Package 'RKorAPClient'

January 10, 2025

```
Title 'KorAP' Web Service Client Package
Version 0.9.0
Description A client package that makes the 'KorAP' web service API accessible from R.
     The corpus analysis platform 'KorAP' has been developed as a scientific tool to make
     potentially large, stratified and multiply annotated corpora, such as the 'German Reference Cor-
     pus DeReKo'
     or the 'Corpus of the Contemporary Romanian Language CoRoLa', accessible for lin-
     guists to let them verify
     hypotheses and to find interesting patterns in real language use.
     The 'RKorAPClient' package provides access to 'KorAP' and the corpora behind it for user-
     as a programmatic alternative to the 'KorAP' web user-interface.
     You can learn more about 'KorAP' and use it directly on 'DeReKo' at <a href="https:">https:</a>
     //korap.ids-mannheim.de/>.
Depends R (>= 3.5.0)

Description

Functions to calculate different collocation association scores between a node (target word) and words in a window around the it. The functions are primarily used by collocationScoreQuery().

Association score functions

pmi: pointwise mutual information

mi2: pointwise mutual information squared (Daille 1994), also referred to as mutual dependency (Thanopoulos et al. 2002)

mi3: pointwise mutual information cubed (Daille 1994), also referred to as log-frequency biased mutual dependency) (Thanopoulos et al. 2002)

logDice: log-Dice coefficient, a heuristic measure that is popular in lexicography (Rychlý 2008)

II: log-likelihood (Dunning 1993) using Stefan Evert's (2004) simplified implementation

association-score-functions 3

Usage

```
defaultAssociationScoreFunctions()
pmi(01, 02, 0, N, E, window_size)
mi2(01, 02, 0, N, E, window_size)
mi3(01, 02, 0, N, E, window_size)
logDice(01, 02, 0, N, E, window_size)
ll(01, 02, 0, N, E, window_size)
```

Arguments

01	observed absolute frequency of node
02	observed absolute frequency of collocate
0	observed absolute frequency of collocation
N	corpus size
Е	expected absolute frequency of collocation (already adjusted to window size)
window_size	total window size around node (left neighbour count + right neighbour count)

Value

association score

ci ci

Examples

ci

Add confidence interval and relative frequency variables

Description

Using prop. test(), ci adds three columns to a data frame:

- 1. relative frequency (f)
- 2. lower bound of a confidence interval (ci.low)
- 3. upper bound of a confidence interval

Convenience function for converting frequency tables to instances per million.

Convenience function for converting frequency tables of alternative variants (generated with as.alternatives=TRUE) to percent.

Converts a vector of query or vc strings to typically appropriate legend labels by clipping off prefixes and suffixes that are common to all query strings.

Experimental convenience function for plotting typical frequency by year graphs with confidence intervals using ggplot2. **Warning:** This function may be moved to a new package.

Usage

```
ci(df, x = totalResults, N = total, conf.level = 0.95)
ipm(df)
percent(df)
queryStringToLabel(data, pubDateOnly = FALSE, excludePubDate = FALSE)
geom_freq_by_year_ci(mapping = aes(ymin = conf.low, ymax = conf.high), ...)
```

ci 5

Arguments

df table returned from frequencyQuery() column with the observed absolute frequency. Х column with the total frequencies conf.level confidence level of the returned confidence interval. Must be a single number between 0 and 1. string or vector of query or vc definition strings data pubDateOnly discard all but the publication date excludePubDate discard publication date constraints mapping Set of aesthetic mappings created by aes() or aes_(). If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.

Details

Given a table with columns f, conf.low, and conf.high, ipm ads a column ipm und multiplies conf.low and conf.high with 10⁶.

Other arguments passed to geom ribbon, geom line, and geom click point.

Value

original table with additional column ipm and converted columns conf.low and conf.high original table with converted columns f, conf.low and conf.high string or vector of strings with clipped off common prefixes and suffixes

See Also

ci is already included in frequencyQuery()

 ${\it collocation} {\it Analysis}, {\it KorAPConnection-method} \\ {\it Collocation\ analysis}$

Description

[Experimental]

Performs a collocation analysis for the given node (or query) in the given virtual corpus.

Usage

```
## S4 method for signature 'KorAPConnection'
collocationAnalysis(
   kco,
   node,
   vc = "",
   lemmatizeNodeQuery = FALSE,
   minOccur = 5,
   leftContextSize = 5,
   rightContextSize = 5,
   topCollocatesLimit = 200,
```

```
searchHitsSampleLimit = 20000,
ignoreCollocateCase = FALSE,
withinSpan = ifelse(exactFrequencies, "base/s=s", ""),
exactFrequencies = TRUE,
stopwords = append(RKorAPClient::synsemanticStopwords(), node),
seed = 7,
expand = length(vc) != length(node),
maxRecurse = 0,
addExamples = FALSE,
thresholdScore = "logDice",
threshold = 2,
localStopwords = c(),
collocateFilterRegex = "^[:alnum:]+-?[:alnum:]*$",
...
```

Arguments

kco KorAPConnection() object (obtained e.g. from new("KorAPConnection")

node target word

vc string describing the virtual corpus in which the query should be performed.

An empty string (default) means the whole corpus, as far as it is license-wise

accessible.

lemmatizeNodeQuery

if TRUE, node query will be lemmatized, i.e. $x \rightarrow [tt/l=x]$

minOccur minimum absolute number of observed co-occurrences to consider a collocate

candidate

leftContextSize

size of the left context window

rightContextSize

size of the right context window

topCollocatesLimit

limit analysis to the n most frequent collocates in the search hits sample

searchHitsSampleLimit

limit the size of the search hits sample

ignoreCollocateCase

logical, set to TRUE if collocate case should be ignored

withinSpan KorAP span specification (see https://korap.ids-mannheim.de/doc/ql/poligarp-plus?

embedded=true#spans) for collocations to be searched within. Defaults to

base/s=s.

exactFrequencies

if FALSE, extrapolate observed co-occurrence frequencies from frequencies in

search hits sample, otherwise retrieve exact co-occurrence frequencies

stopwords vector of stopwords not to be considered as collocates

seed seed for random page collecting order

expand if TRUE, node and vc parameters are expanded to all of their combinations

maxRecurse apply collocation analysis recursively maxRecurse times If TRUE, examples for instances of collocations will be added in a column addExamples example. This makes a difference in particular if node is given as a lemma query. thresholdScore association score function (see association-score-functions) to use for computing the threshold that is applied for recursive collocation analysis calls threshold minimum value of thresholdScore function call to apply collocation analysis recursively localStopwords vector of stopwords that will not be considered as collocates in the current function call, but that will not be passed to recursive calls collocateFilterRegex allow only collocates matching the regular expression more arguments will be passed to collocationScoreQuery()

Details

The collocation analysis is currently implemented on the client side, as some of the functionality is not yet provided by the KorAP backend. Mainly for this reason it is very slow (several minutes, up to hours), but on the other hand very flexible. You can, for example, perform the analysis in arbitrary virtual corpora, use complex node queries, and look for expression-internal collocates using the focus function (see examples and demo).

To increase speed at the cost of accuracy and possible false negatives, you can decrease search-HitsSampleLimit and/or topCollocatesLimit and/or set exactFrequencies to FALSE.

Note that currently not the tokenization provided by the backend, i.e. the corpus itself, is used, but a tinkered one. This can also lead to false negatives and to frequencies that differ from corresponding ones acquired via the web user interface.

Value

Tibble with top collocates, association scores, corresponding URLs for web user interface queries, etc.

See Also

Other collocation analysis functions: association-score-functions, collocationScoreQuery, KorAPConnection-methsynsemanticStopwords()

```
## Not run:

# Identify the most prominent light verb construction with "in ... setzen".

# Note that, currently, the use of focus function disallows exactFrequencies.
new("KorAPConnection", verbose = TRUE) %>%
    collocationAnalysis("focus(in [tt/p=NN] {[tt/l=setzen]})",
    leftContextSize=1, rightContextSize=0, exactFrequencies=FALSE, topCollocatesLimit=20)

## End(Not run)
```

 $\verb|collocationScoreQuery,KorAPConnection-method|\\$

Query frequencies of a node and a collocate and calculate collocation association scores

Description

Computes various collocation association scores based on frequencyQuery()s for a target word and a collocate.

Usage

```
## S4 method for signature 'KorAPConnection'
collocationScoreQuery(
  kco,
 node,
  collocate,
  vc = "",
  lemmatizeNodeQuery = FALSE,
  lemmatizeCollocateQuery = FALSE,
  leftContextSize = 5,
  rightContextSize = 5,
  scoreFunctions = defaultAssociationScoreFunctions(),
  smoothingConstant = 0.5,
  observed = NA,
  ignoreCollocateCase = FALSE,
  withinSpan = "base/s=s"
)
```

Arguments

kco KorAPConnection() object (obtained e.g. from new("KorAPConnection")

node target word

collocate collocate of target word

٧C string describing the virtual corpus in which the query should be performed. An empty string (default) means the whole corpus, as far as it is license-wise accessible. lemmatizeNodeQuery logical, set to TRUE if node query should be lemmatized, i.e. $x \rightarrow [tt/1=x]$ lemmatizeCollocateQuery logical, set to TRUE if collocate query should be lemmatized, i.e. $x \rightarrow [tt/1=x]$ leftContextSize size of the left context window rightContextSize size of the right context window scoreFunctions named list of score functions of the form function(O1, O2, O, N, E, window_size), see e.g. pmi smoothingConstant smoothing constant will be added to all observed values observed if collocation frequencies are already known (or estimated from a sample) they can be passed as a vector here, otherwise: NA ignoreCollocateCase logical, set to TRUE if collocate case should be ignored withinSpan KorAP span specification (see https://korap.ids-mannheim.de/doc/ql/poligarp-plus? embedded=true#spans) for collocations to be searched within. Defaults to

Value

tibble with query KorAP web request URL, all observed values and association scores

base/s=s.

## End(Not run)
```

 ${\tt corpusStats}, {\tt KorAPConnection-method}$

Fetch information about a (virtual) corpus

Description

Fetch information about a (virtual) corpus

Usage

```
## S4 method for signature 'KorAPConnection'
corpusStats(kco, vc = "", verbose = kco@verbose, as.df = FALSE)
```

Arguments

kco KoraPConnection() object (obtained e.g. from new("KoraPConnection")

vc string describing the virtual corpus. An empty string (default) means the whole corpus, as far as it is license-wise accessible.

verbose logical. If TRUE, additional diagnostics are printed.

as.df return result as data frame instead of as S4 object?

Value

KorAPCorpusStats object with the slots documents, tokens, sentences, paragraphs

```
## Not run:
kco <- new("KorAPConnection")
corpusStats(kco, "pubDate in 2017 & textType=/Zeitung.*/")
## End(Not run)</pre>
```

hc_add_onclick_korap_search

Add KorAP search click events to highchart plots

Description

[Experimental]

Adds on-click events to data points of highcharts that were constructed with frequencyQuery() or collocationScoreQuery(). Clicks on data points then launch KorAP web UI queries for the given query term and virtual corpus in a separate tab.

Usage

```
hc_add_onclick_korap_search(hc)
```

Arguments

hc

A highchart htmlwidget object generated by e.g. frequencyQuery().

Value

The input highchart object with added on-click events.

See Also

```
Other highcharter-helpers: hc_freq_by_year_ci()
```

hc_freq_by_year_ci

hc_freq_by_year_ci

Plot interactive frequency curves with confidence intervals

Description

[Experimental]

Convenience function for plotting typical frequency by year graphs with confidence intervals using highcharter.

Warning: This function may be moved to a new package.

Usage

```
hc_freq_by_year_ci(
   df,
   as.alternatives = FALSE,
   ylabel = if (as.alternatives) "%" else "ipm",
   smooth = FALSE,
   ...
)
```

Arguments

```
df data frame like the value of a frequencyQuery()
as.alternatives

boolean decides whether queries should be treated as mutually exclusive and exhaustive wrt. to some meaningful class (e.g. spelling variants of a certain word form).

ylabel defaults to % if as.alternatives is TRUE and to ipm otherwise.

smooth boolean decides whether the graph is smoothed using the highcharts plot types spline and areasplinerange.

... additional arguments passed to highcharter::hc_add_series()
```

Value

A highchart htmlwidget object containing the frequency plot.

See Also

```
Other highcharter-helpers: hc_add_onclick_korap_search()
```

```
## Not run:
year <- c(1990:2018)
alternatives <- c("macht []{0,3} Sinn", "ergibt []{0,3} Sinn")</pre>
```

14 KorAPConnection-class

```
new("KorAPConnection", verbose = TRUE) %>%
 frequencyQuery(query = alternatives,
                 vc = paste("textType = /Zeit.*/ & pubDate in", year),
                 as.alternatives = TRUE) %>%
 hc_freq_by_year_ci(as.alternatives = TRUE)
kco <- new("KorAPConnection", verbose = TRUE)</pre>
expand_grid(
 condition = c("textDomain = /Wirtschaft.*/", "textDomain != /Wirtschaft.*/"),
 year = (2005:2011)
) %>%

    "[tt/l=Heuschrecke]",
   paste0(.$condition, " & pubDate in ", .$year)
 )) %>%
 hc_freq_by_year_ci()
## End(Not run)
```

KorAPConnection-class Class KorAPConnection

Description

 ${\tt KoraPConnection\ objects\ represent\ the\ connection\ to\ a\ KoraPConnection\ objects\ can\ be\ created\ by\ new("{\tt KoraPConnection"}).}$

Usage

```
## S4 method for signature 'KorAPConnection'
initialize(
    .Object,
    KorAPUrl = "https://korap.ids-mannheim.de/",
    apiVersion = "v1.0",
    apiUrl,
    accessToken = getAccessToken(KorAPUrl),
    userAgent = "R-KorAP-Client",
    timeout = 240,
    verbose = FALSE,
    cache = TRUE
)

## S4 method for signature 'KorAPConnection'
persistAccessToken(kco, accessToken = kco@accessToken)
```

KorAPConnection-class 15

```
clearAccessToken(kco)

## S4 method for signature 'KorAPConnection'
apiCall(
    kco,
    url,
    json = TRUE,
    getHeaders = FALSE,
    cache = kco@cache,
    timeout = kco@timeout
)

## S4 method for signature 'KorAPConnection'
clearCache(kco)

## S4 method for signature 'KorAPConnection'
show(object)
```

Arguments

. Object KorAPConnection object

KorAPUrl URL of the web user interface of the KorAP server instance you want to access.

apiVersion which version of KorAP's API you want to connect to.

apiUrl URL of the KorAP web service.

accessToken OAuth2 access token. For queries on corpus parts with restricted access (e.g. textual queries on IPR protected data), you need to authorize your application

with an access token. How to obtain an access token for the DeReKo KorAP instance is explained in the authorization section of the RKorAPClient Readme

on GitHub.

To use authorization based on an access token in subsequent queries, initialize your KorAP connection with:

```
kco <- new("KorAPConnection", accessToken="<access token>")
```

In order to make the API token persistent for the currently used KorAPUrl (you can have one token per KorAPUrl / KorAP server instance), use:

```
persistAccessToken(kco)
```

This will store it in your keyring using the keyring::keyring-package. Subsequent new("KorAPConnection") calls will then automatically retrieve the token from your keying. To stop using a persisted token, call clearAccessToken(kco). Please note that for DeReKo, authorized queries will behave differently inside and outside the IDS, because of the special license situation. This concerns also cached results which do not take into account from where a request was issued. If you experience problems or unexpected results, please try kco <-new("KorAPConnection", cache=FALSE) or use clearCache() to clear the cache completely.

userAgent user agent string.

16 KorAPConnection-class

timeout tineout in seconds for API requests (this does not influence server internal time-

outs).

verbose logical that decides whether following operations will default to be verbose.

cache logical that decides if API calls are cached locally. You can clear the cache with

clearCache().

kco KorAPConnection object

url request url

json logical that determines if json result is expected

getHeaders logical that determines if headers and content should be returned (as a list)

object KorAPConnection object

Value

KorAPConnection() object that can be used e.g. with corpusQuery()

Slots

KorAPUrl URL of the web user interface of the KorAP server used in the connection.

apiVersion requested KorAP API version.

indexRevision indexRevision code as reported from API via X-Index-Revision HTTP header.

apiUrl full URL of API including version.

accessToken OAuth2 access token.

userAgent user agent string used for connection the API.

timeout tineout in seconds for API requests (this does not influence server internal timeouts)

verbose logical that decides whether operations will default to be verbose.

cache logical that decides if API calls are cached locally.

welcome list containing HTTP response received from KorAP server welcome function.

```

KorAPCorpusStats-class

Class KorAPCorpusStats

Description

KorAPCorpusStats objects can hold information about a corpus or virtual corpus. KorAPCorpusStats objects can be obtained by the corpusStats() method.

Usage

```
## S4 method for signature 'KorAPCorpusStats'
show(object)
```

Arguments

object

KorAPCorpusStats object

Slots

```
vc definition of the virtual corpus
tokens number of tokens
documents number of documents
sentences number of sentences
paragraphs number of paragraphs
webUIRequestUrl link to the web user interface with the current vc definition
```

KorAPQuery-class

Class KorAPQuery

Description

This class provides methods to perform different kinds of queries on the KorAP API server. KorAPQuery objects, which are typically created by the corpusQuery() method, represent the current state of a query to a KorAP server.

corpusQuery performs a corpus query via a connection to a KorAP-API-server

fetchNext fetches the next bunch of results of a KorAP query.

fetchAll fetches all results of a KorAP query.

frequencyQuery combines corpusQuery(), corpusStats() and ci() to compute a table with the relative frequencies and confidence intervals of one ore multiple search terms across one or multiple virtual corpora.

Usage

```
## S4 method for signature 'KorAPQuery'
initialize(
  .Object,

.Object ... korapConnection

KorAPConnection object

request query part of the request URL

vc string describing the virtual corpus in which the query should be performed.

An empty string (default) means the whole corpus, as far as it is license-wise

accessible.

totalResults number of hits the query has yielded

nextStartIndex at what index to start the next fetch of query results fields (meta)data fields that will be fetched for every match.

requestUrl complete URL of the API request

webUIRequestUrl

URL of a web frontend request corresponding to the API request

apiResponse data-frame representation of the JSON response of the API request

hasMoreMatches logical that signals if more query results can be fetched

collectedMatches

matches already fetched from the KorAP-API-server

kco KorAPConnection() object (obtained e.g. from new("KorAPConnection")

query string that contains the corpus query. The query language depends on the ql

parameter. Either query must be provided or KorAPUrl.

KorAPUrl instead of providing the query and vc string parameters, you can also simply

copy a KorAP query URL from your browser and use it here (and in KorAPConnection)

to provide all necessary information for the query.

metadataOnly logical that determines whether queries should return only metadata without any

snippets. This can also be useful to prevent access rewrites. Note that the default value is TRUE. If you want your corpus queries to return not only metadata, but also KWICS, you need to authorize your RKorAPClient application as explained in the authorization section of the RKorAPClient Readme on GitHub and set the

metadataOnly parameter to FALSE.

ql string to choose the query language (see section on Query Parameters in the

Kustvakt-Wiki for possible values.

accessRewriteFatal

abort if query or given vc had to be rewritten due to insufficient rights (not yet

implemented).

verbose print progress information if true

expand logical that decides if query and vc parameters are expanded to all of their

combinations

as.df return result as data frame instead of as S4 object?

context string that specifies the size of the left and the right context returned in snippet

(provided that metadataOnly is set to false and that the necessary access right are met). The format of the context size specification (e.g. 3-token, 3-token) is described in the Service: Search GET documentation of the Kustvakt Wiki. If the parameter is not set, the default context size secification of the KorAP server instance will be used. Note that you cannot overrule the maximum context size

set in the KorAP server instance, as this is typically legally motivated.

kqo object obtained from corpusQuery()
offset start offset for query results to fetch

maxFetch maximum number of query results to fetch

randomizePageOrder

fetch result pages in pseudo random order if true. Use set.seed() to set seed

for reproducible results.

. . . further arguments passed to or from other methods

conf.level confidence level of the returned confidence interval (passed through ci() to

prop.test()).

as.alternatives

LOGICAL that specifies if the query terms should be treated as alternatives. If as.alternatives is TRUE, the sum over all query hits, instead of the respective vc token sizes is used as total for the calculation of relative frequencies.

x KorAPQuery object
object KorAPQuery object

Value

Depending on the as.df parameter, a table or a KorAPQuery() object that, among other information, contains the total number of results in @totalResults. The resulting object can be used to fetch all query results (with fetchAll()) or the next page of results (with fetchNext()). A corresponding URL to be used within a web browser is contained in @webUIRequestUrl Please make sure to check \$collection\$rewrites to see if any unforeseen access rewrites of the query's virtual corpus had to be performed.

The kqo input object with updated slots collectedMatches, apiResponse, nextStartIndex, hasMoreMatches

mergeDuplicateCollocates

Merge duplicate collocate rows and re-calculate association scores and urls

Description

Merge duplicate collocate rows and re-calculate association scores and urls

Usage

```
mergeDuplicateCollocates(...)
```

Arguments

... tibbles with collocate rows returned from collocationAnalysis()

Value

tibble with unique collocate rows

synsemanticStopwords Preliminary synsemantic stopwords function

Description

[Experimental]

Preliminary synsemantic stopwords function to be used in collocation analysis.

Usage

```
synsemanticStopwords(...)
```

Arguments

... future arguments for language detection

Details

Currently only suitable for German. See stopwords package for other languages.

Value

Vector of synsemantic stopwords.

See Also

Other collocation analysis functions: association-score-functions, collocationAnalysis, KorAPConnection-method collocationScoreQuery, KorAPConnection-method

textMetadata, KorAPConnection-method

Retrieve metadata for a text, identified by its sigle (id)

Description

Retrieves metadata for a text, identified by its sigle (id) using the corresponding KorAP API (see Kustvakt Wiki).

Usage

```
## S4 method for signature 'KorAPConnection'
textMetadata(kco, textSigle, verbose = kco@verbose)
```

Arguments

kco KorAPConnection() object (obtained e.g. from new("KorAPConnection"))

textSigle unique text id (concatenation of corpus, document and text ids, separated by /,

e.g.) or vector thereof

verbose logical. If TRUE, additional diagnostics are printed. Defaults to kco@verbose.

Value

Tibble with columns for each metadata property. In case of errors, such as non-existing texts/sigles, the tibble will also contain a column called errors. If there are metadata columns you cannot make sense of, please ignore them. The function simply returns all the metadata it gets from the server.

```
## Not run:
new("KorAPConnection") %>% textMetadata(c("WUD17/A97/08542", "WUD17/B96/57558", "WUD17/A97/08541"))
## End(Not run)
