Package 'zenplots'

November 8, 2023

Version 1.0.6

Encoding UTF-8

Title Zigzag Expanded Navigation Plots

Description Graphical tools for visualizing high-dimensional data along a path of alternating one- and two-dimensional plots. Note that this includes interactive graphics plots based on 'loon' in turn based on 'tcltk' (included as part of the standard R distribution). It also requires 'graph' from Bioconductor. For more detail on use and algorithms, see <doi:10.18637/jss.v095.i04>.

Author Marius Hofert [aut], Wayne Oldford [aut, cre]

Maintainer Wayne Oldford < rwoldford@uwaterloo.ca>

URL https://github.com/great-northern-diver/zenplots

Depends R (>= 3.4.0)

Imports grid, graphics, stats, methods, MASS, graph, PairViz

Suggests knitr, rmarkdown, Rgraphviz, ADGofTest, copula, Matrix, pcaPP, qqtest, qrmdata, qrmtools, rugarch, zoo, ggplot2, lattice, gridExtra, scagnostics, testthat, loon

Enhances

License GPL-2 | GPL-3

NeedsCompilation yes

VignetteBuilder knitr, rmarkdown

adjust_bb

Auxiliary function for adjusting a bounding box

Description

Auxiliary function for adjusting a bounding box

Usage

```
adjust_bb(lastturn, coordslastBB, w, h)
```

Arguments

last turn last turn

coordslastBB coordinates of the last bounding box

w width height

Value

Coordinates of the adjusted bounding box

Author(s)

Wayne Oldford

arrow_1d_graphics

Arrow plot in 1d using R's base graphics

Description

Arrow plot in 1d using R's base graphics

```
arrow_1d_graphics(
  zargs,
  loc = c(0.5, 0.5),
  angle = 60,
  length = 0.6,
  add = FALSE,
  plot... = NULL,
  ...
)
```

arrow_1d_grid 5

Arguments

zargs	argument list as passed from zenplot()
loc	(x,y) -location in $[0,1]^2$; 0 corresponds to left, 1 to right (in the direction of the path)
angle	angle in [0, 180]
length	length of the arrow in [0,1] from tip to base
add	logical indicating whether this plot should be added to the last one
plot	additional arguments passed to plot_region()
	additional arguments passed to segments()

Value

invisible()

Author(s)

Marius Hofert and Wayne Oldford

Arrow plot in 1d using the interactive loon package

Description

Arrow plot in 1d using the interactive loon package

Usage

```
arrow_1d_loon(
  zargs,
  loc = c(0.5, 0.5),
  length = 0.6,
  angle = NULL,
  linkingGroup = NULL,
  showLabels = FALSE,
  showScales = FALSE,
  showGuides = FALSE,
  baseplot = NULL,
  parent = NULL,
  ...
)
```

Arguments

zargs	The argument list as passed from zenplot()
loc	The (x,y) location of the center of the arrow
length	The length of the arrow
angle	The angle from the shaft to the edge of the arrow head
linkingGroup	A string specifying the initial group of plots to be linked to this plot
showLabels	Logical determining whether axis labels are displayed
showScales	Logical determining whether scales are displayed
showGuides	Logical determining whether the background guidelines are displayed
baseplot	If non-null the base plot on which the plot should be layered
parent	The tk parent for this loon plot widget
	Additional parameters passed to loon::l_layer_line()
angle linkingGroup showLabels showScales showGuides baseplot parent	The angle from the shaft to the edge of the arrow head A string specifying the initial group of plots to be linked to this plot Logical determining whether axis labels are displayed Logical determining whether scales are displayed Logical determining whether the background guidelines are displayed If non-null the base plot on which the plot should be layered The tk parent for this loon plot widget

Value

```
A loon loon::l_plot(...)
```

arrow_2d_graphics

Arrow plot in 2d using R's base graphics

Description

Arrow plot in 2d using R's base graphics

Usage

```
arrow_2d_graphics(
  zargs,
  loc = c(0.5, 0.5),
  angle = 60,
  length = 0.2,
  add = FALSE,
  group... = NULL,
  plot... = NULL,
  ...
)
```

Arguments

```
argument list as passed from zenplot()

loc (x,y)-location (in (0,1)^2) of the center of the arrow

angle angle from the shaft to the edge of the arrow head

length length of the arrow in [0,1] from tip to base

add logical indicating whether this plot should be added to the last one

group... list of arguments passed to group_2d_graphics (or NULL)

plot... additional arguments passed to plot_region()

additional arguments passed to points()
```

arrow_2d_grid 9

Value

invisible()

arrow_2d_loon

Arrow plot in 2d using the interactive loon package

Description

Arrow plot in 2d using the interactive loon package

```
arrow_2d_loon(
  zargs,
  loc = rep(0.5, 2),
  length = 0.2,
  angle = 30,
  linkingGroup = NULL,
  color = NULL,
  showLabels = FALSE,
  showScales = FALSE,
  showGuides = FALSE,
  baseplot = NULL,
  parent = NULL,
  group... = NULL,
  ...
)
```

as_numeric 11

Arguments

zargs The argument list as passed from zenplot() loc The (x,y) location of the center of the arrow

length The length of the arrow

angle The angle from the shaft to the edge of the arrow head

linkingGroup The initial linking group

color The color

showLabels Logical determining whether axis labels are displayed showScales Logical determining whether scales are displayed

showGuides Logical determining whether the background guidelines are displayed

baseplot If non-null the base plot on which the plot should be layered

parent The tk parent for this loon plot widget

group... A list of arguments passed to group_2d_loon (or NULL)
... Additional parameters passed to loon::l_layer_line()

Value

the plot (invisibly)

Author(s)

Marius Hofert and Wayne Oldford

```

as_numeric A list of columns

qq_2d_graphics(), qq_2d_grid(), rect_2d_graphics(), rect_2d_grid(), rect_2d_loon()

Description

A list of columns

Usage

as_numeric(x)

12 axes_2d_graphics

Arguments

Х

A list of columns

Value

A list where each column is converted to data (range() works, can be plotted, etc.)

Note

See plot.default -> xy.coords()

Author(s)

Marius Hofert

axes_2d_graphics

Axes arrows in 2d using R's base graphics

Description

Axes arrows in 2d using R's base graphics

Usage

```
axes_2d_graphics(
  zargs,
  length = 0.1,
  eps = 0.04,
  code = 2,
  xpd = NA,
  add = FALSE,
  group... = NULL,
  plot... = NULL,
  ...
)
```

Arguments

zargs	argument list as passed from zenplot()
length	length of the arrow head
eps	distance by which the axes are moved away from the plot region
code	integer code determining the kind of arrows to be drawn; see ?arrows
xpd	logical or NA, determining the region with respect to which clipping takes place; see $?par$
add	logical indicating whether this plot should be added to the last one

axes_2d_grid

```
group... list of arguments passed to group_2d_graphics (or NULL)
plot... additional arguments passed to plot_region()
... additional arguments passed to points()
```

Value

invisible()

boxplot_1d_graphics

Box plot in 1d using R's base graphics

Description

Box plot in 1d using R's base graphics

Usage

```
boxplot_1d_graphics(
  zargs,
  cex = 0.4,
  range = NULL,
  axes = FALSE,
  add = FALSE,
  ...
)
```

Arguments

zargs	The argument list as passed from zenplot()
cex	The character expansion factor
range	A numerical value which determines how far the plot whiskers extend. If NULL, the whiskers (range) grows with sample size.
axes	A logicial indicating whether axes should be drawn
add	A logical indicating whether this plot should be added to the last one
	Additional arguments passed to boxplot()

Value

invisible()

  showScales = FALSE,
  showGuides = FALSE,
  linkingGroup = NULL,
  baseplot = NULL,
  parent,
  ...
)
```

boxplot_1d_loon 19

Arguments

zargs The argument list as passed from zenplot()

color colour for boxplot

linecolor Colour used for the lines to draw the boxplot

1wd The parameter line width for whiskers and median and box boundaries

range numerical value used to determine how far the plot whiskers extend. If NULL,

the whiskers (range) grows with sample size.

showLabels Logical determining whether axis labels are displayed

showScales Logical determining whether scales are displayed

showGuides Logical determining whether the background guidelines are displayed

linkingGroup A string specifying the initial group of plots to be linked to this plot

baseplot If non-null the base plot on which the plot should be layered

parent The tk parent for this loon plot widget
... Additional parameters passed to gpar()

Value

A loon loon::l_plot(...)

20 burst

burst

Splitting an Input Object into a List of Columns

Description

Splits a (numeric/logical/character) vector, matrix, data.frame or a list of such into a list of columns, with corresponding group and variable information as well as labels. This is an auxiliary function for checking and converting the data argument of zenplot().

Usage

```
burst(x, labs = list())
```

Arguments

Х

A numeric vector, matrix, data.frame or, for burst(), a list of such.

labs

Either NULL (in which case neither group nor variable labels are used or computed) or a list with components

group - the group label basename or labels for the groups (or NULL for no group labels)

var - the variable label basename or labels for the variables (or NULL for no variable labels)

sep - the string used as the separator between group and variable labels

group2d - a logical indicating whether labels of group_2d_*() plots are affected by group = NULL (or printed anyway)

If any of these components is not given, it is set to the defaults as described in zenplot(). Note that if at least one (group or variable) label is given in x, then those (original) labels will be used. If labs = NULL, neither group nor variable labels are used.

Value

```
A list with components xcols - a list containing the column vectors of x
```

groups - the group number for each column of x

vars - the variable number (within each group) for each column of x

glabs - the group label for each column of x

labs - the group and variable labels for each column of x

Note

Performance critical

Author(s)

Marius Hofert

burst_aux 21

See Also

Other tools for constructing your own plot1d and plot2d functions: burst_aux(), check_zargs(), extract_1d(), extract_2d(), plot_indices()

Examples

```
## Unnamed list of (some named, some unnamed) valid components
A \leftarrow matrix(1:12, ncol = 3)
x <- list(A, 1:4, as.data.frame(A))
burst(x, labs = list(group = "G", var = "V", sep = ", "))
burst(x) # the same defaults as above
burst(x, labs = list(sep = " ")) # only changing the separator
## Note: - No group labels are given in 'x' and thus they are constructed
          in the above call
##
          - The variable names are only constructed if not given
burst(x, labs = list(group = ""))
burst(x, labs = list(group = NULL, group2d = TRUE)) # no group labels
## Note: There's no effect of 'group2d = TRUE' visible here as
          'x' doesn't contain group labels
burst(x, labs = list(group = NULL)) # no group labels unless groups change
burst(x, labs = list(var = NULL)) # no variable labels
burst(x, labs = list(group = NULL, var = NULL)) # neither one
burst(x, labs = NULL) # similarly, without any labels at all
## Named list
x \leftarrow list(mat = A, vec = 1:4, df = as.data.frame(A))
burst(x)
## Note: - The given group labels are used
          - The variable names are only constructed if not given
burst(x, labs = list(group = NULL, group2d = TRUE)) # no group labels
burst(x, labs = list(group = NULL)) # no group labels unless groups change
## Note: Now the effect of 'group2d' is visible.
## Partially named list
x \leftarrow list(mat = A, vec = 1:4, as.data.frame(A))
burst(x)
burst(x, labs = list(group = NULL, group2d = TRUE)) # no group labels
burst(x, labs = list(group = NULL)) # no group labels unless groups change
burst(x, labs = list(var = NULL)) # no variable labels
burst(x, labs = list(group = NULL, var = NULL)) # only group labels and only if groups change
burst(x, labs = NULL) # neither group nor variable labels
```

22 check_zargs

Description

Auxiliary function for burst()

Usage

```
burst_aux(x, labs = "V")
```

Arguments

A vector, matrix or data.frame (or a (pure) list, but that we don't use here)

labs

The variable labels: - if NULL, no labels are used - if of length 1, use this label and append 1:ncol(x) but only if x doesn't have any column names (otherwise use the latter) - if of length ncol(x), use that but only if x doesn't have any

column names (otherwise use the latter)

Value

'x' as a list of named columns

Note

- Performance critical (no checks here) - Data frames always have default names. They are possibly ugly but we have to use them here as we cannot determine whether they were assigned automatically or on purpose.

Marius Hofert

See Also

Other tools for constructing your own plot1d and plot2d functions: burst(), check_zargs(), extract_1d(), extract_2d(), plot_indices()

check_zargs

Checking whether certain arguments appear in zargs

Description

Checking whether certain arguments appear in zargs

```
check_zargs(zargs, ...)
```

23 connect_pairs

Arguments

The argument list as passed from zenplot() zargs

The arguments to be checked for presence in zargs . . .

Value

A logical indicating whether some arguments are missing in zargs

Author(s)

Marius Hofert

See Also

Other tools for constructing your own plot1d and plot2d functions: burst_aux(), burst(), extract_1d(), extract_2d(), plot_indices()

connect_pairs

Connecting Possibly Overlapping Pairs Into a List of Paths

Description

Pairs, given as rows of a matrix, data. frame, or list, are processed to return a list of paths, each identifying the connected pairs in the rows of x.

Usage

```
connect_pairs(x, duplicate.rm = FALSE)
```

Arguments

two-column matrix, data.frame, or a list containing vectors of length two Х representing the pairs to be connected.

duplicate.rm logical indicating whether equal pairs (up to permutation) are to be omitted.

Value

A list each of whose elements give a path of connected pairs. Each list element is a vector of length at least 2 (longer vectors > 2 in length identify the pairs connected in a path).

Author(s)

Marius Hofert and Wayne Oldford

24 convert_occupancy

```
zenplot() which provides the zenplot.
Other tools related to constructing zenpaths: extract_pairs(), graph_pairs(), groupData(), indexData(), zenpath()
```

Examples

```
## First something simple.
(pairs <- matrix(c(1,2,2,3,3,5,5,7,8,9), ncol = 2, byrow = TRUE))
## Connect pairs into separate paths defined by the row order.
connect_pairs(pairs)
## Now something different
nVars <- 5
pairs <- expand.grid(1:nVars, 1:nVars)</pre>
## and take those where
(pairs <- pairs[pairs[,1] < pairs[,2],])</pre>
connect_pairs(pairs)
## Something more complicated.
## Get weights
set.seed(27135)
x <- runif(choose(nVars,2)) # weights</pre>
## We imagine pairs identify edges of a graph with these weights
## Get a zenpath ordering the edges based on weights
(zp <- zenpath(x, pairs = pairs, method = "strictly.weighted"))</pre>
## And connect these giving the list of paths
connect_pairs(zp)
```

convert_occupancy

Converting an Occupancy Matrix

Description

Convert an occupancy matrix to matrix with different symbols.

Usage

```
convert_occupancy(x, to = c("", "<", ">", "v", "^"))
```

Arguments

```
x an occupancy matrix consisting of the character "" (unoccupied), "1" (left), "r" (right), "d" (down) or "u" (up) as returned by zenplot().

to a vector of symbols to which "", "1", "r", "d" and "u" should be mapped.
```

density_1d_graphics 25

Value

matrix as the occupancy matrix but with entries replaced by those in to.

Examples

```
## Generate some data
n <- 1000 # sample size
d <- 20 # dimension
set.seed(271) # set seed (for reproducibility)
x <- matrix(rnorm(n * d), ncol = d) # i.i.d. N(0,1) data
## Extract the occupancy matrix from a zenplot
res <- zenplot(x)
(occ <- res[["path"]][["occupancy"]])
## Convert the occupancy matrix
convert_occupancy(occ)</pre>
```

density_1d_graphics

Density plot in 1d using R's base graphics

Description

Density plot in 1d using R's base graphics

```
density_1d_graphics(
  zargs,
  density... = NULL,
  offset = 0.08,
  add = FALSE,
  plot... = NULL,
  ...
)
```

26 density_1d_grid

Arguments

zargs argument list as passed from zenplot()

density... list of arguments for density()

offset number in [0, 0.5] determining how far away the density stays from the plot

margins (for creating space between the two)

add logical indicating whether this plot should be added to the last one

plot... additional arguments passed to plot_region()
... additional arguments passed to polygon()

Value

fill = NULL,
linecolor = NULL,
linkingGroup = NULL,
showLabels = FALSE,
showScales = FALSE,
showGuides = FALSE,
baseplot = NULL,
parent = NULL,
...
)
```

Arguments

zargs The argument list as passed from zenplot()

density.args A list of arguments for density()

method A character specifying the type of density used

lwd Line width used only when linewidth = NULL, value of 1 used otherwise.

linewidth Line width of outline for density polygons (highest priority)

color Colour used to fill the density when fill is NULL and to outline the density when

linecolor is NULL, foreground colour used otherwise.

fill Colour used to fill the density polygon linecolor Colour used for the outline of the density

linkingGroup A string specifying the initial group of plots to be linked to this plot

showLabels Logical determining whether axis labels are displayed showScales Logical determining whether scales are displayed

showGuides Logical determining whether the background guidelines are displayed

baseplot If non-null the base plot on which the plot should be layered

parent The tk parent for this loon plot widget

density_2d_grid

Density plot in 2d using the grid package

Description

Density plot in 2d using the grid package

Usage

```
density_2d_grid(
  zargs,
  ngrids = 25,
  ccol = NULL,
  clwd = 1,
  clty = 1,
  box = FALSE,
  box.width = 1,
  group... = list(cex = 0.66),
  draw = FALSE,
  ...
)
```

Arguments

zargs	argument list as passed from zenplot()
ngrids	number of grid points in each direction. Can be scalar or a length-2 integer vector.
ccol	vector (which is then recycled to the appropriate length) giving the color of the contours
clwd	vector (which is then recycled to the appropriate length) giving the line widths of the contours

density_2d_loon 31

clty vector (which is then recycled to the appropriate length) giving the line types of

the contours

box logical indicating whether a box should be drawn

box.width width of the box box.height height of the box

group... list of arguments passed to group_2d_grid (or NULL)

draw logical indicating whether drawing should take place

... additional arguments passed to gpar()

Value

grob (invisibly)

Note

- We use names depending on the 'type' here since otherwise, if one calls it once for 'p' and once for 'l', only one of them is plotted - The default point size was chosen to match the default of graphics

de_elect

German Election Data from 2002 and 2005

Description

Data set consisting of 68 columns of data about the German elections 2002 and 2005.

Usage

```
data("de_elect")
```

Format

```
A data.frame() with 68 columns:
District: electoral district
State: federal state (Bundesland)
Num.comm: number of communities
Area: area 2004-12-31 (in square km)
Pop: population 2004-12-31 (in 1000)
Men: men (in 1000)
Citizens: germans (in 1000)
Density: population density 2004-12-31 (in square km)
Pop.le.15: population younger than (or equal to) 15 years 2002-12-31 (in percent)
Pop. 15.18: population between 15 and 18 years old 2002-12-31 (in percent)
Pop. 18. 25: population between 18 and 25 years old 2002-12-31 (in percent)
Pop. 25. 35: population between 25 and 35 years old 2002-12-31 (in percent)
Pop. 35. 60: population between 35 and 60 years old 2002-12-31 (in percent)
Pop.g.60: population older than 60 years 2002-12-31 (in percent)
Births: live births (per 1000)
```

```
data("de_elect")
```

extract_1d

Extracting information for our default/provided plot1d()

Description

Extracting information for our default/provided plot1d()

Usage

```
extract_1d(zargs)
```

Arguments

zargs

The argument list as passed from zenplot(). This must at least contain x, orientations, vars, num, lim and labs; see zenplot() for an explanation of these variables.

36 extract_1d

Details

This is an auxiliary function called on zargs within any 1d plotting function (e.g. hist_1d_grid, density_1d_graphics, or points_1d_loon) to extract the 1d data from zargs needed for plotting. For performance reasons, no checking of the input object is done.

Value

```
A list list with

x: the data to be plotted in the 1d plot

xcols: a list with all columns of x

groups: the group numbers for each column of x

vars: the variable numbers for each column of x

glabs: the group labels for each column of x

vlabs: the variable labels for each column of x

horizontal: a logical indicating whether the plot is horizontal or vertical, and

xlim: the axis limits.

```

extract_2d

Extracting information for our default/provided plot2d()

Description

Extracting information for our default/provided plot2d()

Usage

```
extract_2d(zargs)
```

Arguments

zargs

The argument list as passed from <code>zenplot()</code>. This must at least contain x, vars, num, lim and labs (for <code>extract_2d())</code>; see <code>zenplot()</code> for an explanation of these variables.

38 extract_2d

Details

This is an auxiliary function called on zargs within any 1d plotting function (e.g. hist_1d_grid, density_1d_graphics, or points_1d_loon) to extract the 1d data from zargs needed for plotting. For performance reasons, no checking of the input object is done.

Value

```
A list list with

x and y: the data to be plotted in the 2d plot

xcols: a list with all columns of x

groups: the group numbers for each column of x

vars: the variable numbers for each column of x

glabs: the group labels for each column of x

vlabs: the variable labels for each column of x

xlim and ylim: the x-axis and y-axis limits, and

same.group: a logical indicating whether the x and y variables belong to the same group.
```

Note

Performance critical

                }
## And now try it out
zenplot(iris, plot2d = my_2d_plot)
```

extract_pairs

Extract Pairs from a Path of Indices

Description

Extracts pairs from a path of indices, representing the path by the pairs (connected by common variable) and return a shortened path.

Usage

```
extract_pairs(x, n)
```

Arguments

n

x the path, a vector or list of indices of the variables to be plotted.

A vector of length two giving the number of pairs to extract from the path x (if NULL, all pairs are returned (nothing extracted); if of length one, it is replicated in the pair). The first number corresponds to the beginning of the path, the second to the end; at least one of the two numbers should be >= 1.

Value

returns an object of the same type as the input x but (possibly) shortened. It extracts the first/last so-many pairs of x.

40 get_layout

Author(s)

Marius Hofert and Wayne Oldford

See Also

```
zenplot() which provides the zenplot.
Other tools related to constructing zenpaths: connect_pairs(), graph_pairs(), groupData(), indexData(), zenpath()
```

Examples

```
## Begin with a path
(zp <- zenpath(c(3, 5), method = "eulerian.cross")) # integer(2) argument
## Extract the first two pairs and last four of indices
extract_pairs(zp, n = c(2, 4))
## Extract the first and last three pairs of indices
extract_pairs(zp, n = 3) # the 3 is repeated automatically</pre>
```

get_layout

Compute the layout of the zen plot

Description

Compute the layout of the zen plot

Usage

```
get_layout(
  turns,
  n2dplots,
  first1d = TRUE,
  last1d = TRUE,
  width1d = 1,
  width2d = 10
)
```

Arguments

turns	turns (character vector consisting if "u", "d", "l", "r")
n2dplots	the number of 2d plots (faces of the hypercube to be laid out)
first1d	logical indicating whether the first 1d plot should be plotted
last1d	logical indicating whether the last 1d plot should be plotted
width1d	width of 1d plots
width2d	width of 2d plots

get_path 41

Value

list containing 1) the plot orientations (c("h", "s", "v", "s", ...)) 2) the plot dimensions (1d plot, 2d plot, 1d plot, ...) 3) the variable numbers plotted (an (nPlots, 2)-matrix) 4) the total width of the layout 5) the total height of the layout 6) coordinates of the bounding boxes

Author(s)

Marius Hofert and Wayne Oldford

get_path

Computing the path according to the provided method

Description

Computing the path according to the provided method

Usage

```
get_path(
  turns = NULL,
  n2dcols = c("letter", "square", "A4", "golden", "legal"),
  n2dplots,
  method = c("tidy", "double.zigzag", "single.zigzag", "rectangular"),
  first1d = TRUE,
  last1d = TRUE
)
```

Arguments

turns	The turns
n2dcols	The number of columns of 2d plots ($>=1$) or one of "letter", "square", "A4", "golden", "legal". Note that n2dcols is ignored if turns is not NULL.
n2dplots	The number of 2d plots to be laid out
method	A character string indicating the method according to which the path is built
first1d	A logical indicating whether the first 1d plot should be plotted
last1d	A logical indicating whether the last 1d plot should be plotted

Value

the path, a list containing the turns, the positions (indices in the occupancy matrix) and the the occupancy matrix

Author(s)

Marius Hofert and Wayne Oldford

42 graph_pairs

get_zigzag_turns

Compute turns for zigzag

Description

Compute turns for zigzag

Usage

```
get_zigzag_turns(
  nPlots,
  n2dcols,
  method = c("tidy", "double.zigzag", "single.zigzag")
)
```

Arguments

nPlots total number of plots

n2dcols number of columns of 2d plots (>= 1)

method character string indicating which zigzag method to use

Value

turns

Author(s)

Marius Hofert and Wayne Oldford

graph_pairs

Turn pairs or paths into a graph

Description

Pairs are processed to produce a graph with the elements of the pairs as vertices and the pairs as undirected edges. The result can be displayed using plot().

```
graph_pairs(x, var.names = NULL, edgemode = c("undirected", "directed"))
```

graph_pairs 43

Arguments

x matrix or list of pairs along a zenpath. Can also be a list containing vectors representing paths in the graph. Every path must be of length at least 2 (i.e. each vector element of the list).

var.names names of the variables appearing in x.

edgemode type of edges to be used: either "undirected" (the default) or "directed" (in

which case the order of the nodes in each pair matters).

Value

```
a graphNEL object; can be displayed using plot().
```

Note

zenplot() never use directed graphs nor graphs with isolated (disconnected) nodes.

Author(s)

Marius Hofert and Wayne Oldford

See Also

```
zenplot() which provides the zenplot.
Other tools related to constructing zenpaths: connect_pairs(), extract_pairs(), groupData(), indexData(), zenpath()
```

Examples

```
## To display the graphs constructed the packages
## graph and Rgraphviz packages need to be loaded
library(graph)
library(Rgraphviz)
##
## Get some pairs
pairs <- matrix(c(1,2, 5,1, 3,4, 2,3, 4,2), ncol = 2, byrow = TRUE)
g <- graph_pairs(pairs)</pre>
## which can be displayed using plot(g)
plot(g)
## Build a graph from a list of paths
paths <- list(3:1, c(3,5,7), c(1,4,7), c(6,7))
gp <- graph_pairs(paths)</pre>
## graph package draws with grid, so clear
grid.newpage()
plot(gp)
## Nodes do not need to be numbers
alpha_paths <- list(letters[3:1], letters[c(3,5,7)],</pre>
                    letters[c(1,4,7)], letters[c(6,7)])
grid.newpage()
```

44 groupData

groupData

Splitting a Matrix into a List of Matrices

Description

Takes a matrix x and groups its rows (or columns) as specified by indices. Returns a list of matrices, one for each group.

Usage

```
groupData(x, indices, byrow = FALSE)
```

Arguments

x A matrix (or an object convertible to such via as.matrix()).

indices list of vectors of indices according to which x is grouped; each vector of indices

define a group.

byrow logical indicating whether the grouping is done by row (byrow = TRUE) or by

column (byrow = FALSE, the default).

Value

A list of matrices (one per group). Such a list, grouped by columns, is then typically passed on to zenplot().

Author(s)

Marius Hofert and Wayne Oldford

See Also

```
zenplot() which provides the zenplot.
```

Other tools related to constructing zenpaths: connect_pairs(), extract_pairs(), graph_pairs(), indexData(), zenpath()

group_2d_graphics 45

Examples

```
## get a matrix
x <- matrix(1:15, ncol = 3)
colGroups <- list(c(1,2), list(2:3))
rowGroups <- list(c(1,4), list(2:3))
groupData(x, indices = colGroups)
groupData(x, indices = rowGroups, byrow = TRUE)</pre>
```

group_2d_graphics

Plot of labels indicating adjacent groups using R's base graphics

Description

Plot of labels indicating adjacent groups using R's base graphics

Usage

```
group_2d_graphics(
  zargs,
  glabs = NULL,
  sep = "\n",
  loc = c(0.5, 0.5),
  add = FALSE,
  plot... = NULL,
  ...
)
```

Arguments

zargs	argument list as passed from zenplot()
glabs	group labels being indexed by the plot variables (and thus of length as the number of variables); if NULL then they are determined with $extract_2d()$
sep	group label separator
loc	(x,y) -location in $[0,1]^2$; 0 corresponds to left, 1 to right (in the direction of the path)
add	logical indicating whether this plot should be added to the last one
plot	additional arguments passed to plot_region()
	additional arguments passed to text()

Value

invisible()

group_2d_grid

Note

For performance reasons (avoiding having to call extract_2d() twice), 'glabs' is an extra argument

hanningee	
happiness	

World Happiness Data Set

Description

Data set consisting of 498 rows and 12 columns containing data from the World Happiness Report over three years.

```
data("happiness")
```

happiness 49

Format

```
data.frame() with 12 columns:
```

Time: year of the World Happiness Report.

Region: region of the world.

Country: country.

Happiness: happiness score measured in the respective year (see Time) by asking "How would you rate your happiness on a scale of 0 to 10 where 10 is happiest?".

Rank: rank of the country based on Happiness.

GDP: extent to which the gross domestic product per capita contributed to the calculation of Happiness.

Family: extent to which family contributed to the calculation of Happiness.

Health: extent to which life expectancy contributed to the calculation of Happiness.

Freedom: extent to which freedom contributed to the calculation of Happiness.

Corruption: extent to which the perception of corruption contributed to the calculation of Happiness.

Generosity: extent to which generosity contributed to the calculation of Happiness.

Dystopia: extent to which the dystopia residual contributed to the calculation of Happiness. Dystopia is an imaginary country with the world's least-happy people (which can act as a benchmark against which all countries can be favorably compared).

Details

GDP, Family, Health, Freedom, Corruption and Generosity describe the extent to which these factors contribute in evaluating the happiness in each country. If added together with Dystopia, one receives the happiness score.

Source

The data set was obtained from https://www.kaggle.com/unsdsn/world-happiness on 2018-04-20 in three different .csv files (one for each year). Joint columns (variables) where then built, the rows expanded (to be the same for each year) and sorted according to Region and Country. Finally, Time was added to obtain a single data set.

indexData

Indexing a Matrix or Data Frame According to Given Indices

Description

Indexing a Matrix or Data Frame According to Given Indices

```
indexData(x, indices)
```

54 is.standard

Arguments

```
x A matrix or data. frame (most useful for the latter).
indices vector of column indices of x (typically obtained from zenpath()).
```

Value

An object as x (typically a data.frame or matrix) containing x indexed by indices.

Note

Useful for constructing data.frames without .1, .2, ... in their names when indexing a data.frame with a zenpath.

Author(s)

Marius Hofert and Wayne Oldford

See Also

```
zenplot() which provides the zenplot.
Other tools related to constructing zenpaths: connect_pairs(), extract_pairs(), graph_pairs(),
groupData(), zenpath()
```

Examples

```
## The function is handiest for data frames
## where we want to reuse the variable names
## without adding a suffix like ".1" etc.
## For example,
x <- BOD # Biochemical Oxygen Demand data in base R
indices <- rep(1:2, 2)
## now compare
indexData(x, indices)
## to
x[, indices]
## zenplots prefer not to have the suffixes.</pre>
```

is.standard

Check Argument for Being a Vector, Matrix, Data Frame or a List of such

Description

Check Argument for Being a Vector, Matrix, Data Frame or a List of such

```
is.standard(x)
```

jitter_1d_graphics 55

Arguments

Χ

A vector, matrix, data.frame or list of such

Value

A logical indicating whether x is of the above type

Author(s)

Marius Hofert

See Also

Other zenplot technical tools: convert_occupancy(), n2dcols_aux(), num_cols(), turn_checker()

jitter_1d_graphics

Jittered dot plot in 1d using R's base graphics

Description

Jittered dot plot in 1d using R's base graphics

Usage

```
jitter_1d_graphics(
  zargs,
  loc = 0.5,
  offset = 0.25,
  cex = 0.4,
  add = FALSE,
  plot... = NULL,
  ...
)
```

Arguments

```
argument list as passed from zenplot()

loc location in [0,1]; 0 corresponds to left, 1 to right (in the direction of the path)

offset number in [0,0.5] determining how far off the center the jittered points reach maximally

cex character expansion factor

add logical indicating whether this plot should be added to the last one

plot... additional arguments passed to plot_region()

... additional arguments passed to points()
```

56 jitter_1d_grid

Value

invisible()

jitter_1d_grid

Jittered dot plot in 1d using the grid package

Description

Jittered dot plot in 1d using the grid package

Usage

```
jitter_1d_grid(
  zargs,
  loc = 0.5,
  offset = 0.25,
  pch = 21,
  size = 0.02,
  draw = FALSE,
  ...
)
```

Arguments

```
zargs argument list as passed from zenplot()

loc location in [0,1]; 0 corresponds to left, 1 to right (in the direction of the path)

offset number in [0,0.5] determining how far off the center the jittered points reach maximally

pch plotting symbol
```

jitter_1d_loon 57

```
size size of the plotting symbol
draw logical indicating whether drawing should take place
... additional arguments passed to gpar()
```

Value

```
grob (invisibly)
```

Note

The default point size was chosen to match the default of graphics

jitter_1d_loon

Jittered dot plot in 1d using the interactive loon package

Description

Jittered dot plot in 1d using the interactive loon package

```
jitter_1d_loon(
  zargs,
  linkingGroup = NULL,
  showLabels = FALSE,
  showScales = FALSE,
  showGuides = FALSE,
  glyph = "ocircle",
  itemLabel = NULL,
  showItemLabels = TRUE,
```

58 jitter_1d_loon

```
parent = NULL,
    ...
)
```

Arguments

zargs The argument list as passed from zenplot()

linkingGroup A string specifying the initial group of plots to be linked to this plot

showLabels Logical determining whether axis labels are displayed

showScales Logical determining whether scales are displayed

showGuides Logical determining whether the background guidelines are displayed

glyph Glyph to be used for points, default is the open circle: "ocircle"

itemLabel A vector of strings to serve as the item labels

showItemLabels Logical determing whether item labels display on mouse hover

parent The tk parent for this loon plot widget

... Additional parameters passed to loon::l_plot()

Value

```
A loon loon::l_plot(...)
```

Author(s)

Marius Hofert and Wayne Oldford

  linkingGroup = NULL,
  showLabels = FALSE,
  showScales = FALSE,
  showGuides = FALSE,
  baseplot = NULL,
  parent = NULL,
)
```

label_1d_loon

Arguments

zargs	The argument list as passed from zenplot()
loc.x	x-location of the label
loc.y	y-location of the label
label	The label to be used
rot	The rotation of the label
size	The font size
box	A logical indicating whether the label is to be enclosed in a box.
color	Color of the label (and of box when box = TRUE).
linkingGroup	A string specifying the initial group of plots to be linked to this plot
showLabels	Logical determining whether axis labels are displayed
showScales	Logical determining whether scales are displayed
showGuides	Logical determining whether the background guidelines are displayed
baseplot	If non-null the base plot on which the plot should be layered
parent	The tk parent for this loon plot widget
	Additional parameters passed to loon::l_layer_text()

Value

A loon::l_plot(...)

```

lines_1d_loon 73

```
linkingGroup = NULL,
showLabels = FALSE,
showScales = FALSE,
showGuides = FALSE,
baseplot = NULL,
parent = NULL,
...
)
```

Arguments

zargs The argument list as passed from zenplot()

loc.x x-coordinates of the points on the line

loc.y y-coordinates of the pointson the line

color Colour of the line

lwd line width

linkingGroup A string specifying the initial group of plots to be link

linkingGroup A string specifying the initial group of plots to be linked to this plot (ignored)

showLabels Logical determining whether axis labels are displayed showScales Logical determining whether scales are displayed

showGuides Logical determining whether the background guidelines are displayed

baseplot If non-null the base plot on which the plot should be layered

parent The tk parent for this loon plot widget

... Additional parameters passed to loon::l_layer_text(...)

Value

A loon loon::l_plot(...)

Author(s)

Marius Hofert and Wayne Oldford

```
Other default 1d plot functions using the interactive loon package: arrow_1d_loon(), boxplot_1d_loon(), density_1d_loon(), hist_1d_loon(), jitter_1d_loon(), label_1d_loon(), points_1d_loon(), rect_1d_loon(), rug_1d_loon()

```

74 l_ispace_config

l_ispace_config

Configuring a loon plot to accommodate ispace

Description

Configuring a loon plot to accommodate ispace

Usage

```
l_ispace_config(
  baseplot,
  ispace = NULL,
  x = NULL,
  y = NULL,
  xlim = NULL,
  ylim = NULL,
  ...
)
```

Arguments

baseplot	The plot to be modified
ispace	The inner space (in [0,1])
x	The x data
у	The y data
xlim	The x-axis limits; if NULL, the data limits are used
ylim	The y-axis limits; if NULL, the data limits are used
	Additional arguments passed to loon::l_configure

Value

The baseplot

Author(s)

R. W. Oldford

```
Other graphical tools: na_omit_loon(), plot_region(), vport(), zenarrow()
```

move 75

move	Determine the new position when moving from the current position in
	a given direction

Description

Determine the new position when moving from the current position in a given direction

Usage

```
move(curpos, dir, method = c("in.occupancy", "in.plane"))
```

Arguments

curpos current position (i, j) in the occupancy matrix dir direction in which we move ("d", "u", "r" or "l")

method choice of method ("in.occupancy" means the (current/new) position is given in

terms of (row, column) indices in the occupancy matrix; "in.plane" means the

directions are interpreted as in the (x,y)-plane).

Value

new position in the occupancy matrix

Author(s)

Marius Hofert and Wayne Oldford

n2dcols_aux

Auxiliary Function for Constructing Default n2dcols

Description

Auxiliary Function for Constructing Default n2dcols

Usage

```
n2dcols_aux(n2dplots, method = c("letter", "square", "A4", "golden", "legal"))
```

Arguments

n2dplots The number of variates (= nfaces)

method One of "letter", "square", "A4", "golden", "legal"

76 na_omit_loon

Value

An odd integer for n2dcols

Author(s)

Wayne Oldford

See Also

Other zenplot technical tools: convert_occupancy(), is.standard(), num_cols(), turn_checker()

na_omit_loon

Helper function to remove NAs for loon plots

Description

Helper function to remove NAs for loon plots

Usage

```
na_omit_loon(x, y = NULL, linkingKey = NULL, itemLabel = NULL)
```

Arguments

x The vector of x values (required)

y The vector of y values (optional) of the same length as x; if NULL then it's

ignored.

linkingKey The vector of keys used to define links between points, of the same length as x;

if NULL it will be 0:(length(x)-1).

itemLabel The vector of labels for the points, of the same length as x; if NULL it will be

constructed.

Value

A list(x, y, linkingKey, itemLabel) where any NA in x or y will have been omitted from all

Author(s)

R. W. Oldford

```
Other graphical tools: l_ispace_config(), plot_region(), vport(), zenarrow()
```

next_move_tidy 77

next_move_tidy

Determine the next position to move to and the turn out of there

Description

Determine the next position to move to and the turn out of there

Usage

```
next_move_tidy(plotNo, nPlots, curpath)
```

Arguments

plotNo current plot number
nPlots total number of plots
curpath the current path

Value

a list containing the next position to move to (nextpos) and the turn out of there (nextout); Interpretation: nextpos: position of plot number plotNo+1 in the (non-trimmed) occupancy matrix nextout: turn out of nextpos

Note

- This assumes that the last plot is a 1d plot! - It also assumes that first1d = TRUE; will be adapted later in get_path() in case first1d = FALSE. - We start in (1, 2) and also have an additional last column in the occupancy matrix to have the first and last column left in case we end up there with the last 1d plot; this cannot happen for 'zigzag' but for 'tidy'.

Author(s)

Marius Hofert and Wayne Oldford

num_cols

Determine the number of columns if is.standard(x)

Description

Determine the number of columns if is.standard(x)

```
num_cols(x)
```

78 olive

Arguments

Х

A numeric vector, matrix, data.frame or a list of such.

Value

The number of data columns of 'x'

Author(s)

Marius Hofert

See Also

Other zenplot technical tools: convert_occupancy(), is.standard(), n2dcols_aux(), turn_checker()

olive

Olive Oil Data Set

Description

Data set consisting of 572 rows and 10 columns containing data about olive oil.

Usage

```
data("olive")
```

Format

```
A data.frame() with 10 columns:
```

```
Area: (larger) area.

Region: (local) region.
```

palmitic, palmitoleic, stearic, oleic, linoleic, linolenic, arachidic, eicosenoic: the fatty acids measured.

Source

The data set was obtained from the package **pdfCluster** (for convenience). It contains 572 rows of observations. The first and the second column correspond to the area (Centre-North, South, Sardinia) and the geographical region of origin of the olive oils (northern Apulia, southern Apulia, Calabria, Sicily, inland Sardinia and coast Sardinia, eastern and western Liguria, Umbria), respectively. The remaining columns represent the chemical measurements (on the acid components for the oil specimens) palmitic, palmitoleic, stearic, oleic, linoleic, linolenic, arachidic, eicosenoic.

Examples

```
data("olive")
```

plot_exists 79

plot_exists

Check whether functions (plot*d to zenplot()) exist

Description

Check whether functions (plot*d to zenplot()) exist

Usage

```
plot_exists(x)
```

Arguments

Х

arguments plot1d or plot2d of zenplot()

Value

logical indicating whether x exists

Note

Check first whether it's a function (have to rely on it being able to be evaluated, cannot do more checks then) or, if a string, whether it exists

Author(s)

Marius Hofert

plot_indices

Plot Indices of the Current Plot

Description

Determining the indices of the x and y variables of the current plot

Usage

```
plot_indices(zargs)
```

Arguments

zargs

argument list as passed from zenplot(). This must at least contain vars and num; see zenplot() for an explanation of these variables.

80 plot_region

Details

This is an auxiliary function useful, for example, when writing user-provided 1d and 2d plot func-

Value

A numeric(2) containing the indices of the x and y variables to be plotted in the current plot (the plot with number num). If the current plot is a 2d plot, the same variable is used twice.

Note

This is exported so that one doesn't always have to figure out whether the variables (axes) in the current plot need to be switched manually.

Author(s)

Marius Hofert

Other tools for constructing your own plot1d and plot2d functions: burst_aux(), burst(), check_zargs(), extract_1d(), extract_2d()

plot_region

Function to set up the plot region for graphics plots

Description

Auxiliary function for setting up the plot region of 1d and 2d graphics plots.

Usage

```
plot_region(xlim, ylim, plot... = NULL)
```

Arguments

xlim x-axis limits ylim y-axis limits

plot... arguments passed to the underlying plot()

Details

This is an auxiliary function used by the provided **graphics**-related 1d and 2d plots.

Value

```
invisible()
```

rect_1d_loon

Rectangle plot in 1d using the interactive loon package

Description

Rectangle plot in 1d using the interactive loon package

Usage

```
rect_1d_loon(
  zargs,
  loc.x = NULL,
  loc.y = NULL,
  color = NULL,
  fill = NULL,
  lwd = 1,
  linkingGroup = NULL,
  showLabels = FALSE,
  showScales = FALSE,
  showGuides = FALSE,
  baseplot = NULL,
  parent = NULL,
  ...
)
```

Arguments

zargs	The argument list as passed from zenplot()
loc.x	x-location of rectangle
loc.y	y-location of rectangle
color	Colour of the rectangle outline
fill	Colour of the rectangle interior
lwd	line width for rectangle outline

94 rect_2d_graphics

linkingGroup	A string specifying the initial group of plots to be linked to this plot (ignored)
showLabels	Logical determining whether axis labels are displayed
showScales	Logical determining whether scales are displayed
showGuides	Logical determining whether the background guidelines are displayed
baseplot	If non-NULL the base plot on which the plot should be layered
parent	The tk parent for this loon plot widget
	Additional parameters passed to loon::l_layer_text()

Value

```
A loon loon::l_plot(...)
```

```

rug_1d_grid

Rug plot in 1d using the grid package

Description

Rug plot in 1d using the grid package

Usage

```
rug_1d_grid(
  zargs,
  loc = 0.5,
  length = 0.5,
  width = 0.001,
  col = par("fg"),
  draw = FALSE,
  ...
)
```

Arguments

```
zargs argument list as passed from zenplot()

loc location in [0,1]; 0 corresponds to left, 1 to right (in the direction of the path)

length length of the rugs

width line width of the rugs

col default color of the rectangles/rugs

draw logical indicating whether drawing should take place

... additional arguments passed to gpar()
```

Value

```
grob (invisibly)
```

Note

The choice of width and height is to leave the rugs enough space to not touch points (so to avoid points and rugs overplotting).

turn_checker

Check the Turns (Number/Type)

Description

Check the Turns (Number/Type)

Usage

```
turn_checker(turns, n2dplots, first1d, last1d)
```

Arguments

turns The turns

n2dplots The number of 2d plots

first1d A logical indicating whether the first 1d plot should be plotted
last1d A logical indicating whether the last 1d plot should be plotted

Value

TRUE (unless it fails)

Author(s)

Marius Hofert

102 unfold

unfold	Unfold the hypercube and produce all information concerning the zen-path and zenplot layout

Description

The unfold() function imagines each pair of variables/dimensions as a "face" of a high dimensional cube. These faces are "unfolded" from one 2d space or "face" to the next about the 1d face or "edge" they share. The unfold() function takes, as first argument, nfaces, the number of 2d plots/spaces to be "unfolded" and produces the zenpath and zenplot layout required for the function zenplot(). Laying out these pairs with a zenplot is what is alluded to as an "unfolding" of (at least a part of) the high dimensional space.

Usage

Arguments

8	
nfaces	The number of faces of the hypercube to unfold
turns	A character vector (of length two times the number of variables to be plotted minus 1) consisting of "d", "u", "r" or "1" indicating the turns out of the current plot position; if NULL, the turns are constructed.
n2dcols	number of columns of 2d plots (≥ 1) or one of "letter", "square", "A4", "golden" or "legal" in which case a similar layout is constructed. Note that n2dcols is ignored if !is.null(turns).
method	The type of zigzag plot (a character). Available are:
	tidy: more tidied-up double.zigzag (slightly more compact placement of plots towards the end).
	double.zigzag: zigzag plot in the form of a flipped "S". Along this path, the plots are placed in the form of an "S" which is rotated counterclockwise by 90 degrees.
	single.zigzag: zigzag plot in the form of a flipped "S".
	rectangular: plots that fill the page from left to right and top to bottom. This is useful (and most compact) for plots that do not share an axis.
	Note that method is ignored if turns are provided.
first1d	A logical indicating whether the first one-dimensional (1d) plot should be plotted.
last1d	A logical indicating whether the last one-dimensional (1d) plot should be plotted
width1d	A graphical parameter > 0 giving the width of 1d plots.
width2d	A graphical parameter > 0 giving the width of 2d plots.

unfold 103

Value

A list describing the unfolded path and its layout as a list of named components:

path: the path of the unfolding, itself given as a structured list having components

turns: the sequence of turns – each being one of "l" (for left), "r" (for right), "d" (for down), and "u" (for up) – required to move from the current plot location in the display to the next along the unfolded path.

positions: the path as a matrix of (x, y) positions giving the indices in the occupancy matrix of each plot in the path.

occupancy: A rectangular array whose cells indicate the positions of the plots on the page.

layout: the details of the visual layout of the plots and given as a structured list having components

orientations: a vector indicating the orientation of each of the displays in order – "h" for horizontal, "v" for vertical, and "s" for square.

dimensions: a vector giving the dimensionality of each plot in order.

vars: A matrix of the variable indices to be used in each plot – x being the horizontal variable and y the vertical.

layoutWidth: A positive integer giving the display width of a 2d plot.

layoutHeight: A positive integer giving the display height of a 2d plot.

boundingBoxes: A matrix of 4 columns giving locations (left, right, bottom, and top) of the box which bound each of the plots in order.

Note

Although unfold() is probably rather rarely used directly by a user, it provides insight into how zenplots are constructed.

104 vport

١,,	n	<u> </u>	_	+
v	L)(.)		L.

Viewport Constructing Function for Grid Functions

Description

Auxiliary function for constructing viewports for 1d and 2d (default) plots.

Usage

```
vport(ispace, xlim = NULL, ylim = NULL, x = NULL, y = NULL, ...)
```

Arguments

ispace	inner space (in $[0,1]$))
xlim	x-axis limits; if NULL, the data limits are used.
ylim	y-axis limits; if NULL, the data limits are used.
Х	x data (only used if is.null(xlim)); if NULL, $0:1$ is used.
у	y data (only used if is.null(ylim)); if NULL, 0:1 is used.
	additional arguments passed to the underlying viewport().

Details

This is an auxiliary function used by the provided **grid**-related 1d and 2d plots.

Value

The viewport.

Note

```
Ideas from dataViewport() and extendrange() Omitted check: if(length(ispace) != 4) ispace <rep(ispace, length.out = 4) stopifnot(0 <= ispace, ispace <= 1)
```

Author(s)

Marius Hofert

wine 105

wine

Wine Data Set

Description

Data set consisting of 178 rows and 27 columns containing data about wine from the Piedmont region of Italy.

Usage

```
data("wine")
```

Format

```
data.frame() with 27 columns:
wine: wine name (categorical variable with levels Barbera, Barolo, Grignolino).
alcohol: alcohol percentage (numeric).
sugar: sugar-free extract (numeric).
acidity: fixed acidity (numeric).
tartaric: tartaric acid (numeric).
malic: malic acid (numeric).
uronic: uronic acids (numeric).
pH: pH (numeric).
ash: ash (numeric).
alcal_ash: alcalinity of ash (numeric).
potassium: potassium (numeric).
calcium: calcium (numeric).
magnesium: magnesium (numeric).
phosphate: phosphate (numeric).
cloride: chloride (numeric).
phenols: total phenols (numeric).
flavanoids: flavanoids (numeric).
nonflavanoids: nonflavanoid phenols (numeric).
proanthocyanins: proanthocyanins (numeric).
colour: colour intensity (numeric).
hue: hue (numeric).
OD_dw: OD_{280}/OD_{315} of diluted wines (numeric).
OD_f1: OD_{280}/OD_{315} of flavanoids (numeric).
glycerol: glycerol (numeric).
butanediol: 2,3-butanediol (numeric).
nitrogen: total nitrogen (numeric).
proline: proline (numeric).
methanol: methanol (numeric).
```

106 zenarrow

Source

The data set was obtained from the R\ package **sn** (for convenience). It represent chemical measurements on each of 178 wine specimens belonging to three types of wine produced in the Piedmont region of Italy. The data set includes all variables listed by Forina *et al.* (1986) with the exception of 'Sulphate'. The first variable is categorial, all others are numeric.

Forina, M., Lanteri, S. Armanino, C., Casolino, C., Casale, M. and Oliveri, P. V-PARVUS 2008: an extendible package of programs for esplorative data analysis, classification and regression analysis. Dip. Chimica e Tecnologie Farmaceutiche ed Alimentari, Università di Genova, Italia. Web-site (not accessible as of 2014): 'http://www.parvus.unige.it'

```

zenarrow

Defining an arrow

Description

Defining an arrow

Usage

```
zenarrow(turn, angle = 80, length = 1, coord.scale = 1)
```

Arguments

turn The direction in which the arrow will point ("l", "r", "d", "u")

angle The angle

length The length of the arrow in [0,1] from tip to base

coord.scale Scale the coordinates of the arrow

Value

A 3-column matrix containing the (x,y) coordinates of the left edge end point, the arrow head and the right edge end point

Author(s)

Marius Hofert

zenpath 107

Other graphical tools: l_ispace_config(), na_omit_loon(), plot_region(), vport()
```

zenpath

Construct a Path of Indices to Order Variables

Description

Constructing zenpaths and tools for extracting, connecting and displaying pairs, as well as grouping and indexing data structures.

Usage

Arguments

"greedy.weighted": numeric weight vector (or matrix or distance matrix).

"strictly.weighted": as for method = "greedy.weighted".

pairs

a two-column matrix containing (row-wise) the pairs of connected variables to be sorted according to the weights. Note that the resulting graph must be connected (i.e. any variable can be reached from any other variable following the connections given by pairs). The pairs argument is only used for the methods greedy.weighted and strictly.weighted and can be NULL (in which case a default is constructed in lexicographical order).

method

character string indicating the sorting method to be used. Available methods are:

"front.loaded": Sort all pairs such that the first variables appear the most frequently early in the sequence; an Eulerian path; note that it might be slightly longer than the number of pairs because, first, an even graph has to be made.

"back.loaded": Sort all pairs such that the later variables appear the most frequently later in the sequence; an Eulerian path (+ see front.loaded concerning length)

108 zenplot

"balanced": Sort all pairs such that all variables appear in balanced blocks throughout the sequence (a Hamiltonian Decomposition; Eulerian, too).

"eulerian.cross": Generate a sequence of pairs such that each is formed with one variable from each group.

"greedy.weighted": Sort all pairs according to a greedy (heuristic) Euler path with x as weights visiting each edge precisely once.

"strictly.weighted": Strictly respect the order of the weights - so the first, second, third, and so on, adjacent pair of numbers of the output of zenpath() corresponds to the pair with largest, second-largest, third-largest, and so on, weight.

decreasing

A logical indicating whether the sorting is done according to increasing or decreasing weights.

Value

Returns a sequence of variables (indices or names, possibly a list of such), which can then be used to index the data (via groupData() for plotting via zenplot().

Author(s)

Marius Hofert and Wayne Oldford

See Also

```
zenplot() which provides the zenplot.
```

Other tools related to constructing zenpaths: connect_pairs(), extract_pairs(), graph_pairs(), groupData(), indexData()

Examples

```
## Some calls of zenpath()
zenpath(10) # integer argument
## Note that the result is of length 50 > 10 choose 2 as the underlying graph has to
## be even (and thus edges are added here)
(zp <- zenpath(c(3, 5), method = "eulerian.cross")) # integer(2) argument
```

zenplot

Main function to create a zenplot

Description

Constructs and draws a zigzag expanded navigation plot for a graphical exploratory analysis of a path of variables. The result is an alternating sequence of one-dimensional (1d) and two-dimensional (2d) plots laid out in a zigzag-like structure so that each consecutive pair of 2d plots has one of its variates (or coordinates) in common with that of the 1d plot appearing between them.

Usage

```
zenplot(x, turns = NULL,
        first1d = TRUE, last1d = TRUE,
        n2dcols = c("letter", "square", "A4", "golden", "legal"),
        n2dplots = NULL,
        plot1d = c("label", "points", "jitter", "density", "boxplot", "hist",
                    "rug", "arrow", "rect", "lines", "layout"),
     plot2d = c("points", "density", "axes", "label", "arrow", "rect", "layout"),
        zargs = c(x = TRUE, turns = TRUE, orientations = TRUE,
                  vars = TRUE, num = TRUE, lim = TRUE, labs = TRUE,
                   width1d = TRUE, width2d = TRUE,
                   ispace = match.arg(pkg) != "graphics"),
        lim = c("individual", "groupwise", "global"),
        labs = list(group = "G", var = "V", sep = ", ", group2d = FALSE),
        pkg = c("graphics", "grid", "loon"),
method = c("tidy", "double.zigzag", "single.zigzag", "rectangular"),
        width1d = if(is.null(plot1d)) 0.5 else 1,
        width2d = 10,
        ospace = if(pkg == "loon") 0 else 0.02,
        ispace = if(pkg == "graphics") 0 else 0.037,
        draw = TRUE,
        ...)
```

Arguments

Χ

A data object of "standard forms", being a vector, or a matrix, or a data. frame, or a list of any of these. In the case of a list, the components of x are interpreted as groups of data which are visually separated by a two-dimensional (group) plot.

turns

A character vector (of length two times the number of variables to be plotted minus 1) consisting of "d", "u", "r" or "1" indicating the turns out of the current plot position; if NULL, the turns are constructed (if x is of the "standard form" described above).

first1d

A logical indicating whether the first one-dimensional plot is included.

last1d

A logical indicating whether the last one-dimensional plot is included.

n2dcols

number of columns of 2d plots (≥ 1) or one of "letter", "square", "A4", "golden" or "legal" in which case a similar layout is constructed. Note that n2dcols is ignored if !is.null(turns).

n2dplots

The number of 2d plots.

plot1d

A function to use to return a one-dimensional plot constructed with package pkg. Alternatively, a character string of an existing function. For the defaults provided, the corresponding functions are obtained when appending _1d_graphics, _1d_grid or _1d_loon depending on which pkg is used.

If plot1d = NULL, then no 1d plot is produced in the zenplot.

plot2d

A function returning a two-dimensional plot constructed with package pkg. Alternatively, a character string of an existing function. For the defaults pro-

> vided, the corresponding functions are obtained when appending _2d_graphics, _2d_grid or _2d_loon depending on which pkg is used.

As for plot1d, plot2d omits 2d plots if plot2d = NULL.

A fully named logical vector indicating whether the respective arguments are zargs

(possibly) passed to plot1d() and plot2d() (if the latter contain the formal argument zargs, which they typically do/should, but see below for an example

in which they do not).

zargs can maximally contain all variables as given in the default. If one of those variables does not appear in zargs, it is treated as TRUE and the corresponding arguments are passed on to plot1d and plot2d. If one of them is set to FALSE, the argument is not passed on.

lim (x-/y-) axis limits. This can be a character string or a numeric (2).

If lim = "groupwise" and x does not contain groups, the behaviour is equivalent

to lim = "global".

The plot labels to be used; see the argument labs of burst() for the exact specification. labs can, in general, be anything as long as plot1d and plot2d

know how to deal with it.

The R package used for plotting (depends on how the functions plot1d and pkg plot2d were constructed; the user is responsible for choosing the appropriate

package among the supported ones).

method The type of zigzag plot (a character).

Available are:

tidy: more tidied-up double.zigzag (slightly more compact placement of plots towards the end).

double.zigzag: zigzag plot in the form of a flipped "S". Along this path, the plots are placed in the form of an "S" which is rotated counterclockwise by 90 degrees.

single.zigzag: zigzag plot in the form of a flipped "S".

rectangular: plots that fill the page from left to right and top to bottom. This is useful (and most compact) for plots that do not share an axis.

Note that method is ignored if turns are provided.

width1d A graphical parameter > 0 giving the width of 1d plots.

width2d A graphical parameter > 0 giving the height of 2d plots.

ospace The outer space around the zenplot. A vector of length four (bottom, left, top, right), or one whose values are repeated to be of length four, which gives the outer space between the device region and the inner plot region around the zen-

Values should be in [0,1] when pkg is "graphics" or "grid", and as number

of pixels whenpkg is "loon".

The inner space in [0, 1] between the each figure region and the region of the

(1d/2d) plot it contains. Again, a vector of length four (bottom, left, top, right) or a shorter one whose values are repeated to produce a vector of length four.

A logical indicating whether a the zenplot is immediately displayed (the default) or not.

labs

ispace

draw

arguments passed to the drawing functions for both plot1d and plot2d. If you need to pass certain arguments only to one of them, say, plot2d, consider providing your own plot2d; see the examples below.

Value

(besides plotting) invisibly returns a list having additional classnames marking it as a zenplot and a zenPkg object (with Pkg being one of Graphics, Grid, or Loon, so as to identify the package used to construct the plot).

As a list it contains at least the path and layout (see unfold for details).

Depending on the graphics package pkg used, the returned list includes additional components. For pkg = "grid", this will be the whole plot as a grob (grid object). For pkg = "loon", this will be the whole plot as a loon plot object as well as the toplevel tk object in which the plot appears.

See Also

All provided default plot1d and plot2d functions.

extract_1d() and extract_2d() for how zargs can be split up into a list of columns and corresponding group and variable information.

burst() for how x can be split up into all sorts of information useful for plotting (see our default plot1d and plot2d). vport() for how to construct a viewport for (our default) **grid** (plot1d and plot2d) functions.

extract_pairs(), connect_pairs(), group() and zenpath() for (zen)path-related functions.

The various vignettes for additional examples.

Other creating zenplots: unfold()

Examples

```
## Generate some data
n <- 1000 # sample size
d <- 20 # dimension
set.seed(271) # set seed (for reproducibility)
x <- matrix(rnorm(n * d), ncol = d) # i.i.d. N(0,1) data

## A basic zenplot
res <- zenplot(x)
uf <- unfold(nfaces = d - 1)
## `res` and `uf` is not identical as `res` has specific
## class attributes.
for(name in names(uf)) {
   stopifnot(identical(res[[name]], uf[[name]]))
}</pre>
```

```
## => The return value of zenplot() is the underlying unfold()
## Some missing data
z <- x
z[seq\_len(n-10), 5] \leftarrow NA \# all NA except 10 points
zenplot(z)
## Another column with fully missing data (use arrows)
## Note: This could be more 'compactified', but is technically
        more involved
z[, 6] <- NA # all NA
zenplot(z)
## Lists of vectors, matrices and data frames as arguments (=> groups of data)
## Only two vectors
z \leftarrow list(x[,1], x[,2])
zenplot(z)
## A matrix and a vector
z \leftarrow list(x[,1:2], x[,3])
zenplot(z)
## A matrix, NA column and a vector
z \leftarrow list(x[,1:2], NA, x[,3])
zenplot(z)
z \leftarrow list(x[,1:2], cbind(NA, NA), x[,3])
zenplot(z)
z \leftarrow list(x[,1:2], 1:10, x[,3])
zenplot(z)
## Without labels or with different labels
z \leftarrow list(A = x[,1:2], B = cbind(NA, NA), C = x[,3])
zenplot(z, labs = NULL) # without any labels
zenplot(z, labs = list(group = NULL, group2d = TRUE)) # without group labels
zenplot(z, labs = list(group = NULL)) # without group labels unless groups change
zenplot(z, labs = list(var = NULL)) # without variable labels
zenplot(z, labs = list(var = "Variable ", sep = " - ")) # change default labels
## Example with a factor
zenplot(iris)
zenplot(iris, lim = "global") # global scaling of axis
zenplot(iris, lim = "groupwise") # acts as 'global' here (no groups in the data)
## Note: The third component (data.frame) naturally has default labels.
        zenplot() uses these labels and prepends a default group label.
z \leftarrow list(x[,1:5], x[1:10, 6:7], NA,
          data.frame(x[seq\_len(round(n/5)), 8:19]), cbind(NA, NA), x[1:10, 20])
zenplot(z, labs = list(group = "Group")) # change the group label (var and sep are defaults)
## Alternatively, give z labels
names(z) <- paste("Group", LETTERS[seq_len(length(z))]) # give group names</pre>
```

```
zenplot(z) # uses given group names
## Now let's change the variable labels
z. <- lapply(z, function(z.) {</pre>
                  if(!is.matrix(z.)) z. <- as.matrix(z.)</pre>
                  colnames(z.) <- paste("Var.", seq_len(ncol(z.)))</pre>
                  }
          )
zenplot(z.)
### A dynamic plot based on 'loon' (if installed and R compiled with tcl support)
## Not run:
   if(requireNamespace("loon", quietly = TRUE))
       zenplot(x, pkg = "loon")
## End(Not run)
## A basic example
turns <- c("1","d","d","r","r","d","d","r","r","u","u","r","r","r","u","u","l","l",
          "d", "d", "r", "r", "d", "d")
zenplot(x, plot1d = "layout", plot2d = "layout", turns = turns) # layout of plot regions
## => The tiles stick together as ispace = 0.
zenplot(x, plot1d = "layout", plot2d = "layout", turns = turns,
       pkg = "grid") # layout of plot regions with grid
## => Here the tiles show the small (default) ispace
## Another example (with own turns and groups)
zenplot(list(x[,1:3], x[,4:7]), plot1d = "arrow", plot2d = "rect",
       turns = c("d", "r", "r", "r", "r", "d",
                "d", "l", "l", "l", "l"), last1d = FALSE)
## Creating a box
zenplot(x, plot1d = "label", plot2d = function(zargs)
   density_2d_graphics(zargs, box = TRUE))
## With grid
   zenplot(x, plot1d = "label", plot2d = function(zargs)
       density_2d_grid(zargs, box = TRUE), pkg = "grid")
## An example with width1d = width2d and where no zargs are passed on.
## Note: This could have also been done with 'rect_2d_graphics(zargs, col = ...)'
##
       as plot1d and plot2d.
```

```
myrect <- function(...) {</pre>
   plot(NA, type = "n", ann = FALSE, axes = FALSE, xlim = 0:1, ylim = 0:1)

        plot2d = function(zargs) my_points_2d_ggplot(zargs, extract2d = FALSE),
        pkg = "grid")
## Danger zone: An example with a new data structure (here: a list of *lists*)
## Note: - In this case, we most likely need to provide both plot1d and plot2d
##
           (but not in this case here since arrow_1d_graphics() does not depend
##
           on the data structure)
         - Note that we still make use of zargs here.
##
##
         - Also note that the variables are not correctly aligned anymore:
           In the ggplot2 examples we guaranteed this by plot_indices(),
##
           but here we don't. This then still produces our layout but the
##
           \ensuremath{\text{x/y}} axis of adjacent plots might not be the same anymore. This is
##
           fine if only a certain order of the plots is of interest, but
           not a comparison between adjacent plots.

zenplots

zenplots: Zigzag Expanded Navigation Plots

Description

Zenplots, like pairs plots (scatterplot matrices), lay out a large number of one- and two-dimensional plots in an organized way.

Details

Unlike pairs plots, zenplots can lay out a much larger number of plots by pursuing a zigzagging layout (following a zenpath) of alternating one- and two-dimensional plots.

The plots can be created by R's base graphics package, by the grid graphics package, or even made interactive (brushing, etc.) by using using the loon package.
