# Package 'mfx'

October 13, 2022

Title Marginal Effects, Odds Ratios and Incidence Rate Ratios for GLMs

Type Package

version 1.2-2
<b>Date</b> 2019-02-06
Description Estimates probit, logit, Poisson, negative binomial, and beta regression models, returning their marginal effects, odds ratios, or incidence rate ratios as an output.  Greene (2008, pp. 780-7) provides a textbook introduction to this topic.
License GPL-2   GPL-3
Depends stats, sandwich, lmtest, MASS, betareg
NeedsCompilation no

2 betamfx

betamfx Marginal effects for a beta regression.
Detamtx Marginal effects for a beta regression.

# Description

This function estimates a beta regression model and calculates the corresponding marginal effects.

# Usage

# Arguments

formula	an object of class "formula" (or one that can be coerced to that class).
data	the data frame containing these data. This argument must be used.
atmean	default marginal effects represent the partial effects for the average observation. If atmean = FALSE the function calculates average partial effects.
robust	if TRUE the function reports White/robust standard errors.
clustervar1	a character value naming the first cluster on which to adjust the standard errors.
clustervar2	a character value naming the second cluster on which to adjust the standard errors for two-way clustering.
control	a list of control arguments specified via betareg.control.
link.phi	as in the betareg function.
type	as in the betareg function.

# **Details**

The underlying link function in the mean model (mu) is "logit". If both robust=TRUE and !is.null(clustervar1) the function overrides the robust command and computes clustered standard errors.

#### Value

mfxest	a coefficient matrix with columns containing the estimates, associated standard errors, test statistics and p-values.
fit	the fitted betareg object.
dcvar	a character vector containing the variable names where the marginal effect refers to the impact of a discrete change on the outcome. For example, a factor variable.
call	the matched call.

betaor 3

#### See Also

```
betaor, betareg
```

# **Examples**

```
# simulate some data
set.seed(12345)
n = 1000
x = rnorm(n)

# beta outcome
y = rbeta(n, shape1 = plogis(1 + 0.5 * x), shape2 = (abs(0.2*x)))
# use Smithson and Verkuilen correction
y = (y*(n-1)+0.5)/n

data = data.frame(y,x)
betamfx(y~x|x, data=data)
```

betaor

Odds ratios for a beta regression.

# Description

This function estimates a beta regression model and calculates the corresponding odds ratios.

# Usage

### **Arguments**

type

formula	an object of class "formula" (or one that can be coerced to that class).
data	the data frame containing these data. This argument must be used.
robust	if TRUE the function reports White/robust standard errors.
clustervar1	a character value naming the first cluster on which to adjust the standard errors.
clustervar2	a character value naming the second cluster on which to adjust the standard errors for two-way clustering.
control	a list of control arguments specified via betareg.control.
link.phi	as in the betareg function.

as in the betareg function.

4 logitmfx

#### **Details**

The underlying link function in the mean model (mu) is "logit". If both robust=TRUE and !is.null(clustervar1) the function overrides the robust command and computes clustered standard errors.

#### Value

oddsratio a coefficient matrix with columns containing the estimates, associated standard errors, test statistics and p-values.

fit the fitted betareg object.

call the matched call.

# See Also

```
betamfx, betareg
```

#### **Examples**

```
# simulate some data
set.seed(12345)
n = 1000
x = rnorm(n)

# beta outcome
y = rbeta(n, shape1 = plogis(1 + 0.5 * x), shape2 = (abs(0.2*x)))
# use Smithson and Verkuilen correction
y = (y*(n-1)+0.5)/n

data = data.frame(y,x)
betaor(y~x|x, data=data)
```

logitmfx

Marginal effects for a logit regression.

# **Description**

This function estimates a binary logistic regression model and calculates the corresponding marginal effects.

logitmfx 5

# Usage

# Arguments

formula	an object of class "formula" (or one that can be coerced to that class).
data	the data frame containing these data. This argument must be used.
atmean	default marginal effects represent the partial effects for the average observation. If atmean = FALSE the function calculates average partial effects.
robust	if TRUE the function reports White/robust standard errors.
clustervar1	a character value naming the first cluster on which to adjust the standard errors.
clustervar2	a character value naming the second cluster on which to adjust the standard errors for two-way clustering.
start	starting values for the parameters in the glm model.
control	see glm.control.

# **Details**

If both robust=TRUE and !is.null(clustervar1) the function overrides the robust command and computes clustered standard errors.

# Value

mfxest	a coefficient matrix with columns containing the estimates, associated standard errors, test statistics and p-values.
fit	the fitted glm object.
dcvar	a character vector containing the variable names where the marginal effect refers to the impact of a discrete change on the outcome. For example, a factor variable.
call	the matched call.

logitor, glm
```

6 logitor

#### **Examples**

```
# simulate some data
set.seed(12345)
n = 1000
x = rnorm(n)

# binary outcome
y = ifelse(pnorm(1 + 0.5*x + rnorm(n))>0.5, 1, 0)

data = data.frame(y,x)
logitmfx(formula=y~x, data=data)
```

logitor

Odds ratios for a logit regression.

#### **Description**

This function estimates a binary logistic regression model and calculates the corresponding odds ratios.

# Usage

#### **Arguments**

formula an object of class "formula" (or one that can be coerced to that class).

the data frame containing these data. This argument must be used.

robust if TRUE the function reports White/robust standard errors.

clustervar1 a character value naming the first cluster on which to adjust the standard errors.

clustervar2 a character value naming the second cluster on which to adjust the standard errors for two-way clustering.

start starting values for the parameters in the glm model.

see glm.control.

# Details

If both robust=TRUE and !is.null(clustervar1) the function overrides the robust command and computes clustered standard errors.

# Value

oddsratio	a coefficient matrix with columns containing the estimates, associated standard errors, test statistics and p-values.
fit	the fitted glm object.
call	the matched call.

negbinirr 7

#### See Also

```
logitmfx, glm
```

#### **Examples**

```
# simulate some data
set.seed(12345)
n = 1000
x = rnorm(n)

# binary outcome
y = ifelse(pnorm(1 + 0.5*x + rnorm(n))>0.5, 1, 0)
data = data.frame(y,x)
logitor(formula=y~x, data=data)
```

negbinirr

Incidence rate ratios for a negative binomial regression.

#### **Description**

This function estimates a negative binomial regression model and calculates the corresponding incidence rate ratios.

#### Usage

# **Arguments**

formula an object of class "formula" (or one that can be coerced to that class).

the data frame containing these data. This argument must be used.

robust if TRUE the function reports White/robust standard errors.

clustervar1 a character value naming the first cluster on which to adjust the standard errors.

clustervar2 a character value naming the second cluster on which to adjust the standard errors for two-way clustering.

start starting values for the parameters in the glm.nb model.

control see glm. control.

### Details

If both robust=TRUE and !is.null(clustervar1) the function overrides the robust command and computes clustered standard errors.

8 negbinmfx

#### Value

irr a coefficient matrix with columns containing the estimates, associated standard errors, test statistics and p-values.
 fit the fitted glm.nb object.
 call the matched call.

#### See Also

```
negbinmfx, glm.nb
```

# **Examples**

```
# simulate some data
set.seed(12345)
n = 1000
x = rnorm(n)
y = rnegbin(n, mu = exp(1 + 0.5 * x), theta = 0.5)
data = data.frame(y,x)
negbinirr(formula=y~x,data=data)
```

negbinmfx

Marginal effects for a negative binomial regression.

# **Description**

This function estimates a negative binomial regression model and calculates the corresponding marginal effects.

#### Usage

#### **Arguments**

an object of class "formula" (or one that can be coerced to that class). formula data the data frame containing these data. This argument must be used. default marginal effects represent the partial effects for the average observation. atmean If atmean = FALSE the function calculates average partial effects. robust if TRUE the function reports White/robust standard errors. clustervar1 a character value naming the first cluster on which to adjust the standard errors. a character value naming the second cluster on which to adjust the standard clustervar2 errors for two-way clustering. start starting values for the parameters in the glm. nb model. see glm.control. control

poissonirr 9

# **Details**

If both robust=TRUE and !is.null(clustervar1) the function overrides the robust command and computes clustered standard errors.

#### Value

mfxes <sup>-</sup>	a coefficient matrix with columns containing the estimates, associated standard errors, test statistics and p-values.
fit	the fitted glm. nb object.
dcvar	a character vector containing the variable names where the marginal effect refers to the impact of a discrete change on the outcome. For example, a factor vari- able.
call	the matched call.

#### See Also

```
negbinirr, glm.nb
```

# **Examples**

```
# simulate some data
set.seed(12345)
n = 1000
x = rnorm(n)
y = rnegbin(n, mu = exp(1 + 0.5 * x), theta = 0.5)
data = data.frame(y,x)
negbinmfx(formula=y~x,data=data)
```

poissonirr

Incidence rate ratios for a Poisson regression.

# Description

This function estimates a negative binomial regression model and calculates the corresponding incidence rate ratios.

# Usage

10 poissonirr

# Arguments

formula an object of class "formula" (or one that can be coerced to that class).

data the data frame containing these data. This argument must be used.

robust if TRUE the function reports White/robust standard errors.

clustervar1 a character value naming the first cluster on which to adjust the standard errors.

clustervar2 a character value naming the second cluster on which to adjust the standard

errors for two-way clustering.

start starting values for the parameters in the glm model.

control see glm. control.

# **Details**

If both robust=TRUE and !is.null(clustervar1) the function overrides the robust command and computes clustered standard errors.

#### Value

irr a coefficient matrix with columns containing the estimates, associated standard

errors, test statistics and p-values.

fit the fitted glm object.

call the matched call.

#### See Also

```
poissonmfx, glm
```

# **Examples**

```
# simulate some data
set.seed(12345)
n = 1000
x = rnorm(n)
y = rnegbin(n, mu = exp(1 + 0.5 * x), theta = 0.5)
data = data.frame(y,x)
poissonirr(formula=y~x,data=data)
```

poissonmfx 11

poissonmfx	Marginal effects for a Poisson regression.	

# Description

This function estimates a Poisson regression model and calculates the corresponding marginal effects.

# Usage

# Arguments

formula	an object of class "formula" (or one that can be coerced to that class).
data	the data frame containing these data. This argument must be used.
atmean	default marginal effects represent the partial effects for the average observation. If atmean = FALSE the function calculates average partial effects.
robust	if TRUE the function reports White/robust standard errors.
clustervar1	a character value naming the first cluster on which to adjust the standard errors.
clustervar2	a character value naming the second cluster on which to adjust the standard errors for two-way clustering.
start	starting values for the parameters in the glm model.
control	see glm.control.

#### **Details**

If both robust=TRUE and !is.null(clustervar1) the function overrides the robust command and computes clustered standard errors.

# Value

mfxest	a coefficient matrix with columns containing the estimates, associated standard errors, test statistics and p-values.
fit	the fitted glm object.
dcvar	a character vector containing the variable names where the marginal effect refers to the impact of a discrete change on the outcome. For example, a factor variable.
call	the matched call.

# See Also

```
poissonirr, glm
```

12 probitmfx

#### **Examples**

```
# simulate some data
set.seed(12345)
n = 1000
x = rnorm(n)
y = rnegbin(n, mu = exp(1 + 0.5 * x), theta = 0.5)
data = data.frame(y,x)
poissonmfx(formula=y~x,data=data)
```

probitmfx

Marginal effects for a probit regression.

# **Description**

This function estimates a probit regression model and calculates the corresponding marginal effects.

# Usage

1 22 /

#### **Arguments**

formula	an object of class "formula" (or one that can be coerced to that class).
data	the data frame containing these data. This argument must be used.
atmean	default marginal effects represent the partial effects for the average observation. If atmean = FALSE the function calculates average partial effects.
robust	if TRUE the function reports White/robust standard errors.
clustervar1	a character value naming the first cluster on which to adjust the standard errors.
clustervar2	a character value naming the second cluster on which to adjust the standard errors for two-way clustering.
start	starting values for the parameters in the glm model.
control	see glm.control.

#### **Details**

If both robust=TRUE and !is.null(clustervar1) the function overrides the robust command and computes clustered standard errors.

probitmfx 13

# Value

mfxest a coefficient matrix with columns containing the estimates, associated standard

errors, test statistics and p-values.

fit the fitted glm object.

dcvar a character vector containing the variable names where the marginal effect refers

to the impact of a discrete change on the outcome. For example, a factor vari-

able.

call the matched call.
