Bell 3

Bell Bell States

# Description

The function builds one of the four Bell states, according to the input qubits

# Usage

```
Bell(qubit1, qubit2)
```

## **Arguments**

qubit1 1st input qubit qubit2 2nd input qubit

#### Value

One of the Bell states as a vector depending on the input qubits.

#### References

```
https://en.wikipedia.org/wiki/Bell_state
https://books.google.co.in/books?id=66TgFp2YqrAC&pg=PA25&redir_esc=y
```

# **Examples**

```
init()
Bell(Q$Q0, Q$Q0)
Bell(Q$Q0, Q$Q1)
Bell(Q$Q1, Q$Q0)
Bell(Q$Q1, Q$Q1)
```

CNOT CNOT gate

# Description

This function operates the CNOT gate on a conformable input matrix/vector

## Usage

CNOT(n)

4 col\_count

## **Arguments**

n A vector/matrix

#### Value

A matrix or a vector after performing the CNOT gate operation on a conformable input matrix or a vector.

#### References

```
https://en.wikipedia.org/wiki/Quantum\_logic\_gate \\ http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
```

# **Examples**

init()
CNOT(Q\$I4)
CNOT(Q\$Q11)

col\_count

Number of columns of a vector/matrix

# Description

This function counts the number of columns of a vector or a matrix

## Usage

```
col_count(M)
```

# Arguments

М

A vector/matrix

# Value

An integer that gives the number of columns in a vector or a matrix.

```
init()
col_count(Q$Q11)
col_count(Q$lambda4)
col_count(Q$I2)
```

Fredkin 5

Fredkin

Fredkin Gate

# Description

This function operates the Fredkin gate on a conformable input matrix/vector

## Usage

Fredkin(n)

# **Arguments**

n

A vector/matrix

## Value

A matrix or a vector after performing the Fredkin gate operation on a conformable input matrix or a vector.

#### References

```
https://en.wikipedia.org/wiki/Quantum\_logic\_gate \\ http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
```

# **Examples**

```
init()
Fredkin(Q$I8)
Fredkin(Q$Q110)
```

Hadamard

Hadamard Gate

# Description

This function operates the Hadamard gate on a conformable input matrix/vector

# Usage

Hadamard(n)

IDSDS

## **Arguments**

n

A vector/matrix

#### Value

A matrix or a vector after performing the Hadamard operation on a conformable input matrix or a vector.

#### References

```
https://en.wikipedia.org/wiki/Quantum_logic_gate
http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
```

## **Examples**

```
init()
Hadamard(Q$Q0)
Hadamard(Q$I2)
Hadamard(Hadamard(Q$Q1))
```

**IDSDS** 

Iterated Deletion of Strictly Dominated Strategies algorithm

# Description

This function applies the IDSDS algorithm to result in the equilibrium strategies based on the rationaility of the players. The input parameters are equal dimensional payoff matrices for the first and the second players.

#### Usage

```
IDSDS(P1, P2)
```

#### **Arguments**

P1 Payoff matrix to Alice
P2 Payoff matrix to Bob

## Value

A list consisting of the equilibrium strategies based on the rationality of the players by application of the IDSDS algorithm on P1 and P2.

init 7

#### References

```
https://arxiv.org/abs/1512.06808
https://en.wikipedia.org/wiki/Strategic_dominance
```

#### **Examples**

```
init() Alice <- matrix(c(8, 0, 3, 3, 2, 4, 2, 1, 3), ncol=3, byrow=TRUE) Bob <- matrix(c(6, 9, 8, 2, 1, 3, 8, 5, 1), ncol=3, byrow=TRUE) IDSDS(Alice, Bob)
```

init

Initialization

## **Description**

Builds the parameters in the required environment after initialization

#### Usage

init()

#### Value

No return value, generates the required variables/parameters.

# References

Q$Qt12
Q$Q_minus
Q$lambda4
```

8 NASH

levi\_civita

Levi-Civita symbol

# Description

This function computes the Levi-Civita symbol depending on the permutations of the three inputs, lying in 0 to 2

# Usage

```
levi_civita(i, j, k)
```

# Arguments

```
i an integer 0, 1 or 2j an integer 0, 1 or 2k an integer 0, 1 or 2
```

#### Value

0, 1 or -1 after computing the Levi-Civita symbol depending on the permutations of the three inputs 0, 1 and 2

#### References

```
https://en.wikipedia.org/wiki/Levi-Civita_symbol
```

# **Examples**

```
init()
levi_civita(0, 2, 1)
levi_civita(1, 2, 0)
levi_civita(1, 2, 1)
```

NASH

Nash Equilibrium

# Description

This function finds out the Nash equilibria of the 2-D payoff matrix for the players. The input parameters are equal dimensional payoff matrices for the first and the second players.

PayoffMatrix\_QBOS 9

#### Usage

```
NASH(P1, P2)
```

#### **Arguments**

P1 Payoff matrix to Alice
P2 Payoff matrix to Bob

#### Value

The cell positons of the Nash equilibrium/equilibria as a dataframe from the payoff matrices of the players.

#### References

```
https://arxiv.org/abs/1512.06808
https://en.wikipedia.org/wiki/Nash_equilibrium
```

# Examples

```
init()
Alice <- matrix(c(4, 3, 2, 4, 4, 2, 1, 0, 3, 5, 3, 5, 2, 3, 1, 3), ncol=4, byrow=TRUE)
Bob <- matrix(c(0, 2, 3, 8, 2, 1, 2, 2, 6, 5, 1, 0, 3, 2, 2, 3), ncol=4, byrow=TRUE)
NASH(Alice, Bob)</pre>
```

PayoffMatrix\_QBOS

Quantum Battle of the Sexes game: Payoff Matrix

#### **Description**

This function generates the payoff matrix for the Quantum Battle of Sexes game for all the four combinations of p and q. moves is a list of two possible strategies for each of the players and alpha, beta, gamma are the payoffs for the players corresponding to the choices available to them with the chain of inequalities, alpha>beta>gamma.

## Usage

```
PayoffMatrix_QBOS(moves, alpha, beta, gamma)
```

## **Arguments**

```
moves a list of matrices
alpha a number
beta a number
gamma a number
```

## Value

The payoff matrices for the two players as two elements of a list.

#### References

```
https://arxiv.org/pdf/quant-ph/0506219.pdf
https://arxiv.org/pdf/quant-ph/0208069.pdf
https://arxiv.org/abs/quant-ph/0110096
```

# Examples

```
init()
moves <- list(Q$I2, sigmaX(Q$I2))
PayoffMatrix_QBOS(moves, 5, 3, 1)</pre>
```

PayoffMatrix\_QHawkDove

Quantum Hawk and Dove game: Payoff Matrix

# Description

This function generates the payoff matrix for the Quantum Hawk and Dove game for all the four combinations of p and q. moves is a list of two possible strategies for each of the players and v, j, D are the value of resource, cost of injury and cost of displaying respectively.

#### Usage

```
PayoffMatrix_QHawkDove(moves, v, j, D)
```

### **Arguments**

```
moves a list of matrices
v a number
j a number
D a number
```

## Value

The payoff matrices for the two players as two elements of a list.

#### References

```

https://arxiv.org/pdf/quant-ph/0208069.pdf
https://arxiv.org/pdf/quant-ph/0108075.pdf
```

PayoffMatrix\_QPD 11

### **Examples**

```
init()
moves <- list(Q$I2, sigmaX(Q$I2))
PayoffMatrix_QHawkDove(moves, 50, -100, -10)</pre>
```

PayoffMatrix\_QPD

Quantum Prisoner's Dilemma game: Payoff Matrix

# Description

This function generates the payoff matrix for the Quantum Prisoner's Dilemma game . moves is a list of the possible strategies for each of the players and w, x, y, z are the payoffs for the players corresponding to the choices available to them with the chain of inequalities, z>w>x>y. This function also plots the probability distribution plots of the qubits for all the possible combinations of the strategies of the players.

#### Usage

```
PayoffMatrix_QPD(moves, w, x, y, z)
```

# Arguments

moves	a list of matrices
W	a number
X	a number
У	a number
Z	a number

# Value

The payoff matrices for the two players as two elements of a list.

#### References

```
https://arxiv.org/pdf/quant-ph/0506219.pdf
https://arxiv.org/pdf/quant-ph/0208069.pdf
https://arxiv.org/pdf/quant-ph/0004076.pdf
```

```
init()
moves <- list(Q$I2, sigmaX(Q$I2), Hadamard(Q$I2), sigmaZ(Q$I2))
PayoffMatrix_QPD(moves, 3, 1, 0, 5)</pre>
```

PhaseDagger

Phase

Phase Gate

# Description

This function operates the Phase gate on a conformable input matrix/vector

## Usage

Phase(n)

## **Arguments**

n

a vector/matrix

## Value

A matrix or a vector after performing the Phase gate operation on a conformable input matrix or a vector.

## References

```
https://en.wikipedia.org/wiki/Quantum_logic_gate
http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
```

# **Examples**

```
init()
Phase(Q$I2)
Phase(Q$Q_plus)
```

PhaseDagger

Hermitian Transpose of the Phase Gate

# Description

This function operates the hermitian transpose of the Phase gate on a conformable input matrix/vector

## Usage

PhaseDagger(n)

QBOS 13

## **Arguments**

n a vector/matrix

#### Value

A matrix or a vector after performing the operation of the hermitian transpose of the Phase gate on a conformable input matrix or a vector.

#### References

```
https://en.wikipedia.org/wiki/Quantum_logic_gate
http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
```

## **Examples**

```
init()
Conj(t(Phase(Q$I2)))==PhaseDagger(Q$I2)
PhaseDagger(Q$Q_plus)
```

**QBOS** 

Quantum Battle of the Sexes game

# Description

This function returns the expected payoffs to Alice and Bob with respect to the probabilities p and q. p+q should equal 1 and moves is a list of two possible strategies for each of the players and alpha, beta, gamma are the payoffs for the players corresponding to the choices available to them with the chain of inequalities, alpha>beta>gamma.

# Usage

```
QBOS(p, q, moves, alpha, beta, gamma)
```

#### **Arguments**

р	a real number between 0 and 1 including the end points
q	a real number between 0 and 1 including the end points
moves	alist of matrices
alpha	a number
beta	a number
gamma	a number

14 QDuelsPlot1

#### Value

A vector consisting of the Payoffs to Alice and Bob as its two elements depending on the inputs.

#### References

```
https://arxiv.org/pdf/quant-ph/0506219.pdf
https://arxiv.org/pdf/quant-ph/0208069.pdf
https://arxiv.org/abs/quant-ph/0110096
```

## **Examples**

```
init()
moves <- list(Q$I2, sigmaX(Q$I2))
QBOS(0, 1, moves, 5, 3, 1)
QBOS(1, 1, moves, 5, 3, 1)
QBOS(0.5, 0.5, moves, 5, 3, 1)</pre>
```

QDuelsPlot1

Quantum Two Person Duel game

#### **Description**

This function helps us to plot Alice's and Bob's expected payoffs as functions of alpha1 and alpha2. Psi is the initial state of the quantum game, n is the number of rounds, a is the probability of Alice missing the target, b is the probability of Bob missing the target, and alpha1, alpha2, beta1, beta2 are arbitrary phase factors that lie in -pi to pi that control the outcome of a poorly performing player.

## Usage

```
QDuelsPlot1(Psi, n, a, b, beta1, beta2)
```

## **Arguments**

```
Psi a vector representing the initial quantum state

n an integer

a number

b a number

beta1 a number

beta2 a number
```

## Value

No return value, plots Alice's and Bob's expected payoffs as functions of alpha1 and alpha2.

QDuelsPlot2

#### References

```
https://arxiv.org/pdf/quant-ph/0506219.pdf
https://arxiv.org/pdf/quant-ph/0208069.pdf
https://arxiv.org/pdf/quant-ph/0305058.pdf
```

#### **Examples**

```
init()
QDuelsPlot1(Q$Q10, 2, 0.66666, 0.5, 0.2, 0.8)
```

QDuelsPlot2

Quantum Two Person Duel game

# **Description**

This function helps us to plot Alice's and Bob's expected payoffs as functions of the number of rounds n played in a repeated quantum duel. Psi is the initial state of the quantum game, n is the number of rounds, a is the probability of Alice missing the target, b is the probability of Bob missing the target, and alpha1, alpha2, beta1, beta2 are arbitrary phase factors that lie in -pi to pi that control the outcome of a poorly performing player.

# Usage

```
QDuelsPlot2(Psi, n, a, b, alpha1, alpha2, beta1, beta2)
```

# Arguments

Psi	a vector representing the initial quantum state
n	an integer
а	a number
b	a number
alpha1	a number
alpha2	a number
beta1	a number
beta2	a number

#### Value

No return value, plots Alice's and Bob's expected payoffs as functions of the number of rounds n played in a repeated quantum duel.

16 QDuelsPlot3

#### References

```
https://arxiv.org/pdf/quant-ph/0506219.pdf
https://arxiv.org/pdf/quant-ph/0208069.pdf
https://arxiv.org/pdf/quant-ph/0305058.pdf
```

#### **Examples**

```
init()
QDuelsPlot2(Q$Q01, 10, 0.66666, 0.5, -pi/2, pi/4, 0.6, 0.4)
```

QDuelsPlot3

Quantum Two Person Duel game

## Description

This function helps us to plot the improvement in Alice's expected payoff as a function of a and b, if Alice chooses to fire at the air in her second shot, in a two round game. Psi is the initial state of the quantum game, n is the number of rounds, a is the probability of Alice missing the target, b is the probability of Bob missing the target, and alpha1, alpha2, beta1, beta2 are arbitrary phase factors that lie in -pi to pi that control the outcome of a poorly performing player.

## Usage

```
QDuelsPlot3(Psi, alpha1, alpha2)
```

### **Arguments**

Psi a vector representing the initial quantum state

alpha1 a number alpha2 a number

#### Value

No return value, plots the improvement in Alice's expected payoff as a function of a and b, if Alice chooses to fire at the air in her second shot, in a two round game.

## References

```
https://arxiv.org/pdf/quant-ph/0506219.pdf

```

QDuelsPlot4 17

### **Examples**

```
init()
Qs <- (Q$Q0+Q$Q1)/sqrt(2)
Psi <- kronecker(Q$Q1, Qs)
QDuelsPlot3(Psi, pi/3, pi/6)</pre>
```

QDuelsPlot4

Quantum Two Person Duel game

### **Description**

This function helps us to plot the improvement in Bob's expected payoff as a function of a and b, if Bob chooses to fire at the air in her second shot, in a two round game. Psi is the initial state of the quantum game, n is the number of rounds, a is the probability of Alice missing the target, b is the probability of Bob missing the target, and alpha1, alpha2, beta1, beta2 are arbitrary phase factors that lie in -pi to pi that control the outcome of a poorly performing player.

## Usage

```
QDuelsPlot4(Psi, alpha1, alpha2)
```

#### **Arguments**

Psi a vector representing the initial quantum state

alpha1 a number alpha2 a number

#### Value

No return value, plots the improvement in Bob's expected payoff as a function of a and b, if Bob chooses to fire at the air in her second shot, in a two round game.

## References

```
https://arxiv.org/pdf/quant-ph/0506219.pdf

https://arxiv.org/pdf/quant-ph/0305058.pdf
```

```
init()
Qs <- (Q$Q0+Q$Q1)/sqrt(2)
Psi <- kronecker(Q$Q1, Qs)
QDuelsPlot4(Psi, pi/3, pi/6)</pre>
```

```
QDuels_Alice_payoffs Quantum Two Person Duel game
```

#### **Description**

This function returns the expected payoff to Alice for three possible cases for the Quantum Duel game:

- 1. The game is continued for n rounds and none of the players shoots at the air.
- 2. The game is continued for 2 rounds and Alice shoots at the air in her second round.
- 3. The game is continued for 2 rounds and Bob shoots at the air in her second round.

Psi is the initial state of the quantum game, n is the number of rounds, a is the probability of Alice missing the target, b is the probability of Bob missing the target, and alpha1, alpha2, beta1, beta2 are arbitrary phase factors that lie in -pi to pi that control the outcome of a poorly performing player.

## Usage

```
QDuels_Alice_payoffs(Psi, n, a, b, alpha1, alpha2, beta1, beta2)
```

#### Arguments

Psi	a vector representing the initial quantum state
n	an integer
a	a number
b	a number
alpha1	a number
alpha2	a number
beta1	a number
beta2	a number

#### Value

A list consisting of the payoff value to Alice depending on three situations of the quantum duel game: 1) The game is continued for n rounds and none of the players shoots at the air, 2) The game is continued for 2 rounds and Alice shoots at the air in her second round and 3) The game is continued for 2 rounds and Bob shoots at the air in her second round.

```

QDuels\_Bob\_payoffs 19

### **Examples**

```
init()
QDuels_Alice_payoffs(Q$Q11, 5, 0.666666, 0.5, 0, 0, 0.2, 0.7)
Qs <- (Q$Q0+Q$Q1)/sqrt(2)
Psi <- kronecker(Qs, Qs)
QDuels_Alice_payoffs(Psi, 5, 0.666666, 0.5, 0, 0, 0.2, 0.7)</pre>
```

QDuels\_Bob\_payoffs

Quantum Two Person Duel game

#### **Description**

This function returns the expected payoff to Bob for three possible cases for the Quantum Duel game:

- 1. The game is continued for n rounds and none of the players shoots at the air.
- 2. The game is continued for 2 rounds and Alice shoots at the air in her second round.
- 3. The game is continued for 2 rounds and Bob shoots at the air in her second round.

Psi is the initial state of the quantum game, n is the number of rounds, a is the probability of Alice missing the target, b is the probability of Bob missing the target, and alpha1, alpha2, beta1, beta2 are arbitrary phase factors that lie in -pi to pi that control the outcome of a poorly performing player.

#### Usage

```
QDuels_Bob_payoffs(Psi, n, a, b, alpha1, alpha2, beta1, beta2)
```

## **Arguments**

Psi	a vector representing the initial quantum state
n	an integer
a	a number
b	a number
alpha1	a number
alpha2	a number
beta1	a number
beta2	a number

#### Value

A list consisting of the payoff value to Bob depending on three situations of the quantum duel game: 1) The game is continued for n rounds and none of the players shoots at the air, 2) The game is continued for 2 rounds and Alice shoots at the air in her second round and 3) The game is continued for 2 rounds and Bob shoots at the air in her second round.

QFT

Quantum Fourier Transform

# Description

This function performs Quantum Fourier Transform for a given state |y> from the computational basis to the Fourier basis.

# Usage

QFT(y)

## **Arguments**

y an integer

## Value

A vector representing the Quantum Fourier transformation of the state |y> from the computational basis to the Fourier basis.

## References

```
https://arxiv.org/pdf/quant-ph/0506219.pdf
https://books.google.co.in/books?id=66TgFp2YqrAC&pg=PA25&redir_esc=y

```

## **Examples**

init()
QFT(5)

QHawkDove 21

Quantum Hawk and Dove game

## **Description**

This function returns the expected payoffs to Alice and Bob with respect to the probabilities p and q. p+q should equal 1 and moves is a list of two possible strategies for each of the players and v, j, D are the value of resource, cost of injury and cost of displaying respectively.

# Usage

```
QHawkDove(p, q, moves, v, j, D)
```

## **Arguments**

p	a real number between 0 and 1 including the end points
q	a real number between 0 and 1 including the end points
moves	a list of matrics
V	a number
j	a number
D	a number

# Value

A vector consisting of the expected payoffs to Alice and Bob as its elements calculated according to the probabilities p and q provided as inputs.

#### References

```

QHawkDove(0, 0, moves, 50, -100, -10)</pre>
```

22 QMontyHall

QMeasure

Measurement

#### **Description**

This function performs a projective measurement of a quantum state n, in the computational basis and plots the corresponding probability distributions of the qubits.

#### **Usage**

```
QMeasure(n)
```

## Arguments

n

a vector representing a quantum state

#### Value

No return value, plots the probability distributions of the qubits after performing a projective measurement of a quantum state n.

#### References

```
https://books.google.co.in/books?id=66TgFp2YqrAC&pg=PA25&redir_esc=yhttps://en.wikipedia.org/wiki/Measurement_in_quantum_mechanics
```

# **Examples**

```
init()
QMeasure(Q$Q10110)
```

**QMontyHall** 

Quantum Monty Hall Problem

# Description

This function simulates the quantum version of the Monty Hall problem, by taking in Psi\_in as the initial quantum state of the game, gamma lying in 0 to pi/2, Ahat and Bhat as the choice operators in SU(3) for Alice and Bob respectively as the inputs. It returns the expected payoffs to Alice and Bob after the end of the game.

#### Usage

```
QMontyHall(Psi_in, gamma, Ahat, Bhat)
```

QNewcomb 23

## **Arguments**

Psi\_in a vector representing the initial quantum state

gamma a number between 0 and pi/2 including the end points

Ahat a matrix lying in SU(3)
Bhat a matrix lying in SU(3)

#### Value

A vector consisting of the expected payoffs to Alice and Bob as its elements depending on the input parameters.

#### References

https://arxiv.org/pdf/quant-ph/0208069.pdf
https://arxiv.org/pdf/quant-ph/0109035.pdf
```

## **Examples**

```
init()
Psi_in <- kronecker(Q$Qt0, (Q$Qt00+Q$Qt11+Q$Qt22)/sqrt(3))
QMontyHall(Psi_in, pi/4, Q$Identity3, Q$Hhat)</pre>
```

QNewcomb

Quantum Newcomb's Paradox

## **Description**

This function simulates the quantum version of the Newcomb's Paradox by taking in the choice of the qubit |0> or |1> by the supercomputer Omega and the probability 'probability' with which Alice plays the spin flip operator. It returns the final state of the quantum game along with plotting the probability densities of the qubits of the final state after measurement.

#### **Usage**

```
QNewcomb(Omega, probability)
```

### Arguments

Omega |0> or |1>

probability a real number between 0 and 1 including the end points

#### Value

The final state of the quantum game as a vector along with plotting the probability densities of the qubits of the final state after measurement.

QPD QPD

```

## **Examples**

```
init()
QNewcomb(Q$Q0, 0)
QNewcomb(Q$Q1, 0)
QNewcomb(Q$Q1, 0.7)
```

QPD

Quantum Prisoner's Dilemma game

## **Description**

This function returns the expected payoffs to Alice and Bob, with the strategy moves by Alice and Bob as two of the inputs. w, x, y, z are the payoffs to the players corresponding to the choices available to them with the chain of inequalities, z>w>x>y. This function also plots the probability distribution plots of the qubits for one of all the combinations of the strategies of the players.

## Usage

```
QPD(U_Alice, U_Bob, w, x, y, z)
```

#### **Arguments**

```
U_Alice a matrix lying in SU(2)
U_Bob a matrix lying in SU(2)
w a number
x a number
y a number
z a number
```

## Value

A vector consisting of the expected payoffs to Alice and Bob as its elements according to the strategies played by Alice and Bob and also the payoff values.

```

QPennyFlip 25

### **Examples**

```
init()
QPD(Hadamard(Q$I2), sigmaZ(Q$I2), 3, 1, 0, 5)
```

QPennyFlip

Quantum Penny Flip game

## **Description**

This function simulates the Quantum Penny Flip game by taking in the initial state of the game that is set by Alice and the strategies available to Alice and Bob. It returns the final state of the game along with the plot of the probability distribution of the qubits after measurement of the final state.

#### Usage

```
QPennyFlip(initial_state, strategies_Alice, strategies_Bob)
```

#### **Arguments**

```
\begin{array}{ll} \mbox{initial\_state} & \mbox{a vector representing the initial quantum state} \\ \mbox{strategies\_Alice} & \mbox{a matrix lying in } SU(2) \\ \mbox{strategies\_Bob} & \mbox{a matrix lying in } SU(2) \end{array}
```

## Value

The final state of the game along with the plot of the probability distribution of the qubits after measurement of the final state by taking in the initial state of the game that is set by Alice and the strategies available to Alice and Bob as the inputs.

```

```
init()
psi <- (u+d)/sqrt(2)
S1 <- sigmaX(Q$I2)
S2 <- Q$I2
H <- Hadamard(Q$I2)
SA <- list(S1, S2)
SB <- list(H)
QPennyFlip(psi, SA,SB)</pre>
```

26 Rx

row\_count

Number of rows of a vector/matrix

## **Description**

This function counts the number of rows of a vector or a matrix

# Usage

```
row_count(M)
```

## **Arguments**

М

A vector/matrix

#### Value

An integer that gives the number of rows in a vector or a matrix.

# **Examples**

```
init()
row_count(Q$Q01)
row_count(Q$lambda5)
row_count(Q$Qt12)
```

Rx

Rotation operation about x-axis of the Bloch sphere

# Description

This function operates the Rotation gate about the x-axis of the Bloch sphere by an angle theta on a conformable input matrix n.

# Usage

```
Rx(n, theta)
```

## **Arguments**

n a vector/matrix

theta an angle

Ry 27

#### Value

A vector or a matrix after operating the Rotation gate about the x-axis of the Bloch sphere, by an angle theta, on a conformable input matrix or a vector n

#### References

```

## **Examples**

```
init()
Rx(Q$Q0, pi/6)
```

Ry

Rotation operation about y-axis of the Bloch sphere

## Description

This function operates the Rotation gate about the y-axis of the Bloch sphere by an angle theta on a conformable input matrix n.

## Usage

```
Ry(n, theta)
```

# **Arguments**

```
n a vector/matrix theta an angle
```

#### Value

A vector or a matrix after operating the Rotation gate about the y-axis of the Bloch sphere, by an angle theta, on a conformable input matrix or a vector n.

#### References

28 Rz

## **Examples**

```
init()
Ry(Q$Q1, pi/3)
```

Rz

Rotation operation about z-axis of the Bloch sphere

# Description

This function operates the Rotation gate about the z-axis of the Bloch sphere by an angle theta on a conformable input matrix n.

## Usage

```
Rz(n, theta)
```

## **Arguments**

n a vector/matrix theta an angle

# Value

A vector or a matrix after operating the Rotation gate about the z-axis of the Bloch sphere, by an angle theta, on a conformable input matrix or a vector n.

#### References

```

```
init()
Rz(Q$Q1, pi)
```

sigmaX 29

sigmaX

Pauli-X gate

# Description

This function operates the Pauli-X gate on a conformable input matrix or a vector.

## Usage

```
sigmaX(n)
```

# Arguments

n

a vector/matrix

#### Value

A matrix or a vector after performing the Pauli-X gate operation on a conformable input matrix or a vector.

#### References

```
https://en.wikipedia.org/wiki/Quantum_logic_gate
http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
http://www.physics.udel.edu/~msafrono/650/Lecture%204%20-%205.pdf
```

# **Examples**

```
init()
sigmaX(Q$I2)
sigmaX(Hadamard(Q$I2))
sigmaX(Q$Q1)
```

sigmaY

Pauli-Y gate

## **Description**

This function operates the Pauli-Y gate on a conformable input matrix or a vector.

## Usage

```
sigmaY(n)
```

30 sigmaZ

### **Arguments**

n a vector/matrix

#### Value

A matrix or a vector after performing the Pauli-Y gate operation on a conformable input matrix or a vector.

#### References

```
https://en.wikipedia.org/wiki/Quantum_logic_gate
http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
http://www.physics.udel.edu/~msafrono/650/Lecture%204%20-%205.pdf
```

# **Examples**

```
init()
sigmaY(Q$I2)
sigmaY(Hadamard(Q$I2))
sigmaY(Q$Q0)
```

sigmaZ

Pauli-Z gate

# Description

This function operates the Pauli-Z gate on a conformable input matrix or a vector.

# Usage

```
sigmaZ(n)
```

# **Arguments**

n

a vector/matrix

#### Value

A matrix or a vector after performing the Pauli-Z gate operation on a conformable input matrix or a vector.

SWAP 31

#### References

```

# **Examples**

```
init()
sigmaZ(Q$12)
sigmaZ(Hadamard(Q$12))
sigmaZ(Q$Q0)
```

**SWAP** 

SWAP gate

## **Description**

This function operates the SWAP gate on a conformable input matrix or a vector.

## Usage

SWAP(n)

# Arguments

n

a vector/matrix

#### Value

A matrix or a vector after performing the SWAP gate operation on a conformable input matrix or a vector.

#### References

```
https://en.wikipedia.org/wiki/Quantum\_logic\_gate \\ http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
```

```
init()
SWAP(Q$I4)
SWAP(Q$Q10)
```

32 TDagger

Τ

T gate

# Description

This function operates the T gate on a conformable input matrix or a vector.

## Usage

T(n)

#### **Arguments**

n

a vector/matrix

## Value

A matrix or a vector after performing the T gate operation on a conformable input matrix or a vector.

## References

```
https://en.wikipedia.org/wiki/Quantum_logic_gate
http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
```

# **Examples**

```
init()
T(Q$I2)
T(Q$Q_minus)
```

TDagger

Hermitian Transpose of the T gate

# Description

This function operates the hermitian transpose of the T gate on a conformable input matrix or a vector.

# Usage

TDagger(n)

Toffoli 33

#### **Arguments**

n a vector/matrix

#### Value

A matrix or a vector after performing the operation of the hermitian transpose of the T gate on a conformable input matrix or a vector.

#### References

```
https://en.wikipedia.org/wiki/Quantum_logic_gate
http://www2.optics.rochester.edu/~stroud/presentations/muthukrishnan991/LogicGates.pdf
```

# **Examples**

```
init()
TDagger(Q$I2)
TDagger(Q$Q_plus)
```

Toffoli

Toffoli gate

# Description

This function operates the Toffoli gate on a conformable input matrix or a vector.

#### Usage

Toffoli(n)

#### **Arguments**

n

a vector/matrix

#### Value

A matrix or a vector after performing the Toffoli gate operation on a conformable input matrix or a vector.

#### References

```

34 Walsh

### **Examples**

```
init()
Toffoli(Q$I8)
Toffoli(Q$Q010)
```

Walsh

Walsh-Hadamard gate

# Description

This function operates the Walsh-Hadamard gate on a conformable input matrix or a vector.

# Usage

Walsh(n)

## **Arguments**

n

a vector/matrix

# Value

A matrix or a vector after performing the Walsh-Hadamard gate operation on a conformable input matrix or a vector.

Walsh(Q$Q0)
```

Walsh16 35

Walsh16

Walsh-Hadamard gate

# Description

This function operates the Walsh-16 gate on a conformable input matrix or a vector.

## Usage

```
Walsh16(n)
```

## **Arguments**

n

a vector/matrix

#### Value

A matrix or a vector after performing the Walsh-16 gate operation on a conformable input matrix or a vector.

#### References

init()
Walsh16(Q$I16)
Walsh16(Q$Q1001)
```

Walsh32

Walsh-Hadamard gate

# Description

This function operates the Walsh-32 gate on a conformable input matrix or a vector.

# Usage

Walsh32(n)

36 Walsh4

## **Arguments**

n a vector/matrix

#### Value

A matrix or a vector after performing the Walsh-32 gate operation on a conformable input matrix or a vector.

#### References

# **Examples**

```
init()
Walsh32(Q$I32)
Walsh32(Q$Q10011)
```

Walsh4

Walsh-Hadamard gate

# Description

This function operates the Walsh-4 gate on a conformable input matrix or a vector.

# Usage

```
Walsh4(n)
```

# Arguments

n

a vector/matrix

#### Value

A matrix or a vector after performing the Walsh-4 gate operation on a conformable input matrix or a vector.
