Package 'schematic'

April 24, 2025		
Title Tidy Schema Validation for Data Frames		
Version 0.1.0		
Description Validate data.frames against schemas to ensure that data matches expectations. Define schemas using 'tidyselect' and predicate functions for type consistency, nullability, and more. Schema failure messages can be tailored for nontechnical users and are ideal for user-facing applications such as in 'shiny' or 'plumber'.

check_schema

Validate a data.frame against a schema

Description

Validate a data.frame against a schema

Usage

```
check_schema(data, schema)
```

Arguments

data A data.frame to check

schema A Schema object created with 'schema()'

Value

invisible if validation passes, otherwise stops with error

```
my_schema <- schema(
  mpg ~ is.numeric
)
check_schema(mtcars, my_schema)</pre>
```

is_all_distinct 3

is_all_distinct

Check if all values in a vector are distinct

Description

Check if all values in a vector are distinct

Usage

```
is_all_distinct(x)
```

Arguments

Х

A vector

Value

TRUE if the vector has all unique values

Examples

```
is_all_distinct(c(1:5)) # TRUE
is_all_distinct(c(1, 1, 2)) # FALSE
```

is_incrementing

Check if the vector is sorted numerically or alphanumerically

Description

'NA's are not ignored and any vector with 'NA's will fail unless the whole vector is 'NA'.

Usage

```
is_incrementing(x)
```

Arguments

Х

A vector

Value

TRUE if the vector is sorted

```
is_incrementing(1:5) # TRUE
is_incrementing(letters[1:5]) # TRUE
is_incrementing(c(4, 3, 0)) # FALSE
```

is_positive_integer

is_non_null

Check if all values are not NA

Description

Check if all values are not NA

Usage

```
is_non_null(x)
```

Arguments

Х

A vector

Value

TRUE if the vector has no NA values

Examples

```
is_non_null(1:5) # TRUE
is_non_null(c(1, NA, 3)) # FALSE
```

is_positive_integer

Check if a vector has all positive integers

Description

A positive integer is a whole number that is greater than 0.

Usage

```
is_positive_integer(x)
```

Arguments

Χ

A vector

Details

This check requires 'is.integer(x)' to be true. If you want a more flexible check that allows for numbers of type 'numeric' but still want them to be integers, then use 'is_whole_number()'.

'NA's are ignored as long as they are 'NA_integer'.

is_text 5

Value

TRUE if all elements are positive integers (NA ignored)

Examples

```
is_positive_integer(c(1L, 2L, 4L)) # TRUE
is_positive_integer(2.4) # FALSE
is_positive_integer(-3) # FALSE
```

is_text

Check if a vector is text-based (character or factor)

Description

'NA's are ignored as long as they are 'NA_character_'.

Usage

```
is_text(x)
```

Arguments

Х

A vector

Value

TRUE if vector is either character or factor

Examples

```
is_text(letters[1:4]) # TRUE
is_text(as.factor(letters[1:4])) # TRUE
is_text(1) # FALSE
```

is_whole_number

Check if a vector has all whole numbers

Description

Similar to 'is_positive_integer()' but without the constraint that the underlying data type is actually integer. Useful if the numbers are stored as 'numeric' but you want to check that they are whole.

Usage

```
is_whole_number(x)
```

6 mod_infinitable

Arguments

x A vector

Details

'NA's are ignored.

Value

TRUE if all elements are whole numbers (NA ignored)

Examples

```
is_whole_number(c(2.0, 4.0)) # TRUE is_whole_number(c(-1.4)) # FALSE
```

mod_infinitable

Ignore infinite values in a predicate

Description

This modifies a predicate function to ignore Inf.

Usage

```
mod_infinitable(pred)
```

Arguments

pred

A predicate function

Value

A new predicate that ignores infinites

```
# The `is_incrementing` predicate will fail here
x <- c(1, Inf, 3)
is_incrementing(x) # FALSE

is_incrementing_inf <- mod_infinitable(is_incrementing)
is_incrementing_inf(x) # TRUE</pre>
```

mod_nullable 7

mod_nullable

Allow NA in a predicate

Description

This modifies a predicate function to ignore NAs.

Usage

```
mod_nullable(pred)
```

Arguments

pred

A predicate function

Value

A new predicate that allows NAs

Examples

```
# The `is_incrementing` predicate will fail if there are NAs
x <- c(1, NA, 3)
is_incrementing(x) # FALSE

is_incrementing_null <- mod_nullable(is_incrementing)
is_incrementing_null(x) # TRUE</pre>
```

print.Schema

Print method for Schema

Description

Print method for Schema

Usage

```
## S3 method for class 'Schema' print(x, ...)
```

Arguments

x Object of class Schema

... Other arguments passed to 'print()'

Value

invisible

8 schema

schema

Create a schema object

Description

Create a schema object

Usage

```
schema(...)
```

Arguments

... Formulae of the form tidyselect_expr ~ predicate

Value

A Schema object

```
# Simple schema with one declared column
my_schema <- schema(</pre>
  mpg ~ is.double
)
# Multiple columns
my_schema <- schema(</pre>
  Sepal.Length ~ is.numeric,
  Species ~ is.factor
# Use tidyselect syntax and anonymous functions
my_schema <- schema(</pre>
  starts_with("Sepal") ~ is.numeric,
  c(Petal.Length, Petal.Width) \sim function(x) all(x > 0)
)
# Use named arguments to customize error messages
my_schema <- schema(</pre>
  `Must be a positive number` = cyl \sim function(x) all(x > 0)
```
