# Package 'ICEbox'

October 12, 2022

Type Package

**Version** 1.1.5 **Date** 2022-08-18

Title Individual Conditional Expectation Plot Toolbox

Author Alex Goldstein, Adam Kapelner, Justin Bleich	
Maintainer Adam Kapelner < kapelner@qc.cuny.edu>	
<b>Description</b> Implements Individual Conditional Expectation (ICE) plots, a tool for visualizing the model estimated by any supervised learning algorithm. ICE plots refine Friedman's partial dependence plot by graphing the functional relationship between the predicted response and a covariate of interest for individual observations. Specifically, ICE plots highlight the variation in the fitted values across the range of a covariate of interest, suggesting where and to what extent they may exist.

2 clusterICE

3	clusterICE	Clustering of ICE and d-ICE curves by kmeans.	
---	------------	---	--

# Description

Clustering if ICE and d-ICE curves by kmeans. All curves are centered to have mean 0 and then kmeans is applied to the curves with the specified number of clusters.

# Usage

# Arguments

ice_obj	Object of class ice or dice to cluster.
nClusters	Number of clusters to find.
plot	If TRUE, plots the clusters.
plot_margin	Extra margin to pass to ylim as a fraction of the range of cluster centers.
colorvec	Optional vector of colors to use for each cluster.
plot_pdp	If TRUE, the PDP (ice object) or d-PDP (dice object) is plotted with a dotted black line and highlighted in yellow.
x_quantile	If TRUE, the plot is drawn with the x-axis taken to be quantile(gridpts). If FALSE, the predictor's original scale is used.
avg_lwd	Average line width to use when plotting the cluster means. Line width is proportional to the cluster's size.
centered	If TRUE, all cluster means are shifted to be to be 0 at the minimum value of the predictor. If FALSE, the original cluster means are used.
plot_legend	If TRUE a legend mapping line colors to the proportion of the data in each cluster is added to the plot.
	Additional arguments for plotting.

## Value

The ouput of the kmeans call (a list of class kmeans).

ice, dice

dice 3

## **Examples**

```
## Not run:
require(ICEbox)
require(randomForest)
require(MASS) #has Boston Housing data, Pima
data(Boston) #Boston Housing data
X = Boston
y = X medv
X$medv = NULL
## build a RF:
bh_rf = randomForest(X, y)
## Create an 'ice' object for the predictor "age":
bh.ice = ice(object = bh_rf, X = X, y = y, predictor = "age",
            frac_to_build = .1)
## cluster the curves into 2 groups.
clusterICE(bh.ice, nClusters = 2, plot_legend = TRUE)
## cluster the curves into 3 groups, start all at 0.
clusterICE(bh.ice, nClusters = 3, plot_legend = TRUE, center = TRUE)
## End(Not run)
```

dice

Creates an object of class dice.

## **Description**

Estimates the partial derivative function for each curve in an ice object. See Goldstein et al (2013) for further details.

# Usage

```
dice(ice_obj, DerivEstimator)
```

## Arguments

ice\_obj

Object of class ice. This function generates partial derivative estimates for each row in ice\_obj\$ice\_curves.

DerivEstimator Optional function with a single argument y. Returns the estimated partial derivative of a function sampled at the points (ice\_obj\$gridpts,y). If omitted, the default (a) smooths (ice\_obj\$gridpts,y) using supsmu and then (b) uses the D1tr function ("discrete first derivative using simple difference ratios") found in the sfsmisc package to estimate the derivative.

4 dice

#### Value

A list of class dice with the following elements. Most are passed directly through from ice\_object and exist to enable various plotting facilities.

d\_ice\_curves Matrix of dimension nrow(Xice) by length(gridpts). Each row corresponds to an observation's d-ICE curve, estimated at the values of predictor in gridpts. The actual values of predictor observed in the data in the order of Xice. хj Vector of length nrow(Xice) containing the estimated partial derivatives at the actual\_deriv value of the predictor actually found in Xice. sd\_deriv Vector of length length(gridpts) with the cross-observation sd of partial derivative estimates. For instance sd\_deriv[1] equals sd(d\_ice\_curves[,1]). logodds Passed from ice\_object. If TRUE, d\_ice\_curves are estimated derivatives of the centered log-odds. gridpts Passed from ice\_object. predictor Passed from ice\_object. xlab Passed from ice\_object. nominal\_axis Passed from ice\_object. Passed from ice\_object. range\_y

Passed from ice\_object. dpdp The estimated partial derivative of the PDP.

## **Examples**

```
## Not run:
# same examples as for 'ice', but now create a derivative estimate as well.
require(ICEbox)
require(randomForest)
require(MASS) #has Boston Housing data, Pima
####### regression example
data(Boston) #Boston Housing data
X = Boston
y = X medv
```

ice 5

```
X$medv = NULL
## build a RF:
bhd_rf_mod = randomForest(X, y)
## Create an 'ice' object for the predictor "age":
bhd.ice = ice(object = bhd_rf_mod, X = X, y = y, predictor = "age", frac_to_build = .1)
# make a dice object:
bhd.dice = dice(bhd.ice)
#### classification example
data(Pima.te) #Pima Indians diabetes classification
y = Pima.te$type
X = Pima.te
X$type = NULL
## build a RF:
pima_rf = randomForest(x = X, y = y)
## Create an 'ice' object for the predictor "skin":
# For classification we plot the centered log-odds. If we pass a predict
# function that returns fitted probabilities, setting logodds = TRUE instructs
# the function to set each ice curve to the centered log-odds of the fitted
# probability.
pima.ice = ice(object = pima_rf, X = X, predictor = "skin", logodds = TRUE,
                    predictfcn = function(object, newdata){
                         predict(object, newdata, type = "prob")[, 2]
                    }
              )
# make a dice object:
pima.dice = dice(pima.ice)
## End(Not run)
```

ice

Creates an object of class ice.

## Description

Creates an ice object with individual conditional expectation curves for the passed model object, X matrix, predictor, and response. See Goldstein et al (2013) for further details.

### Usage

6 ice

#### **Arguments**

object The fitted model to estimate ICE curves for.

X The design matrix we wish to estimate ICE curves for. Rows are observations,

columns are predictors. Typically this is taken to be object's training data, but

this is not strictly necessary.

y Optional vector of the response values object was trained on. It is used to

compute y-axis ranges that are useful for plotting. If not passed, the range of

predicted values is used and a warning is printed.

predictor The column number or variable name in X of the predictor of interest, ( $x_S =$ 

X[,j]).

predictfcn Optional function that accepts two arguments, object and newdata, and returns

an N vector of object's predicted response for data newdata. If this argument is not passed, the procedure attempts to find a generic predict function corre-

sponding to class(object).

verbose If TRUE, prints messages about the procedure's progress.

frac\_to\_build Number between 0 and 1, with 1 as default. For large X matrices or fitted models

that are slow to make predictions, specifying frac\_to\_build less than 1 will choose a subset of the observations to build curves for. The subset is chosen such that the remaining observations' values of predictor are evenly spaced

throughout the quantiles of the full X[,predictor] vector.

indices\_to\_build

Vector of indices,  $\subset \{1, \dots, nrow(X)\}$  specifying which observations to build ICE curves for. As this is an alternative to setting frac\_to\_build, both cannot

be specified.

num\_grid\_pts Optional number of values in the range of predictor at which to estimate each

curve. If missing, the curves are estimated at each unique value of predictor

in the X observations we estimate ICE curves for.

logodds If TRUE, for classification creates PDPs by plotting the centered log-odds implied

by the fitted probabilities. We assume that the generic or passed predict function returns probabilities, and so the flag tells us to transform these to centered logits

after the predictions are generated. Note: probit cannot be TRUE.

probit If TRUE, for classification creates PDPs by plotting the probit implied by the

fitted probabilities. We assume that the generic or passed predict function returns probabilities, and so the flag tells us to transform these to probits after the

predictions are generated. Note: logodds cannot be TRUE.

.. Other arguments to be passed to object's generic predict function.

#### Value

A list of class ice with the following elements.

gridpts Sorted values of predictor at which each curve is estimated. Duplicates are

removed – by definition, elements of gridpts are unique.

ice\_curves Matrix of dimension nrow(X) by length(gridpts). Each row corresponds to

an observation's ICE curve, estimated at the values of predictor in gridpts.

ice 7

xj The actual values of predictor observed in the data in the order of Xice. actual\_predictions

Vector of length nrow(X) containing the model's predictions at the actual value of the predictors in the order of Xice.

of the predictors in the order of Arec.

xlab String with the predictor name corresponding to predictor. If predictor is a

column number, xlab is set to colnames(X)[, predictor].

nominal\_axis If TRUE, length(gridpts) is 5 or fewer; otherwise FALSE. When TRUE the plot

function treats the x-axis as if x is nominal.

range\_y If y was passed, the range of the response. Otherwise it defaults to be

max(ice\_curves) - min(ice\_curves) and a message is printed to the console.

sd\_y If y was passed, the standard deviation of the response. Otherwise it is defaults

to sd(actual\_predictions) and a message is printed to the console.

Xice A matrix containing the subset of X for which ICE curves are estimated. Obser-

vations are ordered to be increasing in predictor. This ordering is the same one as in ice\_curves, xj and actual\_predictions, meaning for all these objects

the i-th element refers to the same observation in X.

pdp A vector of size length(gridpts) which is a numerical approximation to the

partial dependence function (PDP) corresponding to the estimated ICE curves. See Goldstein et al (2013) for a discussion of how the PDP is a form of post-

processing. See Friedman (2001) for a description of PDPs.

predictor Same as the argument, see argument description.

logodds Same as the argument, see argument description.

indices\_to\_build

Same as the argument, see argument description.

frac\_to\_build Same as the argument, see argument description.

predictfcn Same as the argument, see argument description.

              )
## End(Not run)
```

plot.dice

Create a plot of a dice object.

## **Description**

Plotting of dice objects.

# Usage

9 plot.dice

Object of class dice to plot.

#### **Arguments**

plot\_margin Extra margin to pass to ylim as a fraction of the range of x\$d\_ice\_curves. frac\_to\_plot If frac\_to\_plot is less than 1, randomly plot frac\_to\_plot fraction of the curves in x\$d\_ice\_curves. plot\_sd If TRUE, plot the cross-observation sd of partial derivatives below the derivative plots. plot\_orig\_pts\_deriv If TRUE, marks each curve at the location of the derivative estimate at the location of predictor actually occurring in the data. If FALSE no mark is drawn. pts\_preds\_size Size of points to make if plot\_orig\_pts\_deriv is TRUE. colorvec Optional vector of colors to use for each curve. color\_by Optional variable name (or column number) in Xice to color curves by. If the color\_by variable has 10 or fewer unique values, a discrete set of colors is used for each value and a legend is printed and returned. If there are more values, curves are colored from light to dark corresponding to low to high values of the variable specified by color\_by. x\_quantile If TRUE, the plot is drawn with the x-axis taken to be quantile(gridpts). If

FALSE, the predictor's original scale is used.

plot\_dpdp If TRUE, the estimated derivative of the PDP is plotted and highlighted in yellow. rug\_quantile If not null, tick marks are drawn on the x-axis corresponding to the vector of

quantiles specified by this parameter. Forced to NULL when x\_quantile is set

to TRUE.

Additional plotting arguments.

#### Value

A list with the following elements.

plot\_points\_indices

Row numbers of Xice of those observations presented in the plot.

legend\_text If the color\_by argument was used, a legend describing the map between the

color\_by predictor and curve colors.

plot(bhd.dice)

## End(Not run)
```

plot.ice

Plotting of ice objects.

## **Description**

Plotting of ice objects.

## Usage

```
## S3 method for class 'ice'
plot(x, plot_margin = 0.05, frac_to_plot = 1,
    plot_points_indices = NULL, plot_orig_pts_preds = TRUE,
        pts_preds_size = 1.5, colorvec, color_by = NULL,
        x_quantile = TRUE, plot_pdp = TRUE,
        centered = FALSE, prop_range_y = TRUE,
        rug_quantile = seq(from = 0, to = 1, by = 0.1),
        centered_percentile = 0,
        point_labels = NULL, point_labels_size = NULL,
        prop_type,...)
```

## **Arguments**

x Object of class ice to plot.

plot\_margin Extra margin to pass to ylim as a fraction of the range of x\$ice\_curves.

frac\_to\_plot If frac\_to\_plot is less than 1, randomly plot frac\_to\_plot fraction of the curves in x\$ice\_curves.

plot\_points\_indices

If not NULL, this plots only the indices of interest. If not NULL, frac\_to\_plot must be 1 otherwise an error is thrown. Default is NULL.

plot\_orig\_pts\_preds

If TRUE, marks each curve at the location of the observation's actual fitted value. If FALSE, no mark is drawn.

plot.ice 11

pts\_preds\_size Size of points to make if plot\_origin\_pts\_preds is TRUE.

colorvec Optional vector of colors to use for each curve.

color\_by Optional variable name in Xice, column number in Xice, or data vector of the

correct length to color curves by. If the color\_by variable has 10 or fewer unique values, a discrete set of colors is used for each value and a legend is printed and returned. If there are more values, curves are colored from light to dark corresponding to low to high values of the variable specified by color\_by.

x\_quantile If TRUE, the plot is drawn with the x-axis taken to be quantile(gridpts). If

FALSE, the predictor's original scale is used.

plot\_pdp If TRUE, the PDP is plotted and highlighted in yellow.

centered If TRUE, all curves are re-centered to be 0 at the quantile given by

centered\_percentile. See Goldstein et al (2013) for details and examples. If

FALSE, the original ice\_curves are plotted.

prop\_range\_y When TRUE and centered=TRUE as well, the range of the right vertical axis

displays the centered values as a fraction of the sd of the fitted values on actual observations if prop\_type is missing or set to "sd". If prop\_type is set to "range", the right axis displays the centered values as a fraction of the range of

the fitted values over the actual observations.

centered\_percentile

The percentile of predictor for which all ice\_curves are "pinched together"

and set to be 0. Default is .01.

point\_labels If not NULL, labels to plot next to each point. Default is NULL.

point\_labels\_size

If not NULL, size of labels to plot next to each point. Default is NULL which

means it's the size of pts\_preds\_size.

rug\_quantile If not NULL, tick marks are drawn on the x-axis corresponding to the vector of

quantiles specified by this parameter. Forced to NULL when x\_quantile is set

to TRUE.

prop\_type Scaling factor for the right vertical axis in centered plots if prop\_range\_y is

TRUE. Can be one of "sd" (default) or "range". Ignored if centered and

prop\_range\_y are not both TRUE.

. . . Other arguments to be passed to the plot function.

#### Value

A list with the following elements.

plot\_points\_indices

Row numbers of Xice of those observations presented in the plot.

legend\_text If the color\_by argument was used, a legend describing the map between the

color\_by predictor and curve colors.

14 White Wine

summary.ice

Summary function for ice objects.

## **Description**

Alias of print method.

# Usage

```
## S3 method for class 'ice'
summary(object, ...)
```

# Arguments

object Object of class ice.
... Ignored for now.

WhiteWine

Data concerning white wine.

# Description

The WhiteWine data frame has 4898 rows and 12 columns and concerns white wines from a region in Portugal. The response variable, quality, is a wine quality metric, taken to be the median preference score of three blind tasters on a scale of 1-10. The 11 covariates are physicochemical metrics of wine quality such as citric acid content, sulphates, etc.

## Usage

```
data(WhiteWine)
```

## **Format**

A data frame of 4898 cases on 12 variables.
