Package 'clickstream'

September 27, 2023

| Type Package | | | |
|--|--|--|--|
| Title Analyzes Clickstreams Based on Markov Chains | | | |
| Version 1.3.3 | | | |
| Date 2023-09-27 | | | |
| Author Michael Scholz, Theo van Kraay | | | |
| Maintainer Michael Scholz <michael.scholz@th-deg.de></michael.scholz@th-deg.de> | | | |
| Encoding UTF-8 | | | |
| Description A set of tools to read, analyze and write lists of click sequences on websites (i.e., clickstream). A click can be represented by a number, character or string. Clickstreams can be modeled as zero- (only computes occurrence probabilities), first- or higher-order Markov chains. | | | |
| License GPL-2 | | | |

Description

clickstream-package

This package allows modeling clickstreams with Markov chains. It supports to model clickstreams as zero-order, first-order or higher-order Markov chains.

Analyzes Clickstreams Based on Markov Chains

Details

+,Pattern,Pattern-method

Package: clickstream
Type: Package
Version: 1.3.3
Date: 2023-09-27
License: GPL-2

Depends: R (>= 3.0), methods

Author(s)

Michael Scholz <michael.scholz@th-deg.de>
Theo van Kraay <theo.vankraay@hotmail.com>

Examples

+,Pattern,Pattern-method

Concatenates two Pattern objects

Description

Concatenates two Pattern objects

4 absorbingStates

Usage

```
## S4 method for signature 'Pattern,Pattern'
e1 + e2
```

Arguments

e1 First pattern

e2 Second pattern

Methods

```
list("signature(e1 = \"Pattern\", e2 = \"Pattern\")") Concatenates two Pattern objects.
```

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

 $absorbing {\tt States}$

Returns All Absorbing States

Description

Returns All Absorbing States

Usage

```
absorbingStates(object)
```

Arguments

object

An instance of the MarkovChain-class

Methods

list("signature(object = \"MarkovChain\")") Returns the names of all states that never have a successor in a clickstream (i.e. that are absorbing).

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

as.ClickClust 5

as.ClickClust

Coerces a Clickstream Object to a ClickClust Object

Description

Coerces a Clickstream object to a ClickClust object.

Usage

```
as.ClickClust(clickstreamList)
```

Arguments

clickstreamList

A list of clickstreams.

Value

A list consisting of a dataset X and a vector of initial states y

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

See Also

frequencies

6 as.clickstreams

| | - | | |
|----|---|---------|-----|
| as | c | ickstre | ams |

Converts a character vector or a character list into a clickstream list.

Description

Converts a character vector or a character list into a clickstream list. Note that non-alphanumeric characters will be removed.

Usage

```
as.clickstreams(obj, sep = ",", header = TRUE)
```

Arguments

| ob j The character vector or character list which will be | converted into a clickstream |
|---|------------------------------|
|---|------------------------------|

list. Each line of the vector must represent exactly one click stream.

sep The character separating clicks (default is ",").

header A logical flag indicating whether the first entry of each entry in the character

vector is the name of the clickstream.

Value

A list of clickstreams. Each element is a vector of characters representing the clicks. The name of each list element is either extracted from the character vector or a unique number.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

See Also

```
print.Clickstreams, randomClickstreams
```

as.moltenTransactions 7

as.moltenTransactions Coerces a Clickstream Object to a Transactions Object

Description

Coerces a Clickstream object to a transactions object.

Usage

```
as.moltenTransactions(clickstreamList)
```

Arguments

clickstreamList

A list of clickstreams.

Value

An instance of the old class transactions

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

See Also

frequencies

8 as.transactions

as.transactions

Coerces a Clickstream Object to a Transactions Object

Description

Coerces a Clickstream object to a transactions object.

Usage

```
as.transactions(clickstreamList)
```

Arguments

clickstreamList

A list of clickstreams.

Value

An instance of the class transactions

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

See Also

frequencies

chiSquareTest 9

| chiSquareTest Calculates the chi-square statistic |
|---|
|---|

Description

Calculates the chi-Square statistic, p-value, and degrees of freedom, for the first-order transition matrix of a MarkovChain object compared with observed state changes.

Usage

```
chiSquareTest(cls, mc)
```

Arguments

cls The clickstream object.

mc The Markov chain against which to compare the clickstream data. Please note

that the first-order transition matrix is used for performing the chi-square test.

Author(s)

Theo van Kraay <theo.vankraay@hotmail.com>

Examples

clusterClickstreams

Performs K-Means Clustering on a List of Clickstreams

Description

Performs k-means clustering on a list of clickstreams. For each clickstream a transition matrix of a given order is computed. These transition matrices are used as input for performing k-means clustering.

10 clusterClickstreams

Usage

```
clusterClickstreams(clickstreamList, order = 0, centers, ...)
```

Arguments

clickstreamList

A list of clickstreams for which the cluster analysis is performed.

order The order of the transition matrices used as input for clustering (default is 0; 0

and 1 are possible).

centers The number of clusters.

... Additional parameters for k-means clustering (see kmeans).

Value

This method returns a ClickstreamClusters object (S3-class). It is a list with the following components:

clusters The resulting list of Clickstreams objects.

centers A matrix of cluster centres.

states Vector of states

totss The total sum of squares.

withinss Vector of within-cluster sum of squares, one component per cluster.

tot.withinss Total within-cluster sum of squares, i.e., sum(withinss).

betweenss The between-cluster sum of squares, i.e., totss - tot.withinss.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

See Also

```
print.ClickstreamClusters, summary.ClickstreamClusters
```

EvaluationResult-class 11

EvaluationResult-class

Class EvaluationResult

Description

Class EvaluationResult

Objects from the Class

Objects can be created by calls of the form new("EvaluationResult", ...). This S4 class describes EvaluationResult objects.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

See Also

mcEvaluate

Examples

show EvaluationResult definition
showClass("EvaluationResult")

fitMarkovChain

Fits a List of Clickstreams to a Markov Chain

Description

This function fits a list of clickstreams to a Markov chain. Zero-order, first-order as well as higher-order Markov chains are supported. For estimating higher-order Markov chains this function solves the following linear or quadratic programming problem:

$$\min \left| \left| \sum_{i=1}^{k} X - \lambda_i Q_i X \right| \right|$$
s.t.
$$\sum_{i=1}^{k} \lambda_i = 1$$

$$\lambda_i \ge 0$$

The distribution of states is given as X. λ_i is the lag parameter for lag i and Q_i the transition matrix.

12 fitMarkovChain

Usage

```
fitMarkovChain(clickstreamList, order = 1, verbose = TRUE, control = list())
```

Arguments

clickstreamList

A list of clickstreams for which a Markov chain is fitted.

order (Optional) The order of the Markov chain that is fitted from the clickstreams.

Per default, Markov chains with order=1 are fitted. It is also possible to fit

zero-order Markov chains (order=0) and higher-order Markov chains.

verbose (Optional) An optimal logical variable to indicate whether warnings and infos

should be printed.

control (Optional) The control list of optimization parameters. Parameter optimizer

specifies the type of solver used to solve the given optimization problem. Possible values are "linear" (default) and "quadratic". Parameter use.lpSolve deter-

mines whether lpSolve or linprog is used as linear solver.

Details

For solving the quadratic programming problem of higher-order Markov chains, an augmented Lagrange multiplier method from the package Rsolnp is used.

Value

Returns a MarkovChain object.

Note

At least half of the clickstreams need to consist of as many clicks as the order of the Markov chain that should be fitted.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

References

This method implements the parameter estimation method presented in Ching, W.-K. et al.: *Markov Chains – Models, Algorithms and Applications*, 2nd edition, Springer, 2013.

fitMarkovChains 13

Examples

fitMarkovChains

Generates a list of markov chains from a given set of clusters

Description

The purpose of this function is to generate pre-computed markov chain objects from clusters of clickstreams.

Usage

```
fitMarkovChains(clusters, order = 1)
```

Arguments

clusters The clusters from which to generate markov chain objects.

order The order for the markov chain.

Author(s)

Theo van Kraay <theo.vankraay@hotmail.com>

14 frequencies

```
clusters <- clusterClickstreams(trainingCLS, centers = 2)
markovchains <- fitMarkovChains(clusters, order = 1)</pre>
```

frequencies

Generates a Data Frame of State Frequencies for All Clickstreams in a List of Clickstreams

Description

Generates a data frame of state frequencies for all clickstreams in a list of clickstreams.

Usage

```
frequencies(clickstreamList)
```

Arguments

clickstreamList

A list of clickstreams.

Value

A data frame containing state frequencies for each clickstream.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

See Also

transactions

getConsensusClusters 15

getConsensusClusters Generates an optimal set of clusters for a clickstream object based on consensus clustering.

Description

This is an experimental function for a consensus clustering algorithm based on targeting a range of average next state probabilities derived when fitting each cluster to a markov chain.

Usage

```
getConsensusClusters(
   trainingCLS,
   testCLS,
   maxIterations = 5,
   optimalProbMean = 0.5,
   range = 0.3,
   centresMin = 2,
   clusterCentresRange = 0,
   order = 1,
   takeHighest = FALSE,
   verbose = FALSE
)
```

Arguments

trainingCLS Clickstream object with training data (this should be the data used to build the

markov chain object).

testCLS Clickstream object with test data.

maxIterations Number of times to iterate (repeat) through the k-means clustering.

optimalProbMean

The target average probability of each next page click prediction in a 1st order

markov chain.

range The range above the optimal probability to target.

centresMin The minimum cluster centres to evaluate.

clusterCentresRange

the additional cluster centres to evaluate.

order The order for markov chains that will be used to evaluate each cluster.

takeHighest Determines whether to default to the highest mean next click probability, or error

if the target is not reached after the given number of k-means iterations.

verbose Should this function report extra information on progress?

Author(s)

predict(mc, startPattern)
```

getConsensusClustersParallel

Generates an optimal set of clusters for a clickstream based on consensus clustering and with parallel computation

Description

This is an experimental function for a consensus clustering algorithm based on targeting a range of average next state probabilities derived when fitting each cluster to a markov chain. This function parallelizes k-means and fitToMarkovChain operations across computer cores, and depends on the parallel package to function.

Usage

```
getConsensusClustersParallel(
  trainingCLS,
  testCLS,
  maxIterations = 5,
  optimalProbMean = 0.5,
  range = 0.3,
  centresMin = 2,
```

```
clusterCentresRange = 0,
order = 1,
cores = 2,
takeHighest = FALSE,
verbose = FALSE
)
```

Arguments

trainingCLS Clickstream object with training data (this should be the data used to build the

markov chain object).

testCLS Clickstream object with test data.

maxIterations Number of times to iterate (repeat) through the k-means clustering.

optimalProbMean

The target average probability of each next page click prediction in a 1st order

markov chain.

range The range above the optimal probability to target.

centresMin The minimum cluster centres to evaluate.

clusterCentresRange

the additional cluster centres to evaluate.

order The order for markov chains that will be used to evaluate each cluster.

cores Number of cores used for clustering.

takeHighest Determines whether to default to the highest mean next click probability, or error

if the target is not reached after the given number of k-means iterations.

verbose Should this function report extra information on progress?

Author(s)

Theo van Kraay <theo.vankraay@hotmail.com>

getOptimalMarkovChain Generates the optimal markov chains from a list of markov chains and corresponding clusters

Description

The purpose of this function is to predict from a pattern using pre-computed markov chains and corresponding clusters. The markov chain corresponding with the cluster that is the best fit to the prediction value is used.

Usage

```
getOptimalMarkovChain(startPattern, markovchains, clusters)
```

Arguments

startPattern The pattern object to be used.

markovchains The pre-computed markov chains generated from a set of clusters.

clusters The corresponding clusters (should be in the corresponding order as the markov chains).

Author(s)

Theo van Kraay <theo.vankraay@hotmail.com>

hmPlot 19

```
testCLS <- as.clickstreams(test, header = TRUE)

clusters <- clusterClickstreams(trainingCLS, centers = 2)
markovchains <- fitMarkovChains(clusters, order = 1)
startPattern <- new("Pattern", sequence = c("c"))
mc <- getOptimalMarkovChain(startPattern, markovchains, clusters)
predict(mc, startPattern)</pre>
```

hmPlot

Plots a Heatmap

Description

Plots a Heatmap

Usage

```
hmPlot(
  object,
  order = 1,
  absorptionProbability = FALSE,
  title = NA,
  lowColor = "yellow",
  highColor = "red",
  flip = FALSE
)
```

Arguments

object The MarkovChain for which a heatmap is plotted.

Order of the transition matrix that should be plotted. Default is 1.

absorptionProbability

Should the heatmap show absorption probabilities? Default is FALSE.

title Title of the heatmap.

lowColor Color for the lowest transition probability of 0. Default is "yellow". highColor Color for the highest transition probability of 1. Default is "red".

flip Flip to horizontal plot. Default is FALSE.

Methods

list("signature(object = \"MarkovChain\")") Plots a heatmap for a specified transition matrix or the absorption probability matrix of a given MarkovChain object.

fitMarkovChain

Examples

initialize, Pattern-method

Creates a new Pattern object

Description

Creates a new Pattern object

Usage

```
## S4 method for signature 'Pattern'
initialize(.Object, sequence, probability, absorbingProbabilities, ...)
```

Arguments

```
.0bject Pattern (name of the class)

sequence Click sequence

probability Probability for the click sequence

absorbingProbabilities

Probabilities that the sequence will finally end in one of the absorbing states

... Further arguments for the CallNextMethod function
```

Methods

```
list("signature(sequence = \"character\", probability = \"numeric\", absorbingProbabilities = \"numeric\"))

Creates a new Pattern object.
```

Examples

mcEvaluate

Evaluates the number of occurrences of predicted next clicks

Description

Evaluates the number of occurrences of predicted next clicks vs. total number of starting pattern occurrences in a given clickstream. The predicted next click can be a markov chain of any order.

22 mcEvaluateAll

Usage

```
mcEvaluate(mc, startPattern, testCLS)
```

Arguments

mc a markovchain object (this should have been built from a set of training data)
startPattern the starting pattern we want to predict next click on, and evaluate observed oc-

currences in test data.

testCLS clickstream object with test data

Author(s)

Theo van Kraay <theo.vankraay@hotmail.com>

Examples

```
training <- c("User1,h,c,c,p,c,h,c,p,p,c,p,p,o",
               "User2,i,c,i,c,c,c,d",
               "User3,h,i,c,i,c,p,c,c,p,c,c,i,d",
               "User4,c,c,p,c,d")
test <- c("User1,h,h,h,h,c,c,p,p,h,c,p,p,c,p,p,o",
           "User2,i,c,i,c,c,c,d",
           "User4,c,c,c,c,d,c,c,c,c")
csf <- tempfile()</pre>
writeLines(training, csf)
trainingCLS <- readClickstreams(csf, header = TRUE)</pre>

startPattern <- new("Pattern", sequence = c("c","c"))</pre>
res <- mcEvaluate(mc, startPattern, testCLS)</pre>
res
```

mcEvaluateAll

Evaluates all next page clicks in a clickstream training data set against a test data

Description

Evaluates all next page clicks in a clickstream training data set against a test data. Handles higher order by cycling through every possible pattern permutation. Produces a report of observed and expected values in a matrix.

mcEvaluateAll 23

Usage

```
mcEvaluateAll(
   mc,
   trainingCLS,
   testCLS,
   includeChiSquare = TRUE,
   returnChiSquareOnly = FALSE
)
```

Arguments

mc A markovchain object that corresponds to a list of clusters.

trainingCLS Clickstream object with training data (this should be the data used to build the

markov chain object).

testCLS Clickstream object with test data.

includeChiSquare

Should the result include the chi-square value?

returnChiSquareOnly

Should the result only consist of the chi-square value?

Author(s)

Theo van Kraay <theo.vankraay@hotmail.com>

mcEvaluate

24 mcEvaluateAllClusters

mcEvaluateAllClusters Evaluates all next page clicks in a clickstream training data set against a test data

Description

Evaluates all next page clicks in a clickstream training data set against a test data on the basis of a set of pre-computed Markov chains and corresponding clusters. Handles higher order by cycling through every possible pattern permutation. Produces and produces a report of observed and expected values in a matrix

Usage

```
mcEvaluateAllClusters(
  markovchains,
  clusters,
  testCLS,
  trainingCLS,
  includeChiSquare = TRUE,
  returnChiSquareOnly = FALSE
)
```

Arguments

markovchains A list of MarkovChain-objects.

clusters The list of clusters.

testCLS Clickstream object with test data.

trainingCLS Clickstream object with training data (this should be the data used to build the

markov chain object).

 $include {\tt ChiSquare}$

Should the result include the chi-square value?

returnChiSquareOnly

Should the result only consist of the chi-square value?

randomClicks

Examples

plot, MarkovChain-method

Plots a MarkovChain object

Description

Plots a MarkovChain object

Usage

```
## S4 method for signature 'MarkovChain'
plot(x, order = 1, digits = 2, minProbability = 0, ...)
```

Arguments

| X | An instance of the MarkovChain-class |
|----------------|---|
| order | The order of the transition matrix that should be plotted |
| digits | The number of digits of the transition probabilities |
| minProbability | Only transitions with a probability >= the specified minProbability will be shown |
| • • • | Further parameters for the plot-function in package igraph |

Methods

list("signature(x = \"MarkovChain\", order = \"numeric\", digits = \"numeric\")") Plots the transition matrix with order order of a MarkovChain object as graph.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

predict, MarkovChain-method

Predicts the Next Click(s) of a User

Description

Predicts the Next Click(s) of a User

Usage

```
## S4 method for signature 'MarkovChain'
predict(object, startPattern, dist = 1, ties = "random")
```

Arguments

object The MarkovChain used for predicting the next click(s)

startPattern Starting clicks of a user as Pattern object. A Pattern with an empty sequence

is also possible.

dist (Optional) The number of clicks that should be predicted (default is 1).

ties (Optional) The strategy for handling ties in predicting the next click. Possible

strategies are random (default) and first.

Methods

list("signature(object = \"MarkovChain\")") This method predicts the next click(s) of a user.
The first clicks of a user are given as Pattern object. The next click(s) are predicted based on
the transition probabilities in the MarkovChain object. The probability distribution of the next
click (n) is estimated as follows:

$$X^{(n)} = B \cdot \sum_{i=1}^{k} \lambda_i Q_i X^{(n-i)}$$

The distribution of states at time n is given as X^n . The transition matrix for lag i is given as Q_i . λ_i specifies the lag parameter and B the absorbing probability matrix.

predict.ClickstreamClusters

Predicts the Cluster for a Given Pattern Object

Description

Predicts the cluster for a given Pattern object. Potential clusters need to be identified with the method clusterClickstreams before predicting the cluster.

Usage

```
## S3 method for class 'ClickstreamClusters'
predict(object, pattern, ...)
```

Arguments

object A ClickstreamClusters object containing the clusters. ClickstreamClusters represent the result of a cluster analysis on a list of clickstreams (see clusterClickstreams).

Sequence of a user's initial clicks as Pattern object.

... Ignored parameters.

Value

Returns the index of the clusters to which the given Pattern object most probably belongs to.

randomClickstreams 33

 ${\tt randomClickstreams}$

Generates a List of Clickstreams

Description

Generates a list of clickstreams by randomly walking through a given transition matrix.

Usage

```
randomClickstreams(
   states,
   startProbabilities,
   transitionMatrix,
   meanLength,
   n = 100
)
```

Arguments

```
states Names of all possible states.

startProbabilities
Start probabilities for all states.

transitionMatrix
Matrix of transition probabilities.

meanLength Average length of the click streams.

n Number of click streams to be generated.
```

Value

Returns a list of clickstreams.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

See Also

fitMarkovChain, readClickstreams, print.Clickstreams

```
# generate a simple list of click streams states <- c("a", "b", "c") startProbabilities <- c(0.2, 0.5, 0.3) transitionMatrix <- matrix(c(0, 0.4, 0.6, 0.3, 0.1, 0.6, 0.2, 0.8, 0), nrow = 3) cls <- randomClickstreams(states, startProbabilities, transitionMatrix, meanLength = 5, n = 10) print(cls)
```

34 readClickstreams

| readClickstreams |
|------------------|
|------------------|

Reads a List of Clickstreams from File

Description

Reads a list of clickstream from a csv-file. Note that non-alphanumeric characters will be removed.

Usage

```
readClickstreams(file, sep = ",", header = FALSE)
```

Arguments

file The name of the file which the clickstreams are to be read from. Each line of

the file appears as one click stream. If it does not contain an absolute path, the

file name is relative to the current working directory, getwd.

sep The character separating clicks (default is ",").

header A logical flag indicating whether the first entry of each line in the file is the name

of the clickstream user.

Value

A list of clickstreams. Each element is a vector of characters representing the clicks. The name of each list element is either the header of a clickstream file or a unique number.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

Arguments

object

An instance of the EvaluationResult-class

Methods

list("signature(object = \"EvaluationResult\")") Shows an EvaluationResult object.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

show, MarkovChain-method

Shows a MarkovChain object

Description

Shows a MarkovChain object

Usage

```
## S4 method for signature 'MarkovChain'
show(object)
```

Arguments

object

An instance of the MarkovChain-class

Methods

list("signature(object = \"MarkovChain\")") Shows an MarkovChain object.

36 states

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

show, Pattern-method

Shows a Pattern object

Description

Shows a Pattern object

Usage

```
## S4 method for signature 'Pattern'
show(object)
```

Arguments

object

An instance of the Pattern-class

Methods

list("signature(object = \"Pattern\")") Shows a Pattern object.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

states

Returns All States

Description

Returns All States

Usage

```
states(object)
```

Arguments

object

An instance of the MarkovChain-class

Methods

list("signature(object = \"MarkovChain\")") Returns the name of all states of a MarkovChain
 object.

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

summary, MarkovChain-method

Prints the Summary of a MarkovChain Object

Description

Prints the Summary of a MarkovChain Object

Usage

```
## S4 method for signature 'MarkovChain'
summary(object)
```

Arguments

object

An instance of the MarkovChain-class

Value

Returns a MarkovChainSummary object.

```
list("desc") A short description of the MarkovChain object.
```

list("observations")

The number of observations from which the MarkovChain has been fitted.

list("k") The number of estimation parameters.

list("logLikelihood")

The maximal log-likelihood of the MarkovChain estimation.

list("aic") Akaike's Information Criterion for the MarkovChain object

list("bic") Bayesian Information Criterion for the MarkovChain object

Methods

list("signature(object = \"MarkovChain\")") Generates a summary for a given MarkovChain
 object

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

```
summary.ClickstreamClusters
```

Prints a Summary of a ClickstreamCluster Object

Description

Prints a summary of a ClickstreamCluster object. A ClickstreamClusters object represents the result of a cluster analysis on a list of clickstreams (see clusterClickstreams).

Usage

```
## S3 method for class 'ClickstreamClusters'
summary(object, ...)
```

Arguments

```
object A ClickstreamClusters object returned by clusterClickstreams.
... Ignored parameters.
```

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

40 writeClickstreams

transientStates

Returns All Transient States

Description

Returns All Transient States

Usage

```
transientStates(object)
```

Arguments

object

An instance of the MarkovChain-class

Methods

list("signature(object = \"MarkovChain\")") Returns the names of all states that have a non-zero probability that a user will never return to them (i.e. that are transient).

Author(s)

Michael Scholz <michael.scholz@th-deg.de>

writeClickstreams

Writes a List of Clickstreams to File

Description

Writes a list of clickstream to a csv-file.

Usage

```
writeClickstreams(
  clickstreamList,
  file,
  header = TRUE,
  sep = ",",
  quote = TRUE
)
```

writeClickstreams 41

Arguments

clickstreamList

The list of clickstreams to be written.

file The name of the file which the clickstreams are written to.

header A logical flag indicating whether the name of each clickstream element should

be used as first element.

sep The character used to separate clicks (default is ",").

quote A logical flag indicating whether each element of a clickstream will be sur-

rounded by double quotes (default is TRUE.
