Package 'iNZightPlots'

October 14, 2023

Type Package

Title Graphical Tools for Exploring Data with 'iNZight'

Version 2.15.3

Description Simple plotting function(s) for exploratory data analysis with flexible options allowing for easy plot customisation. The goal is to make it easy for beginners to start exploring a dataset through simple R function calls, as well as provide a similar interface to summary statistics and inference information. Includes functionality to generate interactive HTML-driven graphs. Used by 'iNZight', a graphical user interface providing easy exploration and visualisation of data for students of statistics, available in both desktop and online versions.

```

```

```
URL https://inzight.nz
```

Depends R (>= 4.0)

Imports boot, chron, colorspace, dichromat, emmeans, expss, grDevices, grid, hexbin, hms, iNZightMR (>= 2.2.7), iNZightTools (>= 1.9), lubridate, magrittr, quantreg, rlang, s20x, scales, stats, stringr, units, survey, utils

Suggests covr, forcats, DBI, dplyr, dbplyr, ggbeeswarm, ggmosaic, ggplot2, ggridges, ggtext, ggthemes, gridSVG (>= 1.7-2), hextri, jsonlite, kableExtra, knitr, plotly, RColorBrewer, RSQLite, testthat, tibble, tidyr, viridis, waffle

| | | |
| can.i | Interact Identify if a plot can be interactive | |

Description

Several iNZightPlots graphs have been enabled with custom interaction, while others make use of the automatic output of 'plotly'. This function returns 'TRUE' if the provided plot has interaction (as determined by iNZight), and 'FALSE' otherwise.

```
can.interact(x)

## Default S3 method:
can.interact(x)

## S3 method for class 'inzplotoutput'
```

construct_call 3

```
can.interact(x)
## S3 method for class 'ggplot'
can.interact(x)
```

Arguments

Х

a plot object returned from a plotting function

Details

Not that, while most 'ggplot2' graphs can be passed to 'plotly', and even though we are using plot.ly directly for some of our ggplot2 graphs, we still only return 'TRUE' if the graph was created by one of the packages in the iNZight collection.

Value

Logical to identify if there is an interactive version

Methods (by class)

- can.interact(default): Default interaction helper (always returns 'FALSE')
- can.interact(inzplotoutput): Graphs from 'iNZightPlot()', many of which have interaction enabled, but some do not (for example, hex plots)
- can.interact(ggplot): Those 'iNZight*' plotting functions which return a 'ggplot2' object and have been tested to work with plotly will be tagged as such; this is just a helper to check for the necessary attribute.

Author(s)

Tom Elliott, Yu Han Soh

Examples

```
can.interact(iNZightPlot(Sepal.Length, data = iris))
```

construct_call

Construct plot call from settings list

Description

Construct plot call from settings list

4 const_palette_names

Usage

```
construct_call(
  settings,
  vartypes,
  data = quote(.dataset),
  design = quote(.design),
  what = c("plot", "summary", "inference")
)
```

Arguments

settings a list of plot settings, similar to inzpar()
vartypes a list of variables types (numeric, factor)
data a data set to pass to the call
design a survey design (can be NULL)

what the type of call to produce

Value

a plot/summary/inference call

Description

This function was misspelled in earlier versions and has been corrected to cont_palette_names, which should be used instead.

Usage

```
const_palette_names()
```

Value

a list of continuous colour palettes

See Also

```
cont_palette_names
```

convert.to.factor 5

convert.to.factor

Convert to Factor

Description

Convert a numeric variable in to a factor with four levels.

Usage

```
convert.to.factor(x)
```

Arguments

Х

a numeric vector

Value

a factor variable

Author(s)

Tom Elliott

Examples

```
f <- convert.to.factor(runif(100, 0, 10))
levels(f)</pre>
```

create

Create plots for iNZight

Description

Create a Plot Object

Usage

```
create(obj, ...)
```

Arguments

obj an object

... additional arguments

Details

This create method is to be used by packages extending 'iNZightPlots', and should not be used by users. The resulting object should have an associated plot method.

Value

an iNZight plot object with class determined by data type

Author(s)

Tom Elliott

Description

Emphasize a level or interval of a colour palette

Usage

```
emphasize_pal_colour(n, k, cat = TRUE, ncat = 5, fn)
```

Arguments

n

| k | the index of the colour to emphasize |
|------|--|
| cat | logical indicator if palette is categorical or numeric |
| ncat | the number of intervals to use for continuous palettes |

the number of colours to draw from the palette

fn the colour palette function to use

Value

a colour palette, with one level emphasized (or range for numeric)

Author(s)

Tom Elliott

Examples

```
pal <- inzpalette("bright")
plot(1:5, pch = 19, col = emphasize_pal_colour(5, 2, fn = pal))</pre>
```

exploreAllPlots 7

exploreAllPlots

Explore all Univariate Plots

Description

Allows easy viewing of every variable in the data set. The user will be prompted to see the next variable.

Usage

```
exploreAllPlots(data)
```

Arguments

data

a data frame

Author(s)

Tom Elliott

Examples

```
if (interactive())
    exploreAllPlots(iris)
```

exploreAllSummaries

Explore all Univariate Summaries

Description

Allows easy access to a summary for every variable in the data set.

Usage

```
exploreAllSummaries(data, ...)
## S3 method for class 'allSummaries'
print(x, ...)
```

Arguments

```
data a data set
```

... additional arguments passed to getPlotSummary()

x an allSummaries object

8 exportHTML

Value

allSummaries object, a concatenation of summaries from all variables

Functions

• print(allSummaries): print method for allSummaries object

Author(s)

Tom Elliott

Examples

```
exploreAllSummaries(iris)
```

exportHTML

ExportHTML

Description

exportHTML is designed to export the iNZight plot as a dynamic, interactive HTML page. Currently only handles single panel plots. Coloured hex plots are currently not available yet.

```
exportHTML(
 file = file.path(dir, "index.html"),
 data,
 local = FALSE,
 dir = tempdir(),
 extra.vars,
## S3 method for class '`function`'
exportHTML(
 file = file.path(dir, "index.html"),
 data = NULL,
 local = FALSE,
 dir = tempdir(),
 extra.vars = NULL,
 width = dev.size()[1],
 height = dev.size()[2],
)
```

exportHTML 9

```
## S3 method for class 'ggplot'
exportHTML(
  file = file.path(dir, "index.html"),
 data = NULL,
 local = FALSE,
 dir = tempdir(),
 extra.vars = NULL,
 mapObj,
)
## S3 method for class 'inzplotoutput'
exportHTML(
 х,
 file = file.path(dir, "index.html"),
  data = NULL,
 local = FALSE,
 dir = tempdir(),
 extra.vars = NULL,
)
```

Arguments

| x | An iNZight plot object that captures iNZight environment |
|------------|--|
| file | Name of temporary HTML file generated (defaults to 'index.html' in a temporary directory, or other as specified using 'dir') |
| data | dataset/dataframe that you wish to investigate and export more variables from |
| local | Logical for creating local files for offline use (default to false) |
| dir | A directory to store the file and output |
| extra.vars | extra variables specified by the user to be exported |
| | extra arguments |
| width | the desired width of the SVG plot |
| height | the desired height of the SVG plot |
| mapObj | iNZightMap object (from iNZightMaps) |

Value

an inzHTML object consisting of a link to an HTML rendering of x with filename file, which can be loaded in the browser (for example using browseURL, or calling the print() method of the returned object.

10 exportSVG

Methods (by class)

- exportHTML(`function`): method for an iNZightPlot-generating function
- exportHTML(ggplot): method for iNZightMaps or other supported ggplot graphs
- exportHTML(inzplotoutput): method for output from iNZightPlot

Author(s)

Yu Han Soh

Examples

```
## Not run:
x <- iNZightPlot(Petal.Width, Petal.Length, data = iris, colby = Species)
exportHTML(x, "index.html")

#to export more variables for scatterplots:
    exportHTML(x, "index.html", data = iris, extra.vars = c("Sepal.Length", "Sepal.Width"))
## End(Not run)</pre>
```

exportSVG

Export iNZightPlots as an SVG

Description

exportSVG is designed to export the iNZight plot as a temporary SVG that is opened in a web browser. The iNZightPlot must be drawn to a graphics device before exporting can occur.

```
exportSVG(x, file = tempfile(fileext = ".svg"), ...)

## S3 method for class '`function`'
exportSVG(
    x,
    file = tempfile(fileext = ".svg"),
    width = dev.size()[1],
    height = dev.size()[2],
    ...
)

## S3 method for class 'inzplotoutput'
exportSVG(x, file = tempfile(fileext = ".svg"), ...)
```

getPlotSummary 11

Arguments

| X | iNZight plot object or function that captures iNZight environment |
|--------|---|
| file | Name of temporary svg file generated (by default: 'inzightplot.svg') $$ |
| | additional arguments |
| width | the width of the plot device |
| height | the height of the plot device |

Value

Opens up an SVG file of x with filename file in a web browser

Methods (by class)

- exportSVG(`function`): method for functions
- exportSVG(inzplotoutput): method for an existing plot object

Author(s)

Yu Han Soh

getPlotSummary

iNZight Plot Summary and Inference

Description

Generate summary or inference information for an iNZight plot

```
getPlotSummary(
 Х,
 y = NULL,
 g1 = NULL,
 g1.level = NULL,
 g2 = NULL,
  g2.level = NULL,
  varnames = list(),
  colby = NULL,
  sizeby = NULL,
  data = NULL,
  design = NULL,
  freq = NULL,
 missing.info = TRUE,
  inzpars = inzpar(),
  summary.type = "summary",
```

12 getPlotSummary

```
table.direction = c("horizontal", "vertical"),
  hypothesis.value = 0,
  hypothesis.alt = c("two.sided", "less", "greater"),
  hypothesis.var.equal = FALSE,
 hypothesis.use.exact = FALSE,
 hypothesis.test = c("default", "t.test", "anova", "chi2", "proportion"),
 hypothesis.simulated.p.value = FALSE,
 hypothesis = list(value = hypothesis.value, alternative = match.arg(hypothesis.alt),
   var.equal = hypothesis.var.equal, use.exact = hypothesis.use.exact, test =
  match.arg(hypothesis.test), simulated.p.value = hypothesis.simulated.p.value),
 survey.options = list(),
 width = 100,
 epi.out = FALSE,
 privacy_controls = NULL,
 html = FALSE,
 env = parent.frame()
)
```

Arguments

| X | a vector (numeric or factor), or the name of a column in the supplied data or design object |
|--------------|---|
| у | a vector (numeric or factor), or the name of a column in the supplied data or design object |
| g1 | a vector (numeric or factor), or the name of a column in the supplied data or design object. This variable acts as a subsetting variable. |
| g1.level | the name (or numeric position) of the level of g1 that will be used instead of the entire data set |
| g2 | a vector (numeric or factor), or the name of a column in the supplied data or design object. This variable acts as a subsetting variable, similar to g1 |
| g2.level | same as g1.level, however takes the additional value "_MULTI", which produces a matrix of g1 by g2 |
| varnames | a list of variable names, with the list named using the appropriate arguments (i.e., list(x = "height", g1 = "gender")) |
| colby | the name of a variable (numeric or factor) to colour points by. In the case of a numeric variable, a continuous colour scale is used, otherwise each level of the factor is assigned a colour |
| sizeby | the name of a (numeric) variable, which controls the size of points |
| data | the name of a data set |
| design | the name of a survey object, obtained from the survey package |
| freq | the name of a frequency variable if the data are frequencies |
| missing.info | logical, if TRUE, information regarding missingness is displayed in the plot |
| inzpars | allows specification of iNZight plotting parameters over multiple plots |
| summary.type | one of "summary" or "inference" |
| | |

getPlotSummary 13

```
table.direction
                  one of 'horizontal' (default) or 'vertical' (useful for many categories)
hypothesis.value
                  H0 value for hypothesis test
hypothesis.alt alternative hypothesis (!=, <, >)
hypothesis.var.equal
                  use equal variance assumption for t-test?
hypothesis.use.exact
                  logical, if TRUE the exact p-value will be calculated (if applicable)
hypothesis.test
                  in some cases (currently just two-samples) can perform multiple tests (t-test or
                  ANOVA)
hypothesis.simulated.p.value
                  also calculate (where available) the simulated p-value
                  either NULL for no test, or missing (in which case above arguments are used)
hypothesis
survey.options additional options passed to survey methods
width
                  width for the output, default is 100 characters
epi.out
                  logical, if TRUE, then odds/rate ratios and rate differences are printed when ap-
                  propriate (y with 2 levels)
privacy_controls
                  optional, pass in confidentialisation and privacy controls (e.g., random rounding,
                  suppression) for microdata
                  logical, it TRUE output will be returned as an HTML page (if supported)
html
                  additional arguments, see inzpar
                  compatibility argument
env
```

Details

Works much the same as iNZightPlot

Value

an inzight.plotsummary object with a print method

Author(s)

Tom Elliott

Examples

iNZightPlot

```
summary.type = "inference", inference.type = "conf",
hypothesis.value = 5)

# if you prefer a formula interface
inzsummary(Sepal.Length ~ Species, data = iris)
inzinference(Sepal.Length ~ Species, data = iris)

## confidentialisation and privacy controls
# random rounding and suppression:
HairEyeColor_df <- as.data.frame(HairEyeColor)
inzsummary(Hair ~ Eye, data = HairEyeColor_df, freq = Freq)
inzsummary(Hair ~ Eye, data = HairEyeColor_df, freq = Freq,
    privacy_controls = list(
        rounding = "RR3",
        suppression = 10
    )
)</pre>
```

iNZightPlot

iNZight Plot

Description

A general plotting function that automatically detects variable type and draws the appropriate plot. It also provides facilities to add inference information to plots, colour- and size-by variables, and can handle survey data.

```
iNZightPlot(
  х,
 y = NULL
 g1 = NULL,
 g1.level = NULL,
 g2 = NULL,
 g2.level = NULL,
  varnames = list(),
  colby = NULL,
  sizeby = NULL,
  symbolby = NULL,
  extra.vars,
  locate = NULL,
  locate.id = NULL,
  locate.col = NULL,
  locate.extreme = NULL,
  locate.same.level = NULL,
 highlight = NULL,
  data = NULL,
```

iNZightPlot 15

```
design = NULL,
 freq = NULL,
 missing.info = TRUE,
 xlab,
 ylab,
 show_units = TRUE,
 new = TRUE,
 inzpars = inzpar(),
 layout.only = FALSE,
 plot = TRUE,
 xaxis = TRUE,
 yaxis = TRUE,
 xlim = NULL,
 ylim = NULL,
 zoombars = NULL,
 hide.legend = FALSE,
 df,
 env = parent.frame(),
)
```

Arguments

| х | a vector (numeric or factor), or the name of a column in the supplied data or design object |
|------------|---|
| у | a vector (numeric or factor), or the name of a column in the supplied data or design object $ \\$ |
| g1 | a vector (numeric or factor), or the name of a column in the supplied data or design object. This variable acts as a subsetting variable. |
| g1.level | the name (or numeric position) of the level of g1 that will be used instead of the entire data set |
| g2 | a vector (numeric or factor), or the name of a column in the supplied data or design object. This variable acts as a subsetting variable, similar to g1 |
| g2.level | same as g1.level, however takes the additional value "_MULTI", which produces a matrix of g1 by g2 $$ |
| varnames | a list of variable names, with the list named using the appropriate arguments (i.e., list(x = "height", g1 = "gender")) |
| colby | the name of a variable (numeric or factor) to colour points by. In the case of a numeric variable, a continuous colour scale is used, otherwise each level of the factor is assigned a colour |
| sizeby | the name of a (numeric) variable, which controls the size of points |
| symbolby | the name of a factor variable to code point symbols |
| extra.vars | the names of any additional variables to be passed through the internal functions to the create and plot methods. |
| locate | variable to label points |

16 iNZightPlot

locate.id id of points (row numbers) to label, or an expression that evaluates as a logical

vector (e.g., x > 5)

locate.col the colour to locate points if a variable is not specified

locate.extreme numeric, the number of extreme points to label (using Mahalanobis' distance)

locate.same.level

name of a variable to label points with same level of as those specified with

'locate.id'

highlight numeric vector consisting of the row numbers/IDs of points to highlight

data the name of a data set

design the name of a survey object, obtained from the survey package freq the name of a frequency variable if the data are frequencies

missing.info logical, if TRUE, information regarding missingness is displayed in the plot

xlab the text for the x-label ylab the text for the y-label

show_units logical, if 'TRUE' (default) units will be shown beside axies and legend variable

labels

new logical, used for compatibility

inzpars allows specification of iNZight plotting parameters over multiple plots

layout.only logical, if TRUE, only the layout is drawn (useful if a custom plot is to be drawn)

plot logical, if FALSE, the plot is not drawn (used by summary)

xaxis logical, whether or not to draw the x-axis yaxis logical, whether or not to draw the y-axis

xlim specify the x limits of the plot ylim specify the y limits of the plot

zoombars numeric, length 2; when drawing a bar plot, if the number of bars is too large,

the user can specify a subset. The first value is the starting point (1 is the first

bar, etc), while the second number is the number of bars to show.

hide.legend logical, if TRUE, the legend will not be drawn

df compatibility argument env compatibility argument

... additional arguments, see inzpar

Details

The main goal of 'iNZightPlots' is to make it easy to beginners to explore a dataset graphically, using a suite of simple arguments to add features to their graph.

The second use of this function is within the companion software 'iNZight', providing a single function call with arguments controlled by the user through a GUI.

Value

An inzightplotoutput object, which contains the information displayed in the plot

inzinference 17

Author(s)

Tom Elliott

Examples

```
iNZightPlot(Species, data = iris)
iNZightPlot(Petal.Width, g1 = Species, data = iris)
iNZightPlot(Sepal.Length, Sepal.Width, data = iris,
    colby = Species)
iNZightPlot(Sepal.Length, Sepal.Width, data = iris,
    colby = Species, trend = c("linear", "quadratic"),
    trend.by = TRUE, trend.parallel = FALSE)

# add inference information
iNZightPlot(Petal.Width, data = iris,
    inference.type = "conf", inference.par = "mean")
iNZightPlot(Petal.Width, data = iris,
    inference.type = "conf", inference.par = "mean",
    bootstrap = TRUE)

# alternatively, use the formula interface
inzplot(Sepal.Length ~ Sepal.Width | Species, data = iris)
```

inzinference

iNZight Inference Method

Description

A generic function used to generate inferential information for objects within the iNZight ecosystem.

```
inzinference(x, ..., env = parent.frame())
## S3 method for class 'formula'
inzinference(
    x,
    data = NULL,
    design = NULL,
    type = c("conf", "comp"),
    ...,
    env = parent.frame()
)
```

18 inzpalette

Arguments

| Χ | An object |
|------|-----------------------------------|
| | additional arguments for methods |
| env | an environment to evaluate things |
| data | Dataset to plotq |

design A survey design to use

type Type type of inference to obtain, one of 'conf' or 'comp' for confidence intervals

and comparison intervals, respectively (currently ignored).

Value

The output depends on the type of input, and consists of a inference object with a print method.

Methods (by class)

• inzinference(formula): Wrapper for getPlotSummary to obtain inference information about a plot

inzpalette iNZight colour palette

Description

Used to obtain a colour palette of a given name. A list of available palettes can be obtained by 'cat_palette_names()' and 'cont_palette_names()'.

Usage

```
inzpalette(palette)
cat_palette_names()
cont_palette_names()
```

Arguments

palette the name of a palette

Value

a colour palette function with single argument 'n'

Functions

- cat_palette_names(): List of categorical colour palettes
- cont_palette_names(): List of continuous colour palettes

inzpar 19

Author(s)

Tom Elliott

Examples

```
plot(1:5, pch = 19, col = inzpalette("bright")(5))
# for a list of palette names
cat_palette_names()
cont_palette_names()
```

inzpar

iNZight Plotting Parameters

Description

Plotting parameters for iNZight Plots

Usage

```
inzpar(..., .viridis = requireNamespace("viridis", quietly = TRUE))
```

Arguments

... If arguments are supplied, then these values are set. If left empty, then
.viridis checks if the viridis package is installed; or can be turned off the default list is returned.

Details

A whole suite of parameters that can be used to fine-tune plots obtained from the iNZightPlot function. The parameters include both plot type, style, and appearance.

'pch' the plotting symbol to be used; default is '21' (circle with fill)

'col.pt' the colour of points. this can either be a single value, or a vector of colours if colby is specified

'col.fun' a function to use for colouring points, etc., or the name of a palette, see inzpalette

'col.emph', 'col.emphn' emphasize the chosen level of a colour by variable. For numeric colour by, col.emphn specifies the number of quantiles to use.

'emph.on.top' if TRUE, emphasised points will be positioned on top

'col.default' the default colour functions, containing a list with entries for 'cat' and 'cont' variables

'col.missing' the colour for missing values; default is a light grey

'reverse.palette' logical, if TRUE the palette will be reversed

'col.method' the method to use for colouring by a variable, one of 'linear' or 'rank'

20 inzpar

'cex' the overall scaling for the entire plot; values less than 1 will make the text and points smaller, while values larger than 1 will magnify everything

'cex.pt' the scaling value for points

'cex.dotpt' the scaling value for points in a dotplot. Note, this is not multiplicative with 'cex.pt'

'cex.lab' the scaling value for the plot labels

'cex.axis' the scaling value for the axis labels

'cex.main' the scaling value for the main plot title

'cex.text' the scaling value for text on the plot

'resize.method' one of 'proportional' (default) or 'emphasize'

'alpha' transparency setting for points; default is 1, 0 is fully transparent

'bg' the background colour for the plot

'grid.lines' logical to control drawing of axis grid lines

'col.grid' if 'grid.lines' is TRUE, this controls the colour of them. The default is 'default', which will choose a colour based on the value of 'bg')

'fill.pt' the fill colour for points; default is "transparent"

'lwd' the line width of lines (for joining points)

'lty' the line type of lines (for joining points)

'lwd.pt' the line width used for points; default is 2

'col.line' the colour of lines used to join points

'col.sub' vector of up to two colours for the background of subplot labels. If only one specified, it is used for both.

'locate.col.def' the default colour for locating points

'highlight.col' colour to use for highlighting points

'jitter' the axes to add jitter to. Takes values "x", "y", or "xy" (default is en empty string, "")

'rugs' the axes to add rugs to. Takes same values as jitter

'trend' a vector containing the trend lines to add to the plot. Possible values are c("linear", "quadratic", "cubic")

'smooth' the smoothing (lowess) for the points. Takes a value between 0 and 1 (the default, 0, draws no smoother)

'smoothby.lty' the line type used for smoothers if trend.by = TRUE

'quant.smooth' if quantile smoothers are desired, they can be specified here as either the quantiles to smooth over (e.g., c(0.25, 0.5, 0.75)), or "default", which uses the sample size to decide on an appropriate set of quantile smoothers

'LOE' logical, if TRUE, then a 1-1 line of equality is drawn

'join' logical, if TRUE, then points are joined by lines

'lines.by logical, if join = TRUE and colby is specified, points are joined by the specified variable

'col.trend' a named list of colours to be used for drawing the lines. The default is list(linear = "blue", quadratic = "red", cubic = "green4")

'lty.trend' a named list of line types for various types of trend lines. The default is list(linear = 1, quadratic = 2, cubic = 3)

inzpar 21

'trend.by' logical, if TRUE, then trend lines are drawn separately for each group specified by colby

'trend.parallel' logical, if TRUE, the trend lines by group are given the same slope; otherwise they are fit independently

'col.smooth' the colour of the smoother

'col.LOE' the colour of the line of equality

'lty.LOE' the line type of the line of equality

'boxplot' logical, if TRUE, a boxplot is drawn with dotplots and histograms

'box.lwd', 'box.col', 'box.fill' the line width, colour, and fill colour for the box plot drawn

'bar.lwd', 'bar.col', 'bar.fill' the line width, colour, and fill colour of bars in a bar plot

'bar.counts' logical, if TRUE bar graphs will display counts instead of percentages (the default)

'full.height' may no longer be necessary ...

'inf.lwd.comp', 'inf.lwd.conf' the line width of comparison and confidence intervals, respectively

'inf.col.comp', 'inf.col.conf' the colour of comparison and confidence intervals, respectively. These take a length 2 vector, where the first element is used for normal inference, while the second is used for bootstrap intervals

'inference.type' the type of inference added to the plot. Possible values are c("comp", "conf")

'inference.par' the parameter which we obtain intervals for. For a dotplot or histogram, this can be either "mean" or "median"; for bar plots it can be "proportion"

'ci.width' the width of confidence intervals, default 0.95 for a 95% confidence interval

'bs.inference' logical, if TRUE, then nonparametric bootstrap simulation is used to obtain the intervals

'min.count' the min count for barplots inference; counts less than this are ignored

'n.boot' the number of bootstrap simulations to perform

'large.sample.size' sample sizes over this value will use a large-sample plot variant (i.e., scatter plots will become hex plots, dot plots become histograms)

'largesample' logical, if TRUE, then the large-sample plot variance is used

'scatter.grid.bins' the number, N, of bins to use for the scatter-grid plot, producing an N x N matrix

'hex.bins' the number of bins to use for hexagonal binning

'hex.style' the style of the hexagons, one of "size" or "alpha"

'hex.diffuse' logical, Pass on rounding error to nearest not-yet-drawn hexes so that rare classes get represented

'hist.bins' the number of bins to use for the histogram (The default NULL uses point size to approximate dot plot)

'quant.cutoff' if quant.smooth = "default", these sample size values are used to determine which quantiles are drawn

'plottype' used to override the default plot type. Possible values, depending on data type, include c("scatter"|"grid"|"hex"|"dot"|"hist")

'matchplots' logical, if TRUE, then the type of plot is kept consistent between different subsets

'match.limits' a vector of two values used to decide whether to use all small-sample or all largesample plots 22 inzplot

```
'xlim' a vector defining the x axis limits (default NULL will use the data)
```

'ylim' a vector defining the y axis limits (default NULL will use the data)

'transform' a list of variable transformations (e.g., list(x = 'log'))

'plot.features' a list containing any additional features for new plots (e.g., maptype)

'round' integer specifying optional rounding of numerical output, default NA (ignored)

'round_percent' integer specifying rounding for percentages (default 2)

'signif' integer specifying number of significant figured in numeric output (default 2). Ignored if round is not NA.

Value

an object of class inzpar.list

Examples

```
# arguments can be passed directly to \code{iNZightPlot}
iNZightPlot(Sepal.Length,
    data = iris, col.pt = "red",
    box.col = "blue", box.fill = "green"
)

# or stored and passed to it (only pars relevant to the current
# plot are used)
mypar <- inzpar(
    col.pt = "red", box.col = "blue", box.fill = "green",
        trend = "linear", trend.by = TRUE
)
inzplot(Sepal.Length ~ Species, data = iris, inzpar = mypar)
iNZightPlot(Sepal.Length, Sepal.Width,
    data = iris, inzpar = mypar,
    colby = Species
)</pre>
```

inzplot

iNZight Plot Method

Description

A generic function used to plot objects within the iNZight ecosystem.

```
inzplot(x, ..., env = parent.frame())
## S3 method for class 'formula'
inzplot(x, data = NULL, design = NULL, ..., env = parent.frame())
```

inzsummary 23

Arguments

| X | A formula in the form of $y \sim x \mid g$. See Details. |
|--------|---|
| | Any arguments to pass to iNZightPlot |
| env | the parent environment to pass to the plot function |
| data | Dataset to plotq |
| design | A survey design to use |

Details

```
inzplot is a simple wrapper around the iNZightPlot function.

There are four options for the formula passed in:

y will produce a plot of the single variable y.

y ~ x will produce a plot of y against x.

y ~ x | g1 will produce a plot of y against x subset by g1.

y ~ x | g1 + g2 will produce a plot of y against x subset by g1 and g2.
```

Value

The output depends on the type of input, but is usually called for the side-effect of producing a plot. An inzightplotoutput object, which contains the information displayed in the plot

iNZightPlot

Examples

inzsummary

iNZight Summary Method

Description

A generic function used to summarize objects within the iNZight ecosystem.

24 mend_call

Usage

```
inzsummary(x, ..., env = parent.frame())
## S3 method for class 'formula'
inzsummary(x, data = NULL, design = NULL, ..., env = parent.frame())
```

Arguments

x An object

additional arguments for methodsenvan environment to evaluate things

data Dataset to plotq

design A survey design to use

Value

The output depends on the type of input, and consists of a summary object with a print method.

Methods (by class)

• inzsummary(formula): Wrapper for getPlotSummary to obtain summary information about a plot

mend_call

Mend a plot call based on valid parameters

Description

Mend a plot call based on valid parameters

Usage

```
mend_call(call, data, design_name, plot)
```

Arguments

call a plot call string, or expression

data the dataset

design_name name of the design, if any

plot the result of inzplot, inzsummary, or inzinference

Value

a plot call with extraneous arguments removed

print.inzHTML 25

| print inzHTML | Print met |
|-----------------|-----------|
| DETENT. INZHIMI | Prini mei |

Print method for 'inzHTML' object

Description

The default action is for the URL to be 'printed' (opened) in the browser, unless 'viewer' is specified as something else. If 'viewer = NULL', then the URL is printed as a character string.

Usage

```
## S3 method for class 'inzHTML'
print(x, viewer = getOption("viewer", utils::browseURL), ...)
```

Arguments

x a URL that will be printed

viewer the viewing function to use to display the URL

... additional arguments

Value

NULL (it's a print function, after all)

Description

Based off Microdata Output Guide 2020 v5-1

Usage

```
snz_privacy_controls(type = c("survey"), weighted = type == "survey", ...)
```

Arguments

type the type of data, used to specify the correct rules. Currently only survey (4.0.1)

data is supported.

weighted logical indicating if the results are a weighted survey design or not.

... additional arguments, used to override defaults

Value

a list of privacy control rules
