# Package 'phonfieldwork'

July 29, 2024

```
Type Package
Title Linguistic Phonetic Fieldwork Tools
Version 0.0.17
Depends R (>= 3.5.0)
Imports tuneR, phonTools, grDevices, utils, graphics, rmarkdown, xml2,
      readr, tools, mime
Description There are a lot of different typical tasks that have to be solved during phonetic re-
      search and experiments. This includes creating a presentation that will contain all stimuli, renam-
      ing and concatenating multiple sound files recorded during a session, automatic annota-
      tion in 'Praat' TextGrids (this is one of the sound annotation standards provided by 'Praat' soft-
      ware, see Boersma & Weenink 2020 <a href="https://www.fon.hum.uva.nl/praat/">https://www.fon.hum.uva.nl/praat/</a>), creat-
      ing an html table with annotations and spectrograms, and converting multiple for-
      mats ('Praat' TextGrid, 'ELAN', 'EXMARaLDA', 'Audacity', subtitles '.srt', and 'FLEx' flex-
      text). All of these tasks can be solved by a mixture of different tools (any programming lan-
      guage has programs for automatic renaming, and Praat contains scripts for concatenating and re-
      naming files, etc.). 'phonfieldwork' provides a functionality that will make it eas-
      ier to solve those tasks independently of any additional tools. You can also compare the function-
      ality with other pack-
      ages: 'rPraat' <https://CRAN.R-project.org/package=rPraat>, 'textgRid' <https:
      //CRAN.R-project.org/package=textgRid>.

add\_leading\_symbols 3

add\_leading\_symbols

Create indices padded with zeros

# Description

Create indices padded with zeros. This is important for creating appropriate for sorting names.

# Usage

```
add_leading_symbols(file_names)
```

## **Arguments**

file\_names

vector of any values.

#### Value

A string with numbers padded with leadinng zero.

#### Author(s)

George Moroz <agricolamz@gmail.com>

annotate\_textgrid

Annotate textgrid

# Description

Annotates textgrids. It is possible to define step in the argument "each", so each second element of the tier will be annotated.

## Usage

```
annotate_textgrid(
  annotation,
  textgrid,
  tier = 1,
  each = 1,
  backup = TRUE,
  write = TRUE
)
```

4 audacity\_to\_df

## **Arguments**

annotation	vector of stimuli
textgrid	character with a filename or path to the TextGrid
tier	value that could be either ordinal number of the tier either name of the tier
each	non-negative integer. Each element of x is repeated each times
backup	logical. If TRUE (by default) it creates a backup tier.
write	logical. If TRUE (by dafault) it overwrites an existing tier.

#### Value

a string that contain TextGrid. If argument write is TRUE, then no output.

#### Author(s)

George Moroz <agricolamz@gmail.com>

## **Examples**

```
annotate_textgrid(
  annotation = c("", "t", "e", "s", "t"),
  textgrid = system.file("extdata",
    "test.TextGrid",
    package = "phonfieldwork"
  ),
  tier = 2, write = FALSE
)
```

audacity\_to\_df

Audacity's labels to dataframe

## Description

Audacity make it possible to annotate sound files with labels that can be exported as a .tsv file with .txt extension. This function convert result to dataframe.

## Usage

```
audacity_to_df(file_name)
```

#### **Arguments**

file\_name file\_name string with a filename or path to the .txt file produced by Audacity

## Value

a dataframe with columns: content, time\_start, time\_end, source.

concatenate\_soundfiles 5

#### Author(s)

George Moroz <agricolamz@gmail.com>

#### **Examples**

```
audacity_to_df(system.file("extdata",
    "test_audacity.txt",
    package = "phonfieldwork"
))
```

concatenate\_soundfiles

Concatenate sounds

# Description

Creates a merged sound file from old sound files in a folder. If the annotation argument is not equal to NULL, it creates an annotation file (Praat .TextGrid, ELAN .eaf or EXMARaLDA .exb) with original sound names annotation.

#### Usage

```
concatenate_soundfiles(
  path,
  result_file_name = "concatenated",
  annotation = "textgrid",
  separate_duration = 0
)
```

#### Arguments

path path to the directory with soundfiles.

result\_file\_name

name of the result and annotation files.

annotation

character. There are several variants: "textgrid" for Praat TextGrid, "eaf" for ELAN's .eaf file, or "exb" for EXMARaLDA's .exb file. It is also possible to use NULL in order to prevent the creation of the annotation file.

separate\_duration

double. It is possible to add some silence between concatenated sounds. This variable denotes duration of this soundless separator in seconds.

#### Value

no output

#### Author(s)

#### **Examples**

```
# create two files in a temprary folder "test_folder"
s1 <- system.file("extdata", "test.wav", package = "phonfieldwork")
s2 <- system.file("extdata", "post.wav", package = "phonfieldwork")
tdir <- tempdir()
file.copy(c(s1, s2), tdir)

# here are two .wav files in a folder
list.files(tdir)
# [1] "post.wav" "test.wav" ...

# Concatenate all files from the folder into concatenated.wav and create
# corresponding TextGrid
concatenate_soundfiles(path = tdir, result_file_name = "concatenated")

list.files(tdir)
# [1] "concatenated.TextGrid" "concatenated.wav" "post.wav" "test.wav" ...</pre>
```

concatenate\_textgrids Concatenate TextGrids

#### **Description**

Creates a merged TextGrids from TextGrids files in a folder.

#### Usage

```
concatenate_textgrids(path, result_file_name = "concatenated")
```

## **Arguments**

#### Value

no output

#### Author(s)

7 create\_empty\_textgrid

#### **Examples**

```
# create two files in a temprary folder "test_folder"
t1 <- system.file("extdata", "test.TextGrid", package = "phonfieldwork")</pre>
t2 <- system.file("extdata", "post.TextGrid", package = "phonfieldwork")
tdir <- tempdir()</pre>
file.copy(c(t1, t2), tdir)
# here are two .wav files in a folder
list.files(tdir)
# [1] "post.TextGrid" "test.TextGrid" ...
# Concatenate all TextGrids from the folder into concatenated.TextGrid
concatenate_textgrids(path = tdir, result_file_name = "concatenated")
list.files(tdir)
# [1] "concatenated.TextGrid" "post.TextGrid" "test.TextGrid" ...
```

create\_empty\_textgrid Create an empty TextGrid

#### **Description**

Creates an empty Praat TextGrid in the same folder as a reference sound file. It is possible to manage with predefined number of tiers, their names and their types.

## Usage

```
create_empty_textgrid(
  duration,
  tier_name = NULL,
 point_tier = NULL,
 path,
  result_file_name = "new_textgrid"
)
```

#### **Arguments**

duration integer. Duration of the textgrid. If you do not know the duration of your audio file use the get\_sound\_duration() function. tier\_name a vector that contain tier names.

point\_tier a vector that defines which tiers should be made point tiers. This argument excepts numeric values (e. g. c(2, 4) means second and forth tiers) or character

(e. g. c("a", "b") means tiers with names "a" and "b")

path to the directory with soundfiles. path

result\_file\_name

name of the result and annotation files.

## Value

The function returns no output, just creates a Praat TextGrid in the same folder as a reference sound file.

#### Author(s)

George Moroz <agricolamz@gmail.com>

# **Examples**

```
tmp <- tempfile(fileext = ".TextGrid")
create_empty_textgrid(1, path = dirname(tmp), result_file_name = basename(tmp))</pre>
```

create\_glossed\_document

Create a glossed document

## **Description**

Creates a file with glossed example (export from .flextext or other formats)

## Usage

```
create_glossed_document(
  flextext = NULL,
  rows = c("gls"),
  output_dir,
  output_file = "glossed_document",
  output_format = "html",
  example_pkg = NULL
)
```

#### **Arguments**

flextext	path to a .flextext file or a dataframe with the following columns: p_id, s_id, w_id, txt, cf, hn, gls, msa, morph, word, phrase, paragraph, free_trans, text, text_title
rows	vector of row names from the flextext that should appear in the final document. Possible values are: "cf", "hn", "gls", "msa". "gls" is default.
output_dir	the output directory for the rendered file
output_file	the name of the result .html file (by default glossed_document).
output_format	The option can be "html" or "docx"
example_pkg	vector with name of the LaTeX package for glossing (possible values: "gb4e", "langsci", "expex", "philex")

create\_image\_look\_up 9

## Value

If render is FALSE, the function returns a path to the temporary file with .csv file. If render is TRUE, there is no output in a function.

## Author(s)

George Moroz <agricolamz@gmail.com>

## **Description**

Create image look\_up objects for html viewer

## Usage

```
create_image_look_up(img_src, img_caption = NULL, text = "👁")
```

## **Arguments**

img\_src string or vector of strings with a image(s) path(s).

img\_caption string or vector of strings that will be displayed when image is clicked.

text string o vector of strings that will be displayed as view link. By default it is eye

emoji (👁).

#### Value

a string or vector of strings

#### Author(s)

10 create\_presentation

## **Description**

Creates an html or powerpoint presentation in a working directory from list of words and translations. Here is an example of such presentation.

#### Usage

```
create_presentation(
   stimuli,
   translations = "",
   external = NULL,
   font_size = 50,
   output_dir,
   output_format = "html",
   output_file = "stimuli_presentation",
   render = TRUE
)
```

#### **Arguments**

stimuli the vector of stimuli (obligatory). Can be a path to an image.

translations the vector of translations (optional)

external the vector with the indices of external images

font\_size font size in px (50, by default)

output\_dir the output directory for the rendered file

output\_format the string that difine the R Markdown output format: "html" (by default) or

"pptx"

output\_file the name of the result presentation file (by default stimuli\_presentation)

render the logical argument, if TRUE render the created R Markdown presentation to the

output\_dir folder, otherwise returns the path to the temporary file with a Rmd

file.

#### Value

If render is FALSE, the function returns a path to the temporary file. If render is TRUE, there is no output in a function.

#### Author(s)

create\_sound\_play 11

## **Examples**

```
create_presentation(
  stimuli = c("rzeka", "drzewo"),
  translations = c("river", "tree"),
  render = FALSE
)
# with image
create_presentation(
  stimuli = c(
   "rzeka", "drzewo",
   system.file("extdata", "r-logo.png",
     package = "phonfieldwork"
   )
  ),
  translations = c("river", "tree", ""),
  external = 3,
  render = FALSE
)
```

create\_sound\_play

Create audio play objects for html viewer

## **Description**

Create audio play objects for html viewer

## Usage

```
create_sound_play(snd_src, text = "👂")
```

## **Arguments**

snd\_src string or vector of strings with a image(s) path(s).

text string o vector of strings that will be displayed as view link. By default it is ear

emoji (👂).

#### Value

a string or vector of strings

## Author(s)

12 create\_subannotation

## **Description**

Create boundaries in a texgrid tier

#### Usage

```
create_subannotation(
  textgrid,
  tier = 1,
  new_tier_name = "",
  n_of_annotations = 4,
  each = 1,
  omit_blank = TRUE,
  overwrite = TRUE
)
```

## **Arguments**

```
textgrid character with a filename or path to the TextGrid

tier value that could be either ordinal number of the tier either name of the tier

new_tier_name a name of a new created tier

n_of_annotations

number of new annotations per annotation to create

each non-negative integer. Each new blank annotation is repeated every first, second or ... times

omit_blank logical. If TRUE (by dafault) it doesn't create subannotation for empy annotations.

overwrite logical. If TRUE (by dafault) it overwrites an existing tier.
```

#### Value

a string that contain TextGrid. If argument write is TRUE, then no output.

#### Author(s)

George Moroz <agricolamz@gmail.com>

```
create_subannotation(system.file("extdata", "test.TextGrid",
   package = "phonfieldwork"
),
tier = 1, overwrite = FALSE
)
```

create\_viewer 13

#### **Description**

Creates an html file with table and sound preview and player

## Usage

```
create_viewer(
  audio_dir,
  picture_dir = NULL,
  table,
  captions = NULL,
  sorting_columns = NULL,
  about = "Created with the `phonfieldworks` package (Moroz 2020).",
  map = FALSE,
  output_dir,
  output_file = "stimuli_viewer",
  render = TRUE
)
```

#### **Arguments**

audio\_dir path to the directory with sounds picture\_dir path to the directory with pictures

table data frame with data ordered according to files in the audio folder captions vector of strings that will be used for captions for a picture.

sorting\_columns

vector of strings for sorting the result column

about it is either .Rmd file or string with the text for about information: author, project,

place of gahtered information and other metadata, version of the viewer and so

on

map the logical argument, if TRUE and there is a glottocode column in table

output\_dir the output directory for the rendered file

output\_file the name of the result .html file (by default stimuli\_viewer)

render the logical argument, if TRUE renders the created R Markdown viewer to the

output\_dir folder, otherwise returns the path to the temporary file with a .csv

file.

#### Value

If render is FALSE, the function returns a path to the temporary file with .csv file. If render is TRUE, there is no output in a function.

df\_to\_eaf

## Author(s)

George Moroz <agricolamz@gmail.com>

 $df\_to\_eaf$ 

Dataframe to .eaf

## **Description**

Convert a dataframe to Elan file .exb

## Usage

```
df_to_eaf(df, output_file, output_dir = "", ref_file = "", mime_type = "")
```

# Arguments

df	an R dataframe object that contains columns named 'tier', 'id', 'tier_name', 'content', 'time_start', 'time_end' and preferably also 'tier_type', 'stereotype', 'tier_ref', 'event_local_id', 'dependent_on' that are specific for eaf file
output_file	the name of the result .xml file
output_dir	the output directory for the rendered file (defalut is used if not spectified)
ref_file	a filepath for connected media file (not obligatory)
<pre>mime_type</pre>	a MIME type of connected media file (not obligatory)

#### Value

.xml file

# Author(s)

Sergej Kudrjashov <xenomirant@gmail.com>

 $df_{to}=xb$ 

df\_to\_exb

Dataframe to EXMARaLDA's .exb

## Description

Convert a dataframe to EXMARaLDA's .exb

#### Usage

```
df_to_exb(
   df,
   name,
   output_file,
   output_dir = "",
   referenced_file = "",
   ud_meta = NULL,
   speaker_table = NULL
)
```

#### **Arguments**

```
df
                  an R dataframe object that contains columns named 'tier', 'tier_name', 'con-
                  tent', 'time_start', 'time_end' and 'id'
                  transcription name
name
output_file
                  the name of the result .html file
output_dir
                  the output directory for the rendered file
referenced_file
                  a filepath for .wav
ud_meta
                  a vector ('key':'value') of meta information (not obligatory)
speaker_table
                  a table with speaker information; must include columns 'id', 'abbreviation',
                   'sex' (not obligatory)
```

#### Value

.xml file

#### Author(s)

Valeria Buntiakova <valleriabun@gmail.com>

df\_to\_tier

```
speaker_data <- data.frame('id' = c('SPK0', 'SPK1', 'SPK2'),</pre>
                            'abbreviation' = c('PAR', 'VIC', 'DAV'),
                            'sex' = c('m', 'f', 'm'),
                            'Family: Marital status' = c('Verheiratet',
                                                         'Verheiratet',
                                                         'Verheiratet'),
                            'Birth' = c('28. März 1935 in Cudworth',
                                        '14. April 1974 in Hertfordshire',
                                        '2. Mail 1975 in London'),
                            'Occupation' = c('Fernsehmoderator, Journalist, Autor',
                                             'Sängerin',
                                             'Professioneller Fußballspieler'),
                      'Family: Children' = c(3, '3 Söhn, 1 Tochter', '3 Söhne, 1 Tochter'),
                     'Name' = c('Michael Parkinson', 'Victoria Beckham', 'David Beckham'))
df <- exb_to_df(system.file("extdata", "demo_Beckhams.exb", package = "phonfieldwork"))</pre>
df_{to}=df
          name = 'Beckhams',
          output_file = 'beck.xml',
          referenced_file = 'beck.wav',
          ud_meta = meta,
          speaker_table = speaker_data)
# Remove file in order to pass checks
file.remove("beck.xml")
```

df\_to\_tier

Dataframe to TextGrid's tier

## **Description**

Convert a dataframe to a Praat TextGrid.

#### Usage

```
df_to_tier(df, textgrid, tier_name = "", overwrite = TRUE)
```

#### **Arguments**

df	an R dataframe object that contains columns named "content", "time_start" and "time_end"
textgrid	a character with a filename or path to the TextGrid
tier_name	a vector that contain a name for a created tier
overwrite	a logic argument, if TRUE overwrites the existing TextGrid file

draw\_sound 17

#### Value

If overwrite is FALSE, then the function returns a vector of strings with a TextGrid. If overwrite is TRUE, then no output.

#### Author(s)

George Moroz <agricolamz@gmail.com>

#### **Examples**

```
time_start <- c(0.00000000, 0.01246583, 0.24781914, 0.39552363, 0.51157715)
time_end <- c(0.01246583, 0.24781914, 0.39552363, 0.51157715, 0.65267574)
content <- c("", "T", "E", "S", "T")
df_to_tier(data.frame(id = 1:5, time_start, time_end, content),
    system.file("extdata", "test.TextGrid",
        package = "phonfieldwork"
    ),
    overwrite = FALSE
)</pre>
```

draw\_sound

Draw Oscilogram, Spectrogram and annotation

#### **Description**

Create oscilogram and spectrogram plot.

## Usage

```
draw_sound(
  file_name,
  annotation = NULL,
  from = NULL,
  to = NULL,
  zoom = NULL,
  text_size = 1,
  output_file = NULL,
  title = NULL,
  freq_scale = "kHz",
  frequency_range = c(0, 5),
  dynamic_range = 50,
  window_length = 5,
  window = "kaiser",
 windowparameter = -1,
  preemphasisf = 50,
  spectrum_info = TRUE,
  raven_annotation = NULL,
  formant_df = NULL,
```

18 draw\_sound

```
pitch = NULL,
pitch_range = c(75, 350),
intensity = NULL,
output_width = 750,
output_height = 500,
output_units = "px",
sounds_from_folder = NULL,
textgrids_from_folder = NULL,
pic_folder_name = "pics",
title_as_filename = TRUE,
prefix = NULL,
suffix = NULL,
autonumber = FALSE
)
```

#### **Arguments**

file\_name a sound file

annotation a source for annotation files (path to TextGrid file or dataframe created from

other linguistic types, e. g. via textgrid\_to\_df(), eaf\_to\_df() or other

functions)

from Time in seconds at which to start extraction.

to Time in seconds at which to stop extraction.

zoom numeric vector of zoom window time (in seconds). It will draw the whole os-

cilogram and part of the spectrogram.

text\_size numeric, text size (default = 1).

output\_file the name of the output file

title the title for the plot

freq\_scale a string indicating the type of frequency scale. Supported types are: "Hz" and

"kHz".

frequency\_range

vector with the range of frequencies to be displayed for the spectrogram up to a

maximum of fs/2. By default this is set to 0-5 kHz.

dynamic\_range values greater than this many dB below the maximum will be displayed in the

same color

window\_length the desired analysis window length in milliseconds.

window A string indicating the type of window desired. Supported types are: "rectangu-

lar", "hann", "hamming", "cosine", "bartlett", "gaussian", and "kaiser".

windowparameter

The parameter necessary to generate the window, if appropriate. At the moment, the only windows that require parameters are the Kaiser and Gaussian windows.

By default, these are set to 2 for kaiser and 0.4 for gaussian windows.

preemphasis of 6 dB per octave is added to frequencies above the specified fre-

quency. For no preemphasis, set to a frequency higher than the sampling fre-

quency.

draw\_sound 19

spectrum\_info logical. If TRUE then add information about window method and params.

raven\_annotation

Raven (Center for Conservation Bioacoustics) style annotations (boxes over spectrogram). The dataframe that contains time\_start, time\_end, freq\_low and freq\_high columns. Optional columns are colors and content.

formant\_df dataframe with formants from formant\_to\_df() function

pitch path to the Praat '.Pitch' file or result of pitch\_to\_df() function. This variable

provide data for visualisation of a pitch contour exported from Praat.

pitch\_range vector with the range of frequencies to be displayed. By default this is set to

75-350 Hz.

intensity path to the Praat '.Intensity' file or result of intensity\_to\_df() function. This

variable provide data for visualisation of an intensity contour exported from

Praat.

output\_width the width of the device
output\_height the height of the device

output\_units the units in which height and width are given. Can be "px" (pixels, the default),

"in" (inches), "cm" or "mm".

sounds\_from\_folder

path to a folder with multiple sound files. If this argument is not NULL, then the function goes through all files and creates picture for all of them.

textgrids\_from\_folder

path to a folder with multiple .TextGrid files. If this argument is not NULL, then

the function goes through all files and create picture for all of them.

pic\_folder\_name

name for a folder, where all pictures will be stored in case sounds\_from\_folder

argument is not NULL

title\_as\_filename

logical. If true adds filename title to each picture

prefix prefix for all file names for created pictures in case sounds\_from\_folder argu-

ment is not NULL

suffix suffix for all file names for created pictures in case sounds\_from\_folder argu-

ment is not NULL

autonumber if TRUE automatically add number of extracted sound to the file name. Prevents

from creating a duplicated files and wrong sorting.

#### Value

Oscilogram and spectrogram plot (and possibly TextGrid annotation).

#### Author(s)

20 draw\_spectrogram

#### **Examples**

```
draw_sound(system.file("extdata", "test.wav", package = "phonfieldwork"))
 system.file("extdata", "test.wav", package = "phonfieldwork"),
 system.file("extdata", "test.TextGrid",
   package = "phonfieldwork"
)
draw_sound(system.file("extdata", "test.wav", package = "phonfieldwork"),
 system.file("extdata", "test.TextGrid", package = "phonfieldwork"),
 pitch = system.file("extdata", "test.Pitch",
   package = "phonfieldwork"
 ),
 pitch_range = c(50, 200)
)
draw_sound(system.file("extdata", "test.wav", package = "phonfieldwork"),
 system.file("extdata", "test.TextGrid", package = "phonfieldwork"),
 pitch = system.file("extdata", "test.Pitch",
   package = "phonfieldwork"
 pitch_range = c(50, 200),
 intensity = intensity_to_df(system.file("extdata", "test.Intensity",
   package = "phonfieldwork"
 ))
)
draw_sound(system.file("extdata", "test.wav", package = "phonfieldwork"),
 formant_df = formant_to_df(system.file("extdata", "e.Formant",
   package = "phonfieldwork"
 ))
)
```

draw\_spectrogram

Draw spectrograms

## Description

This function was slightly changed from phonTools::spectrogram(). Argument description is copied from phonTools::spectrogram().

# Usage

```
draw_spectrogram(
  sound,
  fs = 22050,
  text_size = 1,
  window_length = 5,
```

draw\_spectrogram 21

```
dynamic_range = 50,
window = "kaiser",
windowparameter = -1,
freq_scale = "kHz",
spectrum_info = TRUE,
timestep = -1000,
padding = 10,
preemphasisf = 50,
frequency_range = c(0, 5),
nlevels = dynamic_range,
x_axis = TRUE,
title = NULL,
raven_annotation = NULL,
formant_df = NULL
```

#### **Arguments**

sound Either a numeric vector representing a sequence of samples taken from a sound

wave or a sound object created with the loadsound() or makesound() functions.

fs The sampling frequency in Hz. If a sound object is passed this does not need to

be specified.

text\_size numeric, text size (default = 1).

window\_length The desired analysis window length in milliseconds.

dynamic\_range Values greater than this many dB below the maximum will be displayed in the

same color.

window A string indicating the type of window desired. Supported types are: rectangu-

lar, hann, hamming, cosine, bartlett, gaussian, and kaiser.

windowparameter

The parameter necessary to generate the window, if appropriate. At the moment, the only windows that require parameters are the Kaiser and Gaussian windows.

By default, these are set to 2 for kaiser and 0.4 for gaussian windows.

freq\_scale a string indicating the type of frequency scale. Supported types are: "Hz" and

"kHz".

spectrum\_info logical. If TRUE then add information about window method and params.

timestep If a negative value is given, -N, then N equally-spaced time steps are calculated.

If a positive number is given, this is the spacing between adjacent analyses, in

milliseconds.

padding The amount of zero padding for each window, measured in units of window

length. For example, if the window is 50 points, and padding = 10, 500 zeros

will be appended to each window.

preemphasis of 6 dB per octave is added to frequencies above the specified fre-

quency. For no preemphasis, set to a frequency higher than the sampling fre-

quency.

eaf\_to\_df

frequency\_range

vector with the range of frequencies to be displayed for the spectrogram up to a

maximum of fs/2. This is set to 0-5 kHz by default.

nlevels The number of divisions to be used for the z-axis of the spectrogram. By default

it is set equal to the dynamic range, meaning that a single color represents 1 dB

on the z-axis.

x\_axis If TRUE then draw x axis. title Character with the title.

raven\_annotation

Raven (Center for Conservation Bioacoustics) style annotations (boxes over spectrogram). The dataframe that contains time\_start, time\_end, freq\_low

and freq\_high columns. Optional columns are colors and content.

formant\_df dataframe with formants from formant\_to\_df() function

#### Value

Plot the comptued spectrogram

#### Author(s)

Santiago Barreda <sbarreda@ucdavis.edu>

#### **Examples**

```
draw_spectrogram(system.file("extdata", "test.wav",
  package = "phonfieldwork"
))
```

eaf\_to\_df

ELAN's .eaf file to dataframe

#### **Description**

Convert .eaf file from ELAN to a dataframe.

## Usage

```
eaf_to_df(file_name)
```

## **Arguments**

file\_name

string with a filename or path to the .eaf file

exb\_to\_df 23

#### Value

a dataframe with columns: tier, id, content, tier\_name, tier\_type, tier\_ref, event\_local\_id, dependent\_on, time\_start, time\_end, source, media\_url and attributes: MEDIA\_URL, MIME\_TYPE, RELATIVE\_MEDIA\_URL.

#### Author(s)

```
George Moroz <agricolamz@gmail.com>
```

Kudrjashov Sergej < xenomirant@gmail.com>

## **Examples**

```
eaf_to_df(system.file("extdata", "test.eaf", package = "phonfieldwork"))
```

exb\_to\_df

EXMARaLDA's .exb file to dataframe

## **Description**

Convert .exb file from EXMARaLDA to a dataframe.

#### Usage

```
exb_to_df(file_name)
```

## **Arguments**

file\_name

string with a filename or path to the .exb file

#### Value

```
a dataframe with columns: tier, id, content, tier_name, tier_type, tier_category, tier_speaker, time_start, time_end, source.
```

## Author(s)

George Moroz <agricolamz@gmail.com>

```
exb_to_df(system.file("extdata", "test.exb", package = "phonfieldwork"))
```

24 extract\_intervals

extract\_intervals

Extract intervals

#### **Description**

Extract sound according to non-empty annotated intervals from TextGrid and create soundfiles with correspondent names.

#### Usage

```
extract_intervals(
   file_name,
   textgrid,
   tier = 1,
   prefix = NULL,
   suffix = NULL,
   autonumber = TRUE,
   path
)
```

# Arguments

file\_name path to the soundfile textgrid path to the TextGrid

tier tier number or name that should be used as base for extraction and names

prefix character vector containing prefix(es) for file names suffix character vector containing suffix(es) for file names

autonumber if TRUE automatically add number of extracted sound to the file\_name. Prevents

from creating a duplicated files and wrong sorting.

path path to the directory where create extracted soundfiles.

#### Value

no output

#### Author(s)

George Moroz <agricolamz@gmail.com>

```
# create two files in a temprary folder "test_folder"
s <- system.file("extdata", "test.wav", package = "phonfieldwork")
tdir <- tempdir()
file.copy(s, tdir)</pre>
```

flextext\_to\_df 25

```
# Extract intervals according the TextGrid into the path
extract_intervals(
   file_name = paste0(tdir, "/test.wav"),
   textgrid = system.file("extdata", "test.TextGrid",
      package = "phonfieldwork"
   ),
   path = tdir
)
list.files(tdir)
# [1] "e-2.wav" "s-3.wav" "t-1.wav" "t-4.wav" "test.wav"
```

flextext\_to\_df

FLEX's .flextext file to dataframe

#### **Description**

Convert .flextext file from FLEX to a dataframe.

## Usage

```
flextext_to_df(file_name)
```

#### **Arguments**

file\_name

string with a filename or path to the .flextext file

#### Value

```
a dataframe with columns: p_id, s_id, w_id, txt, cf, hn, gls, msa, morph, word, phrase, paragraph, free\_trans, text, text\_title
```

#### Author(s)

George Moroz <agricolamz@gmail.com>

formant\_to\_df

Praat Formant object to dataframe

#### **Description**

Convert a Praat Formant object to a dataframe.

## Usage

```
formant_to_df(file_name)
```

26 get\_sound\_duration

## **Arguments**

file\_name string with a filename or path to the Formant file

#### Value

```
a dataframe with columns: time_start, time_end, frequency, bandwidth and formant
```

## Author(s)

George Moroz <agricolamz@gmail.com>

## **Examples**

```
formant_to_df(system.file("extdata", "e.Formant", package = "phonfieldwork"))
```

get\_sound\_duration

Get file(s) duration

# Description

Calculate sound(s) duration.

#### Usage

```
get_sound_duration(file_name)
```

# Arguments

file\_name a sound file

## Value

Dataframe with two columns: file name and duration

## Author(s)

George Moroz <agricolamz@gmail.com>

```
get_sound_duration(
  system.file("extdata", "test.wav", package = "phonfieldwork")
)
```

get\_textgrid\_names 27

get\_textgrid\_names

Extract TextGrid names

# Description

Extract TextGrid names.

## Usage

```
get_textgrid_names(textgrid)
```

## **Arguments**

textgrid

path to the TextGrid

#### Value

return a vector of tier names from given TextGrid

#### Author(s)

George Moroz <agricolamz@gmail.com>

## **Examples**

```
get_textgrid_names(system.file("extdata", "test.TextGrid",
   package = "phonfieldwork"
))
```

intensity\_to\_df

Praat Intensity tier to dataframe

# Description

Convert a Praat Intensity tier to a dataframe.

## Usage

```
intensity_to_df(file_name)
```

# Arguments

file\_name

string with a filename or path to the Intensity tier

## Value

```
a dataframe with columns: time_start, time_end, Intensity
```

pitch\_to\_df

#### Author(s)

George Moroz <agricolamz@gmail.com>

## **Examples**

```
intensity_to_df(system.file("extdata", "test.Intensity", package = "phonfieldwork"))
```

pitch\_to\_df

Praat Pitch tier to dataframe

## **Description**

Convert a Praat Pitch tier to a dataframe.

## Usage

```
pitch_to_df(file_name, candidates = "")
```

## **Arguments**

file\_name string with a filename or path to the Pitch tier

candidates Praat Pitch tier contains multiple candidates for each time slice, use the value

"all" if you want to get them all

## Value

```
a dataframe with columns: time_start, time_end, frequency and, if candidates = "all", candidate_id and strength
```

#### Author(s)

George Moroz <agricolamz@gmail.com>

```
pitch_to_df(system.file("extdata", "test.Pitch", package = "phonfieldwork"))
```

read\_from\_folder 29

read\_from\_folder

Read multiple files from the folder

#### **Description**

This function reads multiple files from the folder. The first argument is the path, the second argument is the type of files to read.

#### Usage

```
read_from_folder(path, type = "textgrid")
```

#### **Arguments**

path to a folder with multiple sound files.

type should be one of the following: "duration", "audacity", "eaf", "exb", "flextext",

"formant", "intensity", "picth", "srt", "textgrid"

#### Value

dataframe with contents of all files of a selected type

#### Author(s)

George Moroz <agricolamz@gmail.com>

#### **Examples**

```
read_from_folder(system.file("extdata", package = "phonfieldwork"), "eaf")
```

remove\_textgrid\_tier Remove tier from texgrid

## **Description**

Remove tier from texgrid

## Usage

```
remove_textgrid_tier(textgrid, tier, overwrite = TRUE)
```

## Arguments

textgrid character with a filename or path to the TextGrid

tier value that could be either ordinal number of the tier either name of the tier

overwrite logical. If TRUE (by dafault) it overwrites an existing tier.

30 rename\_soundfiles

## Value

a string that contain TextGrid. If argument write is TRUE, then no output.

rename\_soundfiles

Rename soundfiles

# Description

Rename soundfiles using the template from user.

# Usage

```
rename_soundfiles(
   stimuli,
   translations = NULL,
   prefix = NULL,
   suffix = NULL,
   order = NULL,
   missing = NULL,
   path,
   autonumbering = TRUE,
   backup = TRUE,
   logging = TRUE
)
```

## **Arguments**

stimuli	character vector of stimuli
translations	character vector of translations (optonal). This values are added after stimuli to the new files' names so the result will bestimulus_translation
prefix	character vector of length one containing prefix for file names
suffix	character vector of length one containing suffix for file names
order	numeric vector that define the order of stimuli. By default the order of the stimuli is taken.
missing	numeric vector that define missing stimuli in case when some stimuli are not recorded.
path	path to the directory with soundfiles.
autonumbering	logical. If TRUE, function creates an automatic numbering of files.
backup	logical. If TRUE, function creates backup folder with all files. By default is TRUE.
logging	logical. If TRUE creates a .csv file with the correspondences of old names and new names. This could be useful for restoring in case something goes wrong.

set\_textgrid\_names 31

## Value

no output

#### Author(s)

George Moroz <agricolamz@gmail.com>

set\_textgrid\_names

Rewrite TextGrid names

## **Description**

Rewrite TextGrid names.

## Usage

```
set_textgrid_names(textgrid, tiers, names, write = TRUE)
```

# Arguments

textgrid path to the TextGrid

tiers integer vector with the number of tiers that should be named

names vector of strings with new names for TextGrid tiers

write logical. If TRUE (by dafault) it overwrites an existing tier

#### Value

a string that contain TextGrid. If argument write is TRUE, then no output.

#### Author(s)

George Moroz <agricolamz@gmail.com>

```
set_textgrid_names(system.file("extdata", "test.TextGrid",
   package = "phonfieldwork"
),
tiers = 3, names = "new_name", write = FALSE
```

32 textgrid\_to\_df

srt\_to\_df

Subtitles .srt file to dataframe

# Description

Convert subtitles .srt file to a dataframe.

## Usage

```
srt_to_df(file_name)
```

## **Arguments**

file\_name

string with a filename or path to the .srt file

#### Value

```
a dataframe with columns: id, content, time_start, time_end, source.
```

## Author(s)

George Moroz <agricolamz@gmail.com>

# **Examples**

```
srt_to_df(system.file("extdata", "test.srt", package = "phonfieldwork"))
```

textgrid\_to\_df

TextGrid to dataframe

## **Description**

Convert Praat TextGrid to a dataframe.

# Usage

```
textgrid_to_df(file_name)
```

## **Arguments**

file\_name

string with a filename or path to the TextGrid

## Value

a dataframe with columns: id, time\_start, time\_end (if it is an interval tier — the same as the start value), content, tier, tier\_name and source

tier\_to\_df

#### Author(s)

George Moroz <agricolamz@gmail.com>

#### **Examples**

```
textgrid_to_df(system.file("extdata", "test.TextGrid",
   package = "phonfieldwork"
))
# this is and example of reading a short .TextGrid format
textgrid_to_df(system.file("extdata", "test_short.TextGrid",
   package = "phonfieldwork"
))
```

tier\_to\_df

TextGrid's tier to dataframe

## **Description**

Convert selected tier from a Praat TextGrid to a dataframe.

## Usage

```
tier_to_df(file_name, tier = 1)
```

## **Arguments**

file\_name string with a filename or path to the TextGrid
tier value that could be either ordinal number of the tier either name of the tier. By
default is '1'.

# Value

```
a dataframe with columns: id, time_start, time_end, content, , tier_name
```

#### Author(s)

George Moroz <agricolamz@gmail.com>

```
tier_to_df(system.file("extdata", "test.TextGrid",
    package = "phonfieldwork"
))
tier_to_df(
    system.file("extdata", "test.TextGrid",
        package = "phonfieldwork"
    ),
    "intervals"
)
```
