rprojroot: Finding Files in Project Subdirectories

# Description

Robust, reliable and flexible paths to files below a project root. The 'root' of a project is defined as a directory that matches a certain criterion, e.g., it contains a certain regular file.

#### **Details**

See the "Value" section in root\_criterion() for documentation of root criterion objects, and criteria for useful predefined root criteria.

#### Author(s)

Maintainer: Kirill Müller <kirill@cynkra.com> (ORCID)

#### See Also

- Report bugs at https://github.com/r-lib/rprojroot/issues

#### **Examples**

```
criteria
## Not run:
is_r_package$find_file("NAMESPACE")
root_fun <- is_r_package$make_fix_file()
root_fun("NAMESPACE")
## End(Not run)</pre>
```

criteria

Prespecified criteria

# **Description**

This is a collection of commonly used root criteria.

criteria 3

#### Usage

```
criteria
is_rstudio_project
is_r_package
is_remake_project
is_drake_project
is_pkgdown_project
is_renv_project
is_projectile_project
is_quarto_project
is_git_root
is_svn_root
is_vcs_root
is_testthat
from_wd
is_rstudio_project looks for a file with extension . Rproj.
is_r_package looks for a DESCRIPTION file.
is_remake_project looks for a remake.yml file.
```

#### **Details**

```
is_rstudio_project looks for a file with extension .Rproj.
is_r_package looks for a DESCRIPTION file.
is_remake_project looks for a remake.yml file.
is_drake_project looks for a .drake directory.
is_pkgdown_project looks for a _pkgdown.yml, _pkgdown.yaml, pkgdown/_pkgdown.yml and/or inst/_pkgdown.yml file.
is_renv_project looks for an renv.lock file.
is_projectile_project looks for a .projectile file.
is_quarto_project looks for a _quarto.yml file.
is_git_root looks for a .git directory.
is_svn_root looks for a .svn directory.
is_vcs_root looks for the root of a version control system, currently only Git and SVN are supported.
```

4 find\_root

is\_testthat looks for the testthat directory, works when developing, testing, and checking a package.

from\_wd uses the current working directory.

find\_root

Find the root of a directory hierarchy

# **Description**

A *root* is defined as a directory that contains a regular file whose name matches a given pattern and which optionally contains a given text. The search for a root starts at a given directory (the working directory by default), and proceeds up the directory hierarchy.

get\_root\_desc() returns the description of the criterion for a root path. This is especially useful
for composite root criteria created with |.root\_criterion().

# Usage

```
find_root(criterion, path = ".")
get_root_desc(criterion, path)
```

#### **Arguments**

criterion [root\_criterion]

A criterion, one of the predefined criteria or created by root\_criterion().

Will be coerced using as\_root\_criterion().

path [character(1)]

The start directory.

#### **Details**

Starting from the working directory, the find\_root() function searches for the root. If a root is found, the ... arguments are used to construct a path; thus, if no extra arguments are given, the root is returned. If no root is found, an error is thrown.

#### Value

The normalized path of the root as specified by the search criterion. Throws an error if no root is found

#### See Also

```
utils::glob2rx() file.path()
```

find\_root\_file 5

## **Examples**

```
## Not run:
find_root(glob2rx("DESCRIPTION"), "^Package: ")
## End(Not run)
```

find\_root\_file

File paths relative to the root of a directory hierarchy

# **Description**

find\_root\_file() is a wrapper around find\_root() that appends an arbitrary number of path
components to the root using base::file.path().

# Usage

```
find_root_file(..., criterion, path = ".")
find_rstudio_root_file(..., path = ".")
find_package_root_file(..., path = ".")
find_remake_root_file(..., path = ".")
find_testthat_root_file(..., path = ".")
```

# **Arguments**

... [character]

Further path components passed to file.path(). All arguments must be the

same length or length one.

criterion [root\_criterion]

A criterion, one of the predefined criteria or created by root\_criterion().

Will be coerced using as\_root\_criterion().

path [character(1)]

The start directory.

# **Details**

This function operates on the notion of relative paths. The ... argument is expected to contain a path relative to the root. If the first path component passed to ... is already an absolute path, the criterion and path arguments are ignored, and ... is forwarded to file.path().

#### Value

The normalized path of the root as specified by the search criteria, with the additional path components appended. Throws an error if no root is found.

6 root\_criterion

#### See Also

```
find_root() utils::glob2rx() base::file.path()
```

# **Examples**

```
## Not run:
find_package_root_file("tests", "testthat.R")
has_file("DESCRIPTION", "^Package: ")$find_file
has_file("DESCRIPTION", "^Package: ")$make_fix_file(".")
## End(Not run)
```

root\_criterion

Is a directory the project root?

# **Description**

Objects of the root\_criterion class decide if a given directory is a project root.

#### Usage

```
root_criterion(testfun, desc, subdir = NULL)
is_root_criterion(x)
as_root_criterion(x)
## S3 method for class 'character'
as_root_criterion(x)
## S3 method for class 'root_criterion'
as_root_criterion(x)
## S3 method for class 'root_criterion'
x | y
has_file(filepath, contents = NULL, n = -1L, fixed = FALSE)
has_dir(filepath)
has_file_pattern(pattern, contents = NULL, n = -1L, fixed = FALSE)
has_basename(basename, subdir = NULL)
```

root\_criterion 7

## Arguments

testfun [function|list(function)]

A function with one parameter that returns TRUE if the directory specified by this parameter is the project root, and FALSE otherwise. Can also be a list of such

functions.

desc [character]

A textual description of the test criterion, of the same length as testfun.

subdir [character]

Subdirectories to start the search in, if found

x [object]
An object.
y [object]

An object.

filepath [character(1)]

File path (can contain directories).

contents, fixed

[character(1)]

If contents is NULL (the default), file contents are not checked. Otherwise, contents is a regular expression (if fixed is FALSE) or a search string (if fixed

is TRUE), and file contents are checked matching lines.

n [integerish(1)]

Maximum number of lines to read to check file contents.

pattern [character(1)]

Regular expression to match the file name against.

basename [character(1)]

The required name of the root directory.

# Details

Construct criteria using root\_criterion in a very general fashion by specifying a function with a path argument, and a description.

The as\_root\_criterion() function accepts objects of class root\_criterion, and character values; the latter will be converted to criteria using has\_file.

Root criteria can be combined with the | operator. The result is a composite root criterion that requires either of the original criteria to match.

The has\_file() function constructs a criterion that checks for the existence of a specific file (which itself can be in a subdirectory of the root) with specific contents.

The has\_dir() function constructs a criterion that checks for the existence of a specific directory.

The has\_file\_pattern() function constructs a criterion that checks for the existence of a file that matches a pattern, with specific contents.

The has\_basename() function constructs a criterion that checks if the base::basename() of the root directory has a specific name, with support for case-insensitive file systems.

8 root\_criterion

# Value

An S3 object of class root\_criterion wit the following members:

```
testfun The testfun argument
desc The desc argument
subdir The subdir argument
```

find\_file A function with ... and path arguments that returns a path relative to the root, as specified by this criterion. The optional path argument specifies the starting directory, which defaults to ".". The function forwards to find\_root\_file(), which passes ... directly to file.path() if the first argument is an absolute path.

make\_fix\_file A function with a path argument that returns a function that finds paths relative to the root. For a criterion cr, the result of cr\$make\_fix\_file(".")(...) is identical to cr\$find\_file(...). The function created by make\_fix\_file() can be saved to a variable to be more independent of the current working directory.

# Examples

```
root_criterion(function(path) file.exists(file.path(path, "somefile")), "has somefile")
has_file("DESCRIPTION")
is_r_package
## Not run:
is_r_package$find_file
is_r_package$make_fix_file(".")
## End(Not run)
```
