# Package 'dfidx'

August 22, 2024

Version 0.1-0
<b>Date</b> 2024-08-22
Title Indexed Data Frames
<b>Depends</b> R (>= 3.5.0)
Imports dplyr, Formula, vctrs, pillar, glue, Rdpack, tidyselect
Suggests knitr, quarto
<b>Description</b> Provides extended data frames, with a special data frame column which contains two indexes, with potentially a nesting structure.
License GPL (>= 2)
<pre>URL https://cran.r-project.org/package=dfidx</pre>
VignetteBuilder quarto
RoxygenNote 7.3.1
Encoding UTF-8
LazyData true
RdMacros Rdpack
NeedsCompilation no
Author Yves Croissant [aut, cre]
Maintainer Yves Croissant < yves.croissant@univ-reunion.fr>

2 dfidx

Index 13

dfidx Data frames with indexes

# Description

data frames for which observations are defined by two (potentialy nested) indexes and for which series have thefore a natural tabular representation

# Usage

```
dfidx(
  data,
  idx = NULL,
  drop.index = TRUE,
  as.factor = NULL,
 pkg = NULL,
  fancy.row.names = FALSE,
  subset = NULL,
  idnames = NULL,
  shape = c("long", "wide"),
  choice = NULL,
  varying = NULL,
  sep = ".",
  opposite = NULL,
  levels = NULL,
  ranked = FALSE,
 name,
 position,
)
```

# **Arguments**

data	a data frame	
idx	an index	
drop.index	if TRUE (the default), remove the index series from the data.frame as stand alone series	
as.factor	should the indexes be coerced to factors?	
pkg	if set, the resulting dfidx object is of class $c("dfidx\_pkg", "dfidx")$ which enables to write specific classes	
fancy.row.names		
	if TRUE, fancy row names are computed	
subset	a logical which defines a subset of rows to return	
idnames	the names of the indexes	

dfidx 3

shape either wide or long choice the choice

varying, sep relevant for data sets in wide format, these arguments are passed to reshape

opposite return the opposite of the series
levels the levels for the second index
ranked a boolean for ranked data
name name of the idx column
position position of the idx column

... further arguments

#### **Details**

Indexes are stored as a data. frame column in the resulting dfidx object

#### Value

```
an object of class "dfidx"
```

#### Author(s)

Yves Croissant

#### **Examples**

```
# the first two columns contain the index
mn <- dfidx(munnell)</pre>
# explicitely indicate the two indexes using either a vector or a
# list of two characters
mn <- dfidx(munnell, idx = c("state", "year"))</pre>
mn <- dfidx(munnell, idx = list("state", "year"))</pre>
# rename one or both indexes
mn <- dfidx(munnell, idnames = c(NA, "period"))</pre>
# for balanced data (with observations ordered by the first, then
# by the second index
# use the name of the first index
mn <- dfidx(munnell, idx = "state", idnames = c("state", "year"))</pre>
# or an integer equal to the cardinal of the first index
mn <- dfidx(munnell, idx = 48, idnames = c("state", "year"))</pre>
# Indicate the values of the second index using the levels argument
mn <- dfidx(munnell, idx = 48, idnames = c("state", "year"),</pre>
            levels = 1970:1986)
# Nesting structure for one of the index
```

4 dplyr

dplyr

Methods for dplyr verbs

# **Description**

methods of dplyr verbs for dfidx objects. Default functions don't work because most of these functions returns either a tibble or a data.frame but not a dfidx

#### Usage

```
## S3 method for class 'dfidx'
arrange(.data, ...)
## S3 method for class 'dfidx'
filter(.data, ...)
## S3 method for class 'dfidx'
slice(.data, ...)
## S3 method for class 'dfidx'
mutate(.data, ...)
## S3 method for class 'dfidx'
transmute(.data, ...)
## S3 method for class 'dfidx'
select(.data, ...)
```

# Arguments

```
.data a dfidx object,... further arguments
```

#### **Details**

These methods always return the data frame column that contains the indexes and return a dfidx object.

idx 5

#### Value

```
an object of class "dfidx"
```

# Author(s)

Yves Croissant

# **Examples**

```
mn <- dfidx(munnell)
select(mn, - gsp, - water)
mutate(mn, lgsp = log(gsp), lgsp2 = lgsp ^ 2)
transmute(mn, lgsp = log(gsp), lgsp2 = lgsp ^ 2)
arrange(mn, desc(unemp), labor)
filter(mn, unemp > 10)
pull(mn, gsp)
slice(mn, c(1:2, 5:7))
```

idx

Index for dfidx

#### **Description**

The index of a dfidx is a data.frame containing the different series which define the two indexes (with possibly a nesting structure). It is stored as a "sticky" data.frame column of the data.frame and is also inherited by series (of class 'xseries') which are extracted from a dfidx.

```
idx(x, n = NULL, m = NULL)
## S3 method for class 'dfidx'
idx(x, n = NULL, m = NULL)
## S3 method for class 'idx'
idx(x, n = NULL, m = NULL)
## S3 method for class 'xseries'
idx(x, n = NULL, m = NULL)
## S3 method for class 'idx'
format(x, size = 4, ...)
```

6 idx\_name

# **Arguments**

X	a dfidx or a xseries
n, m	n is the index to be extracted (1 or 2), m equal to one to get the index, greater than one to get a nesting variable.
size	the number of characters of the indexes for the format method
• • •	further arguments (for now unused)

# **Details**

idx is defined as a generic with a dfidx and a xseries method.

#### Value

a data. frame containing the indexes or a series if a specific index is selected

#### Author(s)

Yves Croissant

### **Examples**

```
mn <- dfidx(munnell, idx = c(region = "state", president = "year"))
idx(mn)
gsp <- mn$gsp
idx(gsp)
# get the first index
idx(mn, 1)
# get the nesting variable of the first index
idx(mn, 1, 2)</pre>
```

idx\_name

Get the names of the indexes

# **Description**

This function extract the names of the indexes or the name of a specific index

```
idx_name(x, n = 1, m = NULL)
## S3 method for class 'dfidx'
idx_name(x, n = NULL, m = NULL)
## S3 method for class 'idx'
idx_name(x, n = NULL, m = NULL)
## S3 method for class 'xseries'
idx_name(x, n = NULL, m = NULL)
```

methods.dfidx 7

# Arguments

```
x a dfidx, a idx or a xseries object

n the index to be extracted (1 or 2, ignoring the nesting variables)

m if > 1, a nesting variable
```

#### Value

if n is NULL, a named integer which gives the position of the idx column in the dfidx object, otherwise, a character of length 1

#### Author(s)

Yves Croissant

# **Examples**

```
mn <- dfidx(munnell, idx = c(region = "state", president = "year"))
# get the position of the idx column
idx_name(mn)
# get the name of the first index
idx_name(mn, 1)
# get the name of the second index
idx_name(mn, 2)
# get the name of the nesting variable for the second index
idx_name(mn, 2, 2)</pre>
```

methods.dfidx

Methods for dfidx

# Description

A dfidx is a data.frame with a "sticky" data.frame column which contains the indexes. Specific methods of functions that extract lines and/or columns of a data.frame are provided.

```
## S3 method for class 'dfidx'
x[i, j, drop]

## S3 method for class 'dfidx'
as.data.frame(x, row.names = NULL, optional = FALSE, ...)

## S3 method for class 'dfidx'
print(x, ..., n = 10L)

## S3 method for class 'dfidx'
head(x, n = 10L, ...)
```

8 methods.dfidx

```
## S3 method for class 'dfidx'
x[[y]]

## S3 method for class 'dfidx'
x$y

## S3 replacement method for class 'dfidx'
object$y <- value

## S3 replacement method for class 'dfidx'
object[[y]] <- value

## S3 method for class 'xseries'
print(x, ..., n = 10L)

## S3 method for class 'idx'
print(x, ..., n = 10L)

## S3 method for class 'dfidx'
mean(x, ...)</pre>
```

# Arguments

x, object	a dfidx object	
i	the row index	
j	the column index	
drop	if TRUE a vector is returned if the result is a one column $\ensuremath{data}.$ frame	
row.names, optional		
	arguments of the generic as.data.frame method, not used	
	further arguments	
n	the number of rows for the print method	
У	the name or the position of the series one wishes to extract	
value	the value for the replacement method	

#### Value

as.data.frame and mean return a data.frame, [[ and \$ a vector, [ either a dfidx or a vector, \$<- and [[<- modify the values of an existing column or create a new column of a dfidx object, print is called for its side effect

#### Author(s)

Yves Croissant

model.frame.dfidx 9

#### **Examples**

```
mn <- dfidx(munnell)</pre>
# extract a series (returns as a xseries object)
mn$gsp
# or
mn[["gsp"]]
# extract a subset of series (returns as a dfidx object)
mn[c("gsp", "unemp")]
# extract a subset of rows and columns
mn[mn$unemp > 10, c("utilities", "water")]
# dfidx, idx and xseries have print methods as (like tibbles), a n
# argument
print(mn, n = 3)
print(idx(mn), n = 3)
print(mn\$gsp, n = 3)
# a dfidx object can be coerced to a data.frame
head(as.data.frame(mn))
```

model.frame.dfidx

model.frame/matrix for dfidx objects

# **Description**

Specific model.frame/matrix are provided for dfidx objects. This leads to an unusual order of arguments compared to the usage. Actually, the first two arguments of the model.frame method are a dfidx and a formula and the only main argument of the model.matrix is a dfidx which should be the result of a call to the model.frame method, i.e. it should have a term attribute.

```
## S3 method for class 'dfidx'
model.frame(
  formula,
  data = NULL,
  . . . ,
  lhs = NULL,
  rhs = NULL,
  dot = "previous",
  alt.subset = NULL,
  reflevel = NULL,
  balanced = FALSE
)
## S3 method for class 'dfidx'
model.matrix(object, ..., lhs = NULL, rhs = 1, dot = "separate")
## S3 method for class 'dfidx_matrix'
print(x, ..., n = 10L)
```

10 munnell

# **Arguments**

```
formula
                  a dfidx
data
                  a formula
..., 1hs, rhs, dot
                  see the Formula method
alt.subset
                  a subset of levels for the second index
reflevel
                  a user-defined first level for the second index
balanced
                  a boolean indicating if the resulting data.frame has to be balanced or not
object
                  a dfidx object
                  a model matrix
Х
                  the number of lines to print
n
```

#### Value

a dfidx object for the model.frame method and a matrix for the model.matrix method.

# Author(s)

Yves Croissant

#### **Examples**

```
mn <- dfidx(munnell)
mf <- model.frame(mn, gsp ~ privatecap | publiccap + utilities | unemp + labor)
model.matrix(mf, rhs = 1)
model.matrix(mf, rhs = 2)
model.matrix(mf, rhs = 1:3)</pre>
```

munnell

Productivity in the United States

#### **Description**

```
a panel data of 48 American States for 17 years, from 1970 to 1986
```

```
munnell
munnell_wide
```

unfold\_idx 11

#### **Format**

a tibble containing:

state: the state year: the year

• region: one of the 9 regions of the United States

• president: the name of the president for the given year

• publiccap: public capital stock

· highway: highway and streets

· water: water and sewer facilities

· utilities: othe public building and structures

• privatecap: private capital stock

• gsp: gross state product

• labor: labor input measured by the employment in non-agricultural payrolls

• unemp: state unemployment rate

An object of class tbl\_df (inherits from tbl, data.frame) with 48 rows and 36 columns.

unfold\_idx

Fold and Unfold a dfidx object

#### **Description**

fold\_idx takes a dfidx, includes the indexes as stand alone columns, remove the idx column and return a data.frame, with an ids attribute that contains the informations about the indexes. fold\_idx performs the opposite operation

12 unfold\_idx

#### Usage

```
unfold_idx(x)
fold_idx(x, pkg = NULL)
```

# Arguments

x a dfidx objectpkg if not NULL, this argument is passed to dfidx

#### Value

a data.frame for the  $unfold\_dfidx$  function, a dfidx object for the  $fold\_dfidx$  function

# Author(s)

Yves Croissant

# **Examples**

```
mn <- dfidx(munnell, idx = c(region = "state", "year"), position = 3, name = "index")
mn2 <- unfold_idx(mn)
attr(mn, "ids")
mn3 <- fold_idx(mn2)
identical(mn, mn3)</pre>
```
