMR relaxation times in the human brain at 3.0 Tesla" by Wansapura et al J Magn Reson Imaging 1999 9(4):531-8.

Usage

```
scale_amp_molal_pvc(fit_result, ref_data, p_vols, te, tr, ...)
```

Arguments

fit_result	result object generated from fitting.
ref_data	water reference MRS data object.
p_vols	a numeric vector of partial volumes expressed as percentages. For example, a voxel containing 100% white matter tissue would use : $p_vols = c(WM = 100, GM = 0, CSF = 0)$.
te	the MRS TE in seconds.
tr	the MRS TR in seconds.
	additional arguments to get_td_amp function.

Value

A fit_result object with a rescaled results table.

scale_amp_molar	Apply water reference scaling to a fitting results object to yield metabolite quantities in millimolar (mM) units (mol / Litre of tissue). This function is depreciated, please use scale_amp_legacy instead.
	This function is depreciated, please use scale_amp_legacy instead.

Description

See the LCModel manual (section 10.2) on water-scaling for details on the assumptions and relevant references. Use this type of concentration scaling to compare fit results with LCModel and TARQUIN defaults. Otherwise scale_amp_molal_pvc is generally the preferred method.

Usage

```
scale_amp_molar(fit_result, ref_data, w_att = 0.7, w_conc = 35880, ...)
```

Arguments

fit_result a result object generated from fitting.

ref_data water reference MRS data object.

w_att water attenuation factor (default = 0.7). Assumes water T2 of 80ms and a TE = 30 ms. exp(-30ms / 80ms) ~ 0.7.

w_conc assumed water concentration (default = 35880). Default value corresponds to

typical white matter. Set to 43300 for gray matter, and 55556 for phantom mea-

surements.

.. additional arguments to get_td_amp function.

Value

a fit_result object with a rescaled results table.

```
scale_amp_molar2molal_pvc
```

Convert default LCM/TARQUIN concentration scaling to molal units with partial volume correction.

Description

Convert default LCM/TARQUIN concentration scaling to molal units with partial volume correction.

Usage

```
scale_amp_molar2molal_pvc(fit_result, p_vols, te, tr)
```

Arguments

fit_result a fit_result object to apply partial volume correction.

p_vols a numeric vector of partial volumes expressed as percentages. For example, a

voxel containing 100% white matter tissue would use : $p_vols = c(WM = 100)$,

GM = 0, CSF = 0).

te the MRS TE. tr the MRS TR.

Value

a fit_result object with a rescaled results table.

scale_amp_ratio 175

scale_amp_ratio

Scale fitted amplitudes to a ratio of signal amplitude.

Description

Scale fitted amplitudes to a ratio of signal amplitude.

Usage

```
scale_amp_ratio(fit_result, name, use_mean_value = FALSE)
```

Arguments

fit_result a result object generated from fitting.

name the signal name to use as a denominator (usually, "tCr" or "tNAA").

use_mean_value scales the result by the mean of the signal when set to TRUE.

Value

a fit_result object with a rescaled results table.

scale_amp_ratio_value Scale fitted amplitudes to a ratio of signal amplitude.

Description

Scale fitted amplitudes to a ratio of signal amplitude.

Usage

```
scale_amp_ratio_value(fit_result, value)
```

Arguments

fit_result a result object generated from fitting.
value the number use as a denominator.

Value

a fit_result object with a rescaled results table.

176 scale_basis_amp

scale_amp_water_ratio Scale metabolite amplitudes as a ratio to the unsuppressed water amplitude.

Description

Scale metabolite amplitudes as a ratio to the unsuppressed water amplitude.

Usage

```
scale_amp_water_ratio(fit_result, ref_data, ...)
```

Arguments

```
fit_result a result object generated from fitting.
ref_data a water reference MRS data object.
```

... additional arguments to get_td_amp function.

Value

a fit_result object with a rescaled results table.

scale_basis_amp

Scale a basis object by a scalar.

Description

Scale a basis object by a scalar.

Usage

```
scale_basis_amp(basis, amp)
```

Arguments

basis basis_set object to be scaled.

amp multiplicative factor with length 1.

Value

basis_set object multiplied by the amplitude scale factor.

```
scale_basis_from_singlet
```

Scale a basis-set to be consistent with spant assumptions for water scaling.

Description

For correct water scaling, spant assumes the time-domain amplitude (t = 0) for a single proton is 0.5. Internally simulated basis-sets will be correctly scaled, however imported basis-sets should be assumed to be un-scaled and this function should be used. Note that the singlet specified should only contain one resonance, and that any additional signals (eg TSP or residual water) will result in incorrect scaling. Therefore, only simulated basis sets are appropriate for use with this function.

Usage

```
scale_basis_from_singlet(basis, name, protons)
```

Arguments

basis basis set to be scaled.

name the name of the singlet to be used as a scaling reference.

protons the number of MRS visible protons contributing to the singlet resonance.

Value

a scaled basis.

scale_mrs_amp

Scale an mrs_data object by a scalar or vector or amplitudes.

Description

Scale an mrs_data object by a scalar or vector or amplitudes.

Usage

```
scale_mrs_amp(mrs_data, amp)
```

Arguments

mrs_data data to be scaled.

amp multiplicative factor, must have length equal to 1 or Nspec(mrs_data).

Value

mrs_data object multiplied by the amplitude scale factor.

178 sd

scale_spec

Scale mrs_data to a spectral region.

Description

Scale mrs_data to a spectral region.

Usage

```
scale_spec(
  mrs_data,
  xlim = NULL,
  operator = "sum",
  freq_scale = "ppm",
  mode = "re",
  mean_dyns = NULL,
  ret_scale_factor = FALSE
)
```

Arguments

mrs_data MRS data.

xlim spectral range to be integrated (defaults to full range).

operator can be "sum" (default), "mean", "12", "max", "min" or "max-min".

freq_scale units of xlim, can be: "ppm", "Hz" or "points".

mode spectral mode, can be: "re", "im", "mod" or "cplx".

mean_dyns mean the dynamic scans before applying the operator. The same scaling value

will be applied to each individual dynamic.

ret_scale_factor

option to return the scaling factor in addition to the scaled data.

Value

normalised data.

sd

Calculate the standard deviation spectrum from an mrs_data object.

Description

Calculate the standard deviation spectrum from an mrs_data object.

```
sd(x, na.rm)
```

sd.mrs_data 179

Arguments

x object of class mrs_data.
na.rm remove NA values.

Value

sd mrs_data object.

sd.mrs_data

Calculate the standard deviation spectrum from an mrs_data object.

Description

Calculate the standard deviation spectrum from an mrs_data object.

Usage

```
## S3 method for class 'mrs_data'
sd(x, na.rm = FALSE)
```

Arguments

x object of class mrs_data.
na.rm remove NA values.

Value

sd mrs_data object.

seconds

Return a time scale vector to match the FID of an MRS data object.

Description

Return a time scale vector to match the FID of an MRS data object.

Usage

```
seconds(mrs_data)
```

Arguments

mrs_data MRS data.

Value

time scale vector in units of seconds.

seq_cpmg_ideal

CPMG style sequence with ideal pulses.

Description

CPMG style sequence with ideal pulses.

Usage

```
seq_cpmg_ideal(spin_params, ft, ref, TE = 0.03, echoes = 4)
```

Arguments

```
spin_params spin system definition.

ft transmitter frequency in Hz.

ref reference value for ppm scale.

TE echo time in seconds.

echoes number of echoes.
```

Value

list of resonance amplitudes and frequencies.

seq_mega_press_ideal

MEGA-PRESS sequence with ideal localisation pulses and Gaussian shaped editing pulse.

Description

MEGA-PRESS sequence with ideal localisation pulses and Gaussian shaped editing pulse.

```
seq_mega_press_ideal(
    spin_params,
    ft,
    ref,
    ed_freq = 1.89,
    TE1 = 0.015,
    TE2 = 0.053,
    BW = 110,
    steps = 50
)
```

seq_press_2d_shaped 181

Arguments

```
spin system definition.
spin_params
ft
                  transmitter frequency in Hz.
ref
                  reference value for ppm scale.
                  editing pulse frequency in ppm.
ed_freq
TE1
                  TE1 sequence parameter in seconds (TE=TE1+TE2).
TE2
                  TE2 sequence parameter in seconds.
BW
                  editing pulse bandwidth in Hz.
                  number of hard pulses used to approximate the editing pulse.
steps
```

Value

list of resonance amplitudes and frequencies.

seq_press_2d_shaped

PRESS sequence with shaped refocusing pulses.

Description

PRESS sequence with shaped refocusing pulses.

Usage

```
seq_press_2d_shaped(
    spin_params,
    ft,
    ref,
    TE1 = 0.01,
    TE2 = 0.02,
    pulse_file,
    pulse_dur,
    pulse_file_format,
    refoc_flip_angle = 180,
    xy_pulse_ppm = NULL,
    resamp = TRUE,
    fs_resamp = 1e-04
)
```

Arguments

```
spin_params spin system definition.

ft transmitter frequency in Hz.

ref reference value for ppm scale.

TE1 TE1 sequence parameter in seconds (TE=TE1+TE2).
```

seq_press_ideal seq_press_ideal

TE2 TE2 sequence parameter in seconds.

pulse_file path to refocusing pulse file.
pulse_dur refocusing pulse duration.

pulse_file_format

file format for the refocusing pulse.

refoc_flip_angle

refocusing pulse flip angle in degrees (defaults to 180).

xy_pulse_ppm a vector of ppm values for the offset of each sub-simulation.

resamp option to resample the pulse shape.

fs_resamp sampling frequency (Hz) to resample.

Value

list of resonance amplitudes and frequencies.

seq_press_ideal PRESS sequence with ideal pulses.

Description

PRESS sequence with ideal pulses.

Usage

```
seq_press_ideal(spin_params, ft, ref, TE1 = 0.01, TE2 = 0.02)
```

Arguments

spin_params spin system definition.
ft transmitter frequency in Hz.

ref reference value for ppm scale.

TE1 sequence parameter in seconds (TE=TE1+TE2).

TE2 TE2 sequence parameter in seconds.

Value

list of resonance amplitudes and frequencies.

seq_pulse_acquire 183

Description

Simple pulse and acquire sequence with ideal pulses.

Usage

```
seq_pulse_acquire(spin_params, ft, ref, nuc = "1H", acq_delay = 0)
```

Arguments

spin_params spin system definition.

ft transmitter frequency in Hz.

ref reference value for ppm scale.

nuc acquisition nucleus.

acq_delay delay between excitation and acquisition.

Value

list of resonance amplitudes and frequencies.

```
seq_slaser_ideal sLASER sequence with ideal pulses.
```

Description

sLASER sequence with ideal pulses.

Usage

```
seq_slaser_ideal(spin_params, ft, ref, TE1 = 0.008, TE2 = 0.011, TE3 = 0.009)
```

Arguments

spin_params	spin system definition.
ft	transmitter frequency in Hz.
ref	reference value for ppm scale.

TE1 first echo time (between exc. and 1st echo) in seconds.

TE2 second echo time (between 2nd echo and 4th echo) in seconds.

TE3 third echo time (between 4th echo and 5th echo) in seconds.

Value

list of resonance amplitudes and frequencies.

184 seq_steam_ideal

seq_spin_echo_ideal Spin echo sequence with ideal pulses.

Description

Spin echo sequence with ideal pulses.

Usage

```
seq_spin_echo_ideal(spin_params, ft, ref, nuc = "1H", TE = 0.03)
```

Arguments

spin_params spin system definition.

ft transmitter frequency in Hz.

ref reference value for ppm scale.

nuc acquisition nucleus.

TE echo time in seconds.

Value

list of resonance amplitudes and frequencies.

seq_steam_ideal STEAM sequence with ideal pulses.

Description

STEAM sequence with ideal pulses.

Usage

```
seq_steam_ideal(spin_params, ft, ref, TE = 0.03, TM = 0.02, amp_scale = 2)
```

Arguments

spin_params spin system definition.

ft transmitter frequency in Hz.

ref reference value for ppm scale.

TE sequence parameter in seconds.

TM sequence parameter in seconds.

amp_scale amplitude scaling factor. Set to 2 (default) to ensure correct scaling for water

reference scaling. Set to 1 to maintain the inherent loss of signal associated with

STEAM.

seq_steam_ideal_cof 185

Value

list of resonance amplitudes and frequencies.

seq_steam_ideal_cof STEAM sequence with ideal pulses and coherence order filtering to simulate gradient crushers.	seq_steam_ideal_cof	STEAM sequence with ideal pulses and coherence order filtering to simulate gradient crushers.
---	---------------------	---

Description

See Landheer et al NMR Biomed 2021 34(5):e4129 and Landheer et al MRM 2019 Apr;81(4):2209-2222 for more details on the coherence order filtering method.

Usage

```
seq_steam_ideal_cof(spin_params, ft, ref, TE = 0.03, TM = 0.02, amp_scale = 2)
```

Arguments

spin_params	spin system definition.
ft	transmitter frequency in Hz.
ref	reference value for ppm scale.
TE	sequence parameter in seconds.
TM	sequence parameter in seconds.
amp_scale	amplitude scaling factor. Set to 2 (default) to ensure correct scaling for water reference scaling. Set to 1 to maintain the inherent loss of signal associated with STEAM.

Value

list of resonance amplitudes and frequencies.

```
seq_steam_ideal_young STEAM sequence with ideal pulses using the z-rotation gradient simulation method described by Young et al JMR 140, 146-152 (1999).
```

Description

STEAM sequence with ideal pulses using the z-rotation gradient simulation method described by Young et al JMR 140, 146-152 (1999).

set_def_acq_paras

Usage

```
seq_steam_ideal_young(
   spin_params,
   ft,
   ref,
   TE = 0.03,
   TM = 0.02,
   amp_scale = 2
)
```

Arguments

```
spin_params spin system definition.

ft transmitter frequency in Hz.

ref reference value for ppm scale.

TE sequence parameter in seconds.

TM sequence parameter in seconds.

amp_scale amplitude scaling factor. Set to 2 (default) to ensure correct scaling for water reference scaling. Set to 1 to maintain the inherent loss of signal associated with STEAM.
```

Value

list of resonance amplitudes and frequencies.

```
set_def_acq_paras Set the default acquisition parameters.
```

Description

Set the default acquisition parameters.

Usage

```
set_def_acq_paras(
  ft = getOption("spant.def_ft"),
  fs = getOption("spant.def_fs"),
  N = getOption("spant.def_N"),
  ref = getOption("spant.def_ref"),
  nuc = getOption("spant.nuc")
)
```

set_lcm_cmd 187

Arguments

ft	transmitter frequency in Hz.
fs	sampling frequency in Hz.

N number of data points in the spectral dimension.

ref reference value for ppm scale.

nuc resonant nucleus.

set_lcm_cmd

Set the command to run the LCModel command-line program.

Description

Set the command to run the LCModel command-line program.

Usage

```
set_lcm_cmd(cmd)
```

Arguments

cmd	path to binary.
set_lw	Apply line-broadening to an mrs_data object to achieve a specified

linewidth.

Description

Apply line-broadening to an mrs_data object to achieve a specified linewidth.

Usage

```
set_lw(mrs_data, lw, xlim = c(4, 0.5), lg = 1, mask_narrow = TRUE)
```

Arguments

mrs_data data in.

lw target linewidth in units of ppm.

xlim region to search for peaks to obtain a linewidth estimate.

lg Lorentz-Gauss lineshape parameter.

mask_narrow masks spectra where the requested linewidth is too narrow, if set FALSE the

spectra are not changed.

Value

line-broadened data.

set_Ntrans

set_mask_xy_mat

Set the masked voxels in a 2D MRSI dataset to given spectrum.

Description

Set the masked voxels in a 2D MRSI dataset to given spectrum.

Usage

```
set_mask_xy_mat(mrs_data, mask, mask_mrs_data)
```

Arguments

mrs_data MRSI data object.

mask matrix of boolean values specifying the voxels to set, where a value of TRUE

indicates the voxel should be set to mask_mrs_data.

mask_mrs_data the spectral data to be assigned to the masked voxels.

Value

updated dataset.

set_Ntrans

Set the number of transients for an mrs_data object.

Description

Set the number of transients for an mrs_data object.

Usage

```
set_Ntrans(mrs_data, n_trans)
```

Arguments

mrs_data MRS data.

n_trans number of acquired transients.

set_precomp_mode 189

set_precomp_mode

Set the precompute mode.

Description

Set the precompute mode.

Usage

```
set_precomp_mode(mode = NA)
```

Arguments

mode

can be one of: "default", "overwrite", "clean" or "disabled".

set_precomp_verbose

Set the verbosity of the precompute function.

Description

Set the verbosity of the precompute function.

Usage

```
set_precomp_verbose(verbose = NA)
```

Arguments

verbose

can be TRUE or FALSE.

set_ref

Set the ppm reference value (eg ppm value at 0Hz).

Description

Set the ppm reference value (eg ppm value at 0Hz).

Usage

```
set_ref(mrs_data, ref)
```

Arguments

mrs_data

MRS data.

ref

reference value for ppm scale.

set_tqn_cmd

 set_td_pts

Set the number of time-domain data points, truncating or zero-filling as appropriate.

Description

Set the number of time-domain data points, truncating or zero-filling as appropriate.

Usage

```
set_td_pts(mrs_data, pts)
```

Arguments

mrs_data MRS data.

pts number of data points.

Value

MRS data with pts data points.

 set_tqn_cmd

Set the command to run the TARQUIN command-line program.

Description

Set the command to run the TARQUIN command-line program.

Usage

```
set_tqn_cmd(cmd)
```

Arguments

 cmd

path to binary.

set_tr 191

set_tr

Set the repetition time of an MRS dataset.

Description

Set the repetition time of an MRS dataset.

Usage

```
set_tr(mrs_data, tr)
```

Arguments

mrs_data MRS data.

tr repetition time in seconds.

Value

updated mrs_data set.

shift

Apply a frequency shift to MRS data.

Description

Apply a frequency shift to MRS data.

Usage

```
shift(mrs_data, shift, units = "ppm")
```

Arguments

mrs_data MRS data.

shift frequency shift (in ppm by default).

units of the shift ("ppm" or "hz").

Value

frequency shifted MRS data.

sim_basis

shift_basis

Apply frequency shifts to basis set signals.

Description

Apply frequency shifts to basis set signals.

Usage

```
shift_basis(basis, shifts)
```

Arguments

basis the basis to apply the shift to.

shifts a vector of frequency shifts to apply in ppm units. Must be the same length as

there are basis elements, or one value to be applied to all elements.

Value

modified basis set object.

sim_basis

Simulate a basis set object.

Description

Simulate a basis set object.

Usage

```
sim_basis(
  mol_list,
  pul_seq = seq_pulse_acquire,
  acq_paras = def_acq_paras(),
  xlim = NULL,
  auto_scale = FALSE,
  use_basis_cache = FALSE,
  verbose = FALSE,
  ...
)
```

sim_basis_1h_brain 193

Arguments

mol_list	list of mol_parameter objects. Alternatively, a character vector matching molecules may also be provided. Use the get_mol_names function for a full list of molecules.	
pul_seq	pulse sequence function to use.	
acq_paras	list of acquisition parameters or an mrs_data object. See def_acq_paras	
xlim	ppm range limiting signals to be simulated.	
auto_scale	scale the basis based on the intensity of a singlet resonance. Needed for sequences with spatial simulation.	
use_basis_cache		
	create and use a cache of simulated basis sets stored in the "spant_basis_cache" folder in the users home directory. Defults to FALSE.	
verbose	output simulation progress and timings.	
	extra parameters to pass to the pulse sequence function.	

Value

basis object.

sim_basis_1h_brain Simulate a basis-set suitable for 1H brain MRS analysis acquired with a PRESS sequence. Note, ideal pulses are assumed.

Description

Simulate a basis-set suitable for 1H brain MRS analysis acquired with a PRESS sequence. Note, ideal pulses are assumed.

Usage

```
sim_basis_1h_brain(
  pul_seq = seq_press_ideal,
  acq_paras = def_acq_paras(),
  xlim = c(0.5, 4.2),
  lcm_compat = FALSE,
  ...
)
```

Arguments

pul_seq pulse sequence function to use.

acq_paras list of acquisition parameters or an mrs_data object. See def_acq_paras.

xlim range of frequencies to simulate in ppm.

lcm_compat exclude lipid and MM signals for use with default LCModel options.

extra parameters to pass to the pulse sequence function.

Value

basis object.

```
sim_basis_1h_brain_press
```

Simulate a basis-set suitable for 1H brain MRS analysis acquired with a PRESS sequence. Note, ideal pulses are assumed.

Description

Simulate a basis-set suitable for 1H brain MRS analysis acquired with a PRESS sequence. Note, ideal pulses are assumed.

Usage

```
sim_basis_1h_brain_press(
  acq_paras = def_acq_paras(),
  xlim = c(0.5, 4.2),
  lcm_compat = FALSE,
  TE1 = 0.01,
  TE2 = 0.02
)
```

Arguments

acq_paras list of acquisition parameters or an mrs_data object. See def_acq_paras
xlim range of frequencies to simulate in ppm.

lcm_compat exclude lipid and MM signals for use with default LCModel options.

TE1 TE1 of PRESS sequence (TE = TE1 + TE2).

TE2 of PRESS sequence.

Value

basis object.

sim_basis_mm_lip_lcm

Description

Simulate a macromolecular and lipid basis-set suitable for 1H brain MRS analysis.

Usage

```
sim_basis_mm_lip_lcm(acq_paras = def_acq_paras())
```

Arguments

acq_paras

list of acquisition parameters or an mrs_data object. See def_acq_paras

Value

basis object.

sim_basis_tqn

Simulate a basis file using TARQUIN.

Description

Simulate a basis file using TARQUIN.

Usage

```
sim_basis_tqn(
  fs = def_fs(),
  ft = def_ft(),
  N = def_N(),
  ref = def_ref(),
  opts = NULL
)
```

Arguments

```
fs sampling frequency
ft transmitter frequency
N number of data points
ref chemical shift reference
```

opts list of options to pass to TARQUIN.

sim_brain_1h

Examples

```
## Not run:
write_basis_tqn('test.basis',mrs_data,c("--echo","0.04"))
## End(Not run)
```

sim_brain_1h

Simulate MRS data with a similar appearance to normal brain (by default).

Description

Simulate MRS data with a similar appearance to normal brain (by default).

Usage

```
sim_brain_1h(
   acq_paras = def_acq_paras(),
   type = "normal_v2",
   pul_seq = seq_slaser_ideal,
   xlim = c(0.5, 4.2),
   full_output = FALSE,
   amps = NULL,
   basis_lb = NULL,
   zero_lip_mm = FALSE,
   remove_lip_mm = FALSE,
   ...
)
```

Arguments

acq_paras	list of acquisition parameters or an mrs_data object. See def_acq_paras.
type	type of spectrum, only "normal" is implemented currently.
pul_seq	pulse sequence function to use.
xlim	range of frequencies to simulate in ppm.
full_output	when FALSE (default) only output the simulated MRS data. When TRUE output a list containing the MRS data, basis set object and corresponding amplitudes.
amps	a vector of basis amplitudes may be specified to modify the output spectrum.
basis_lb	apply additional Gaussian line-broadening to the basis (Hz).
zero_lip_mm	zero the amplitudes of any lipid or macromolecular components based on their name starting with "MM" or "Lip".
remove_lip_mm	remove any lipid or macromolecular basis components based on their name starting with "MM" or "Lip".

extra parameters to pass to the pulse sequence function.

sim_mol 197

Value

see full_output option.

sim_mol

Simulate a mol_parameter object.

Description

Simulate a mol_parameter object.

Usage

```
sim_mol(
  mol,
  pul_seq = seq_pulse_acquire,
  ft = def_ft(),
  ref = def_ref(),
  fs = def_fs(),
  N = def_N(),
  xlim = NULL,
  ...
)
```

Arguments

```
mol_parameter object.
mol
pul_seq
                  pulse sequence function to use.
ft
                  transmitter frequency in Hz.
ref
                  reference value for ppm scale.
fs
                   sampling frequency in Hz.
Ν
                  number of data points in the spectral dimension.
xlim
                  ppm range limiting signals to be simulated.
                  extra parameters to pass to the pulse sequence function.
. . .
```

Value

```
mrs_data object.
```

sim_noise

sim_noise

Simulate an mrs_data object containing simulated Gaussian noise.

Description

Simulate an mrs_data object containing simulated Gaussian noise.

Usage

```
sim_noise(
    sd = 0.1,
    fs = def_fs(),
    ft = def_ft(),
    N = def_N(),
    ref = def_ref(),
    nuc = def_nuc(),
    dyns = 1,
    fd = TRUE
)
```

Arguments

sd	standard deviation of the noise.
fs	sampling frequency in Hz.
ft	transmitter frequency in Hz.
N	number of data points in the spectral dimension.
ref	reference value for ppm scale.
nuc	resonant nucleus.
dyns	number of dynamic scans to generate.
fd	return data in the frequency-domain (TRUE) or time-domain (FALSE)

Value

mrs_data object.

sim_resonances 199

sim_resonances

Simulate a MRS data object containing a set of simulated resonances.

Description

Simulate a MRS data object containing a set of simulated resonances.

Usage

```
sim_resonances(
  freq = 0,
  amp = 1,
  lw = 0,
  lg = 0,
  phase = 0,
  freq_ppm = TRUE,
  acq_paras = def_acq_paras(),
  fp_scale = TRUE,
  back_extrap_pts = 0,
  sum_resonances = TRUE
)
```

Arguments

freq resonance frequency. resonance amplitude. amp line width in Hz. 1w Lorentz-Gauss lineshape parameter (between 0 and 1). lg phase in degrees. phase freq_ppm frequencies are given in ppm units if set to TRUE, otherwise Hz are assumed. list of acquisition parameters. See def_acq_paras acq_paras fp_scale multiply the first data point by 0.5. back_extrap_pts number of data points to back extrapolate. sum_resonances sum all resonances (default is TRUE), otherwise return a dynamic mrs_data object.

Value

MRS data object.

Examples

```
sim_data <- sim_resonances(freq = 2, lw = 5)</pre>
```

200 sim_zero

sim_th_excit_profile Simulate an ideal pulse excitation profile by smoothing a top-hat function with a Gaussian.

Description

Simulate an ideal pulse excitation profile by smoothing a top-hat function with a Gaussian.

Usage

```
sim_th_excit_profile(bw = 1500, sigma = 50, fa = 180)
```

Arguments

bw top-hat bandwidth (Hz).
sigma Gaussian width smoothing parameter (Hz).
fa intended flip angle of the pulse.

Value

data frame containing the frequency scale, excitation profile and corresponding flip-angles.

sim_zero

Simulate an mrs_data object containing complex zero valued samples.

Description

Simulate an mrs_data object containing complex zero valued samples.

Usage

```
sim_zero(
   fs = def_fs(),
   ft = def_ft(),
   N = def_N(),
   ref = def_ref(),
   nuc = def_nuc(),
   dyns = 1
)
```

smooth_dyns 201

Arguments

fs sampling frequency in Hz.

ft transmitter frequency in Hz.

N number of data points in the spectral dimension.

ref reference value for ppm scale.

nuc resonant nucleus.

dyns number of dynamic scans to generate.

Value

mrs_data object.

smooth_dyns

Smooth data across the dynamic dimension with a Gaussian kernel.

Description

Smooth data across the dynamic dimension with a Gaussian kernel.

Usage

```
smooth_dyns(mrs_data, sigma)
```

Arguments

mrs_data data to be smoothed.

sigma standard deviation of the underlying Gaussian kernel in seconds.

Value

smoothed mrs_data object.

sort_basis

Sort the basis-set elements alphabetically.

Description

Sort the basis-set elements alphabetically.

Usage

```
sort_basis(basis)
```

Arguments

basis

input basis.

Value

sorted basis.

spant_abfit_benchmark Simulate and fit some spectra with ABfit for benchmarking purposes.

Basic timing and performance metrics will be printed.

Description

Simulate and fit some spectra with ABfit for benchmarking purposes. Basic timing and performance metrics will be printed.

Usage

```
spant_abfit_benchmark(noise_reps = 10, return_res = FALSE, opts = abfit_opts())
```

Arguments

noise_reps number of spectra to fit with differing noise samples.

return_res return a list of fit_result objects.

opts ABfit options structure.

spant_mpress_drift 203

spant_mpress_drift

Example MEGA-PRESS data with significant B0 drift.

Description

Example MEGA-PRESS data with significant B0 drift.

Usage

```
spant_mpress_drift
```

Format

An object of class mrs_data of dimension 1 x 1 x 1 x 1 x 40 x 1 x 1024.

```
spant_simulation_benchmark
```

Simulate a typical metabolite basis set for benchmarking. Timing metrics will be printed on completion.

Description

Simulate a typical metabolite basis set for benchmarking. Timing metrics will be printed on completion.

Usage

```
spant_simulation_benchmark(sim_reps = 10, N = 1024)
```

Arguments

sim_reps number of times to simulate the basis set.

N number of FID data points to simulate.

204 spec_decomp

```
spant_sim_fmrs_dataset
```

Simulate an example fMRS dataset for a block design fMRS experiment and export a BIDS structure.

Description

Simulate an example fMRS dataset for a block design fMRS experiment and export a BIDS structure.

Usage

```
spant_sim_fmrs_dataset(output_dir = NULL)
```

Arguments

output_dir output directory for the BIDS data. Defaults to: "HOME/sim_fmrs_dataset/data".

spec_decomp

Decompose an mrs_data object into white and gray matter spectra.

Description

An implementation of the method published by Goryawala et al MRM 79(6) 2886-2895 (2018). "Spectral decomposition for resolving partial volume effects in MRSI".

Usage

```
spec_decomp(mrs_data, wm, gm, norm_fractions = TRUE)
```

Arguments

mrs_data data to be decomposed into white and gray matter spectra.

wm vector of white matter contributions to each voxel.
gm vector of gray matter contributions to each voxel.

norm_fractions option to normalise the wm, gm vectors for each voxel.

Value

a list of two mrs_data objects corresponding to the two tissue types.

spec_op 205

spec_op

Perform a mathematical operation on a spectral region.

Description

Perform a mathematical operation on a spectral region.

Usage

```
spec_op(
  mrs_data,
  xlim = NULL,
  operator = "sum",
  freq_scale = "ppm",
  mode = "re"
)
```

Arguments

```
mrs_data MRS data.

xlim spectral range to be integrated (defaults to full range).

operator can be "sum" (default), "mean", "l2", "max", "max_cplx, "min" or "max-min".

freq_scale units of xlim, can be : "ppm", "hz" or "points".

mode spectral mode, can be : "re", "im", "mod" or "cplx".
```

Value

an array of integral values.

spin_sys

Create a spin system object for pulse sequence simulation.

Description

Create a spin system object for pulse sequence simulation.

Usage

```
spin_sys(spin_params, ft, ref, precomp_jc_H = NULL, precomp_Iz = NULL)
```

206 spm_pve2categorical

Arguments

spin_params an object describing the spin system properties.

ft transmitter frequency in Hz.

ref reference value for ppm scale.

precomp_jc_H use a precomputed J-coupling H matrix to save time.

precomp_Iz use precomputed Iz matrices to save time.

Value

spin system object.

spm_pve2categorical

Convert SPM style segmentation files to a single categorical image where the numerical values map as: 0) Other, 1) CSF, 2) GM and 3) WM.

Description

Convert SPM style segmentation files to a single categorical image where the numerical values map as: 0) Other, 1) CSF, 2) GM and 3) WM.

Usage

```
spm_pve2categorical(fname)
```

Arguments

fname any of the segmentation files (eg c1_MY_T1.nii).

Value

nifti object.

ssp 207

ssp

Signal space projection method for lipid suppression.

Description

Signal space projection method as described in: Tsai SY, Lin YR, Lin HY, Lin FH. Reduction of lipid contamination in MR spectroscopy imaging using signal space projection. Magn Reson Med 2019 Mar;81(3):1486-1498.

Usage

```
ssp(mrs_data, comps = 5, xlim = c(1.5, 0.8))
```

Arguments

mrs_data MRS data object.

comps the number of spatial components to use.

xlim spectral range (in ppm) covering the lipid signals.

Value

lipid suppressed mrs_data object.

stackplot

Produce a plot with multiple traces.

Description

Produce a plot with multiple traces.

Usage

```
stackplot(x, ...)
```

Arguments

x object for plotting.

... arguments to be passed to methods.

208 stackplot.fit_result

Description

Plot the fitting results of an object of class fit_result with individual basis set components shown.

Usage

```
## S3 method for class 'fit_result'
stackplot(
  х,
 xlim = NULL,
 y_offset = 0,
 dyn = 1,
 x_pos = 1,
 y_pos = 1,
  z_pos = 1,
  coil = 1,
 n = NULL,
  sub_bl = FALSE,
 labels = FALSE,
  label_names = NULL,
  sig_col = "black",
  restore_def_par = TRUE,
  omit_signals = NULL,
  combine_lipmm = FALSE,
  combine_metab = FALSE,
 mar = NULL,
  show_grid = TRUE,
  grid_nx = NULL,
  grid_ny = NA,
  invert_fit = FALSE,
)
```

Arguments

```
x fit_result object.

xlim the range of values to display on the x-axis, eg xlim = c(4,1).

y_offset separate basis signals in the y-axis direction by this value.

dyn the dynamic index to plot.

x_pos the x index to plot.

y_pos the y index to plot.
```

stackplot.mrs_data 209

the z index to plot.

Z_p05	the 2 mack to plot.
coil	the coil element number to plot.
n	single index element to plot (overrides other indices when given).
sub_bl	subtract the baseline from the data and fit (logical).
labels	print signal labels at the right side of the plot.
label_names	provide a character vector of signal names to replace the defaults determined from the basis set.
sig_col	colour of individual signal components.
restore_def_par	•
	restore default plotting par values after the plot has been made.
omit_signals	a character vector of basis signal names to be removed from the plot.
combine_lipmm	combine all basis signals with names starting with "Lip" or "MM".
combine_metab	combine all basis signals with names not starting with "Lip" or "MM".
mar	option to adjust the plot margins. See ?par.
show_grid	plot gridlines behind the data (logical). Defaults to TRUE.
grid_nx	number of cells of the grid in x and y direction. When NULL the grid aligns with the tick marks on the corresponding default axis (i.e., tickmarks as computed by axTicks). When NA, no grid lines are drawn in the corresponding direction.
grid_ny	as above.
invert_fit	show the fit result "upside-down"/
• • •	further arguments to plot method.

stackplot.mrs_data

Stackplot plotting method for objects of class mrs_data.

Description

z_pos

Stackplot plotting method for objects of class mrs_data.

Usage

```
## S3 method for class 'mrs_data'
stackplot(
    x,
    xlim = NULL,
    mode = "re",
    x_units = NULL,
    fd = TRUE,
    col = NULL,
    alpha = NULL,
    x_offset = 0,
    y_offset = 0,
```

210 stackplot.mrs_data

```
plot_dim = NULL,
 x_pos = NULL,
 y_pos = NULL,
 z_{pos} = NULL,
 dyn = 1,
 coil = 1,
 bty = NULL,
 labels = NULL,
 lab\_cex = 1,
 bl_1ty = NULL,
 restore\_def\_par = TRUE,
  show_grid = NULL,
 grid_nx = NULL,
 grid_ny = NA,
 lwd = NULL,
 vline = NULL,
 vline_lty = 2,
 vline_col = "red",
 mar = NULL,
)
```

Arguments

X	object of class mrs_data.
xlim	the range of values to display on the x-axis, eg xlim = $c(4,1)$.
mode	representation of the complex numbers to be plotted, can be one of: "re", "im", "mod" or "arg".
x_units	the units to use for the x-axis, can be one of: "ppm", "hz", "points" or "seconds".
fd	display data in the frequency-domain (default), or time-domain (logical).
col	set the colour of the line, eg col = $rgb(1, 0, 0, 0.5)$.
alpha	set the line transparency, eg alpha = 0.5 is 50% transparency. Overrides any transparency levels set by col.
x_offset	separate plots in the x-axis direction by this value. Default value is 0.
y_offset	separate plots in the y-axis direction by this value.
plot_dim	the dimension to display on the y-axis, can be one of: "dyn", "x", "y", "z", "coil" or NULL. If NULL (the default) all spectra will be collapsed into the dynamic dimension and displayed.
x_pos	the x index to plot.
y_pos	the y index to plot.
z_pos	the z index to plot.
dyn	the dynamic index to plot.
coil	the coil element number to plot.
bty	option to draw a box around the plot. See ?par.

sub_first_dyn 211

labels add labels to each data item.

lab_cex label size.

bl_lty linetype for the y = 0 baseline trace. A default value NULL results in no baseline

being plotted.

restore_def_par

restore default plotting par values after the plot has been made.

show_grid plot gridlines behind the data (logical). Defaults to TRUE.

grid_nx number of cells of the grid in x and y direction. When NULL the grid aligns with

the tick marks on the corresponding default axis (i.e., tickmarks as computed by axTicks). When NA, no grid lines are drawn in the corresponding direction.

grid_ny as above.

lwd plot linewidth.

vline x-value to draw a vertical line.
vline_lty linetype for the vertical line.
vline_col colour for the vertical line.

mar option to adjust the plot margins. See ?par.

... other arguments to pass to the matplot method.

sub_first_dyn

Subtract the first dynamic spectrum from a dynamic series.

Description

Subtract the first dynamic spectrum from a dynamic series.

Usage

```
sub_first_dyn(mrs_data, scale = 1)
```

Arguments

mrs_data dynamic MRS data.

scale scale factor for the first spectrum.

Value

subtracted data.

212 sub_median_dyns

sub_mean_dyns

Subtract the mean dynamic spectrum from a dynamic series.

Description

Subtract the mean dynamic spectrum from a dynamic series.

Usage

```
sub_mean_dyns(mrs_data, scale = 1)
```

Arguments

mrs_data

dynamic MRS data.

scale

scale factor for the mean spectrum.

Value

subtracted data.

sub_median_dyns

Subtract the median dynamic spectrum from a dynamic series.

Description

Subtract the median dynamic spectrum from a dynamic series.

Usage

```
sub_median_dyns(mrs_data, scale = 1)
```

Arguments

mrs_data

dynamic MRS data.

scale

scale factor for the medium spectrum.

Value

subtracted data.

sum_coils 213

sum_coils

Calculate the sum across receiver coil elements.

Description

Calculate the sum across receiver coil elements.

Usage

```
sum_coils(mrs_data)
```

Arguments

mrs_data

MRS data split across receiver coil elements.

Value

sum across coil elements.

sum_dyns

Calculate the sum of data dynamics.

Description

Calculate the sum of data dynamics.

Usage

```
sum_dyns(mrs_data)
```

Arguments

mrs_data

dynamic MRS data.

Value

sum of data dynamics.

214 sum_mrs_list

sum_mrs

Sum two mrs_data objects.

Description

Sum two mrs_data objects.

Usage

```
sum_mrs(a, b, force = FALSE)
```

Arguments

a first mrs_data object to be summed.

b second mrs_data object to be summed.

force set to TRUE to force mrs_data objects to be summed, even if they are in different

time/frequency domains.

Value

a + b

 ${\tt sum_mrs_list}$

Return the sum of a list of mrs_data objects.

Description

Return the sum of a list of mrs_data objects.

Usage

```
sum_mrs_list(mrs_list)
```

Arguments

mrs_list

list of mrs_data objects.

Value

sum mrs_data object.

svs_1h_brain_analysis 215

svs_1h_brain_analysis Standard SVS 1H brain analysis pipeline.

Description

Standard SVS 1H brain analysis pipeline.

Usage

```
svs_1h_brain_analysis(
 metab,
 basis = NULL,
 w_ref = NULL,
 mri_seg = NULL,
 mri = NULL,
 output_dir = NULL,
  extra = NULL,
  decimate = NULL,
  rats_corr = TRUE,
  ecc = FALSE,
  comb_dyns = TRUE,
  hsvd_filt = FALSE,
  scale\_amps = TRUE,
  te = NULL,
  tr = NULL,
  preproc_only = FALSE,
 method = "ABFIT",
  opts = NULL
)
```

Arguments

metab	filepath or mrs_data object containing MRS metabolite data.
basis	basis set object to use for analysis.
w_ref	filepath or mrs_data object containing MRS water reference data.
mri_seg	filepath or nifti object containing segmented MRI data.
mri	filepath or nifti object containing anatomical MRI data.
output_dir	directory path to output fitting results.
extra	data.frame with one row containing additional information to be attached to the fit results table.
decimate	option to decimate the input data by a factor of two. The default value of NULL does not perform decimation unless the spectral width is greater than $20\ PPM$.
rats_corr	option to perform rats correction, defaults to TRUE.
ecc	option to perform water reference based eddy current correction, defaults to FALSE.

option to combine dynamic scans, defaults to TRUE. comb_dyns hsvd_filt option to apply hsvd water removal, defaults to FALSE. option to scale metabolite amplitude estimates, defaults to TRUE. scale_amps metabolite mrs data echo time in seconds. tr metabolite mrs data repetition time in seconds. preproc_only only perform the preprocessing steps and omit fitting. The preprocessed metabolite data will be returned in this case. method analysis method to use, see fit_mrs help. opts options to pass to the analysis method.

Value

a fit_result or mrs_data object depending on the preproc_only option.

```
svs_1h_brain_analysis_dev
Standard SVS 1H brain analysis pipeline.
```

Description

Note this function is still under development and liable to changes.

Usage

```
svs_1h_brain_analysis_dev(
 metab,
 w_ref = NULL,
  output_dir = NULL,
 basis = NULL,
 p_vols = NULL,
  append_basis = NULL,
  remove_basis = NULL,
 dfp_corr = FALSE,
  omit_bad_dynamics = FALSE,
  te = NULL,
  tr = NULL,
  output_ratio = "tCr",
  ecc = FALSE,
 abfit_opts = NULL,
  verbose = FALSE
)
```

Arguments

metab filepath or mrs_data object containing MRS metabolite data. w_ref filepath or mrs_data object containing MRS water reference data. output_dir directory path to output fitting results. precompiled basis set object to use for analysis. basis a numeric vector of partial volumes expressed as percentages. Defaults to 100% p_vols white matter. A voxel containing 100% gray matter tissue would use : p_vols = c(WM = 0, GM = 100, CSF = 0).append_basis names of extra signals to add to the default basis. Eg append_basis = c("peth","cit"). Cannot be used with precompiled basis sets. remove_basis names of signals to remove from the basis. Cannot be used with precompiled basis sets. dfp_corr perform dynamic frequency and phase correction using the RATS method. omit_bad_dynamics detect and remove bad dynamics. te metabolite mrs data echo time in seconds. If not supplied this will be guessed from the metab data file. metabolite mrs data repetition time in seconds. If not supplied this will be tr guessed from the metab data file. output_ratio optional string to specify a metabolite ratio to output. Defaults to "tCr" and multiple metabolites may be specified for multiple outputs. Set as NULL to omit. option to perform water reference based eddy current correction, defaults to ecc FALSE. options to pass to ABfit. abfit_opts verbose output potentially useful information.

Examples

```
svs_1h_brain_batch_analysis
```

Batch interface to the standard SVS 1H brain analysis pipeline.

Description

Batch interface to the standard SVS 1H brain analysis pipeline.

Usage

```
svs_1h_brain_batch_analysis(
  metab_list,
  w_ref_list = NULL,
  mri_seg_list = NULL,
  mri_list = NULL,
  output_dir_list = NULL,
  extra = NULL,
  ...
)
```

Arguments

metab_list	list of file paths or mrs_data objects containing MRS metabolite data.	
w_ref_list	list of file paths or mrs_data objects containing MRS water reference data.	
mri_seg_list	list of file paths or nifti objects containing segmented MRI data.	
mri_list	list of file paths or nifti objects containing anatomical MRI data.	
output_dir_list		
	list of directory paths to output fitting results.	
extra	a data frame with the same number of rows as metab_list, containing additional information to be attached to the fit results table.	
	additional options to be passed to the svs_1h_brain_analysis function.	

Value

a list of fit_result objects.

sv_res_table 219

sv_res_table

Output a table of fit amplitudes and error estimates for a single-voxel fit.

Description

Output a table of fit amplitudes and error estimates for a single-voxel fit.

Usage

```
sv_res_table(fit_res, format_out = FALSE)
```

Arguments

fit_res

input vector.

format_out

reduce the accuracy of values to aid table formatting.

Value

data.frame of values.

td2fd

Transform time-domain data to the frequency-domain.

Description

Transform time-domain data to the frequency-domain.

Usage

```
td2fd(mrs_data)
```

Arguments

mrs_data

MRS data in time-domain representation.

Value

MRS data in frequency-domain representation.

220 td_conv_filt

tdsr Tim	e-domain spectral registration.
----------	---------------------------------

Description

An implementation of the method published by Near et al MRM 73:44-50 (2015).

Usage

```
tdsr(mrs\_data, ref = NULL, xlim = c(4, 0.5), max\_t = 0.2)
```

Arguments

mrs_data	MRS data to be corrected.
ref	optional MRS data to use as a reference, the mean of all dynamics is used if this argument is not supplied.
xlim	optional frequency range to perform optimisation, set to NULL to use the full range.
max_t	truncate the FID when longer than max_t to reduce time taken.

Value

a list containing the corrected data; phase and shift values in units of degrees and Hz respectively.

td_conv_filt	td_conv_filt	Time-domain convolution based filter.	
--------------	--------------	---------------------------------------	--

Description

Time-domain convolution based filter described by: Marion D, Ikura M, Bax A. Improved solvent suppression in one-dimensional and twodimensional NMR spectra by convolution of time-domain data. J Magn Reson 1989;84:425-430.

Usage

```
td_conv_filt(mrs_data, K = 25, ext = 1)
```

Arguments

mrs_data	MRS data to be filtered.
K	window width in data points.
ext	point separation for linear extrapolation.

te 221

te

Return the echo time of an MRS dataset.

Description

Return the echo time of an MRS dataset.

Usage

```
te(mrs_data)
```

Arguments

mrs_data

MRS data.

Value

echo time in seconds.

tr

Return the repetition time of an MRS dataset.

Description

Return the repetition time of an MRS dataset.

Usage

```
tr(mrs_data)
```

Arguments

mrs_data

MRS data.

Value

repetition time in seconds.

222 varpro_3_para_opts

t_test_spec

Perform a t-test on spectral data points.

Description

Perform a t-test on spectral data points.

Usage

```
t_test_spec(mrs_data, group)
```

Arguments

```
mrs_data object with spectra in the dynamic dimension.
```

group vector describing the group membership of each dynamic spectrum.

Value

a list of statistical results.

varpro_3_para_opts

Return a list of options for VARPRO based fitting with 3 free parameters.

Description

Return a list of options for VARPRO based fitting with 3 free parameters.

Usage

```
varpro_3_para_opts(
  nstart = 20,
  init_damping = 2,
  maxiters = 200,
  max_shift = 5,
  max_damping = 5,
  anal_jac = FALSE,
  bl_smth_pts = 80
)
```

varpro_basic_opts 223

Arguments

nstart position in the time-domain to start fitting, units of data points.

init_damping starting value for the global Gaussian line-broadening term - measured in Hz.

maxiters maximum number of levmar iterations to perform.

max_shift maximum global shift allowed, measured in Hz.

max_damping maximum damping allowed, FWHM measured in Hz.

anal_jac option to use the analytic or numerical Jacobian (logical).

bl_smth_pts number of data points to use in the baseline smoothing calculation.

Value

list of options.

varpro_basic_opts

Return a list of options for a basic VARPRO analysis.

Description

Return a list of options for a basic VARPRO analysis.

Usage

```
varpro_basic_opts(method = "fd_re", nnls = TRUE, ppm_left = 4, ppm_right = 0.2)
```

Arguments

method one of "td", "fd", "fd_re".

nnls restrict basis amplitudes to non-negative values.

ppm_left downfield frequency limit for the fitting range (ppm).

ppm_right upfield frequency limit for the fitting range (ppm).

Value

full list of options.

224 varpro_opts

varpro_opts

Return a list of options for VARPRO based fitting.

Description

Return a list of options for VARPRO based fitting.

Usage

```
varpro_opts(
  nstart = 20,
  init_g_damping = 2,
  maxiters = 200,
  max_shift = 5,
  max_g_damping = 5,
  max_ind_damping = 5,
  anal_jac = TRUE,
  bl_smth_pts = 80
)
```

Arguments

nstart position in the time-domain to start fitting, units of data points. init_g_damping starting value for the global Gaussian line-broadening term - measured in Hz. maxiters maximum number of levmar iterations to perform. max_shift maximum shift allowed to each element in the basis set, measured in Hz. maximum permitted global Gaussian line-broadening. max_g_damping max_ind_damping maximum permitted Lorentzian line-broadening for each element in the basis set, measured in Hz. anal_jac option to use the analytic or numerical Jacobian (logical). bl_smth_pts number of data points to use in the baseline smoothing calculation.

Value

list of options.

Examples

```
varpro_opts(nstart = 10)
```

vec2mrs_data 225

vec2mrs_data

Convert a vector into a mrs_data object.

Description

Convert a vector into a mrs_data object.

Usage

```
vec2mrs_data(
  vec,
  mrs_data = NULL,
  fs = NULL,
  ft = NULL,
  ref = NULL,
  nuc = NULL,
  dyns = 1,
  fd = FALSE
)
```

Arguments

vec	the data vector.
mrs_data	example data to copy acquisition parameters from.
fs	sampling frequency in Hz.
ft	transmitter frequency in Hz.
ref	reference value for ppm scale.
nuc	resonant nucleus.
dyns	replicate the data across the dynamic dimension.
fd	flag to indicate if the vector is in the frequency domain (logical).

Value

mrs_data object.

226 write_basis_tqn

write_basis

Write a basis object to an LCModel .basis formatted file.

Description

Write a basis object to an LCModel .basis formatted file.

Usage

```
write_basis(basis, basis_file, fwhmba = 0.1)
```

Arguments

basis basis object to be exported.
basis_file path to basis file to be generated.
fwhmba parameter used by LCModel.

write_basis_tqn

Generate a basis file using TARQUIN.

Description

Generate a basis file using TARQUIN.

Usage

```
write_basis_tqn(basis_file, metab_data, opts = NULL)
```

Arguments

basis_file filename of the basis file to be generated.

metab_data MRS data object to match the generated basis parameters.

opts list of options to pass to TARQUIN.

Examples

```
## Not run:
write_basis_tqn('test.basis',mrs_data,c("--echo","0.04"))
## End(Not run)
```

write_mrs 227

write_mrs

Write MRS data object to file.

Description

Write MRS data object to file.

Usage

```
write_mrs(mrs_data, fname, format = NULL, force = FALSE)
```

Arguments

mrs_data object to be written to file, or list of mrs_data objects.

fname one or more filenames to output.

format string describing the data format. Must be one of the following: "nifti", "dpt",

"lcm_raw", "rds". If not specified, the format will be guessed from the filename

extension.

force set to TRUE to overwrite any existing files.

write_mrs_nifti

Write MRS data object to file in NIFTI format.

Description

Write MRS data object to file in NIFTI format.

Usage

```
write_mrs_nifti(mrs_data, fname)
```

Arguments

mrs_data object to be written to file.

fname the filename of the output NIFTI MRS data.

228 zero_fade_spec

write_pulse_ascii	Write an ASCII formatted pulse file.
WI I CC_PUISC_USCII	Write an Hiself formatica pulse file

Description

Write an ASCII formatted pulse file.

Usage

```
write_pulse_ascii(pulse, path)
```

Arguments

pulse	pulse data object.
path	file path for export.

zero_fade_spec Fade a spectrum to zero by frequency domain multiplication with a

tanh function. Note this operation distorts data points at the end of the

FID.

Description

Fade a spectrum to zero by frequency domain multiplication with a tanh function. Note this operation distorts data points at the end of the FID.

Usage

```
zero_fade_spec(mrs_data, start_ppm, end_ppm)
```

Arguments

mrs_data data to be faded.

start_ppm start point of the fade in ppm units.
end_ppm end point of the fade in ppm units.

Value

modified mrs_data object.

zero_higher_orders 229

zero	higher	_orders

Zero all coherences including and above a given order.

Description

Zero all coherences including and above a given order.

Usage

```
zero_higher_orders(sys, rho, order)
```

Arguments

sys spin system object.
rho density matrix.

order states higher than or equal to this argument will be set to zero.

Value

density matrix.

zero_td_pts_end

Set mrs_data object data points at the end of the FID to zero.

Description

Set mrs_data object data points at the end of the FID to zero.

Usage

```
zero_td_pts_end(mrs_data, pts)
```

Arguments

mrs_data MRS data.

pts number of end points to set to zero.

Value

modified mrs_data object.

230 zf_xy

zf

Zero-fill MRS data in the time domain.

Description

Zero-fill MRS data in the time domain.

Usage

```
zf(x, factor = 2, offset = 0)
## S3 method for class 'list'
zf(x, factor = 2, offset = 0)
## S3 method for class 'mrs_data'
zf(x, factor = 2, offset = 0)
## S3 method for class 'basis_set'
zf(x, factor = 2, offset = 0)
```

Arguments

x input mrs_data or basis_set object.

factor zero-filling factor, factor of 2 returns a dataset with twice the original data points.

offset number of points from the end of the FID to insert the zero values.

Value

zero-filled data.

zf_xy

Zero-fill MRSI data in the k-space x-y direction.

Description

Zero-fill MRSI data in the k-space x-y direction.

Usage

```
zf_xy(mrs_data, factor = 2)
```

Arguments

mrs_data MRSI data.

factor zero-filling factor, a factor of 2 returns a dataset with twice the original points in

the x-y directions. Factors smaller than one are permitted, such that a factor of

0.5 returns half the k-space points in the x-y directions.

zf_xy 231

Value

zero-filled data.
