## Package 'AnnoProbe'

November 14, 2022

```
Type Package
Title Annotate the Gene Symbols for Probes in Expression Array
Version 0.1.7
Date 2022-11-12
Maintainer Yonghe Xia <xiayh17@gmail.com>
Description We curated 147 of expression array, from 3 species(human,mouse,rat),
     3 companies ('Affymetrix', 'Illumina', 'Agilent'),
     by aligning the 'Fasta' sequences of all probes of each platform to their corresponding refer-
     ence genome,
     and then annotate them to genes.

annoGene

Annotate gene IDs according to GTF files in gencode

## Description

annoGene will return a data.frame of gene information or write them to a file (csv or html format). The user should set a list of genes to be annotated, with "ENSEMBL" or "SYMBOL" style.

#### Usage

```
annoGene(IDs, ID_type, species = "human", out_file)
```

#### **Arguments**

IDs a list of genes

ID\_type the type of input IDs, should be "ENSEMBL" or "SYMBOL" species choose human or mouse, or rat, default: human out\_file the filename, should be ".csv" or ".html".

#### Value

a dataframe which columns contain genesymbol, biotypes, ensembl ids and the positions of genes

```
IDs <- c("DDX11L1", "MIR6859-1", "OR4G4P", "OR4F5")
ID_type = "SYMBOL"
annoGene(IDs, ID_type)
annoGene(IDs, ID_type,out_file = tempfile(fileext = ".html"))
annoGene(IDs, ID_type,out_file = tempfile(fileext = ".csv"))</pre>
```

checkGPL 3

checkGPL

Check whether the input gpl in our platform list or not

#### **Description**

Check whether the input gpl in our platform list or not

#### Usage

```
checkGPL(GPL = NULL)
```

#### **Arguments**

**GPL** 

GPL(GEO platform) number, eg: GPL570

#### Value

returns a boolean value

## **Examples**

```
checkGPL('GPL570')
checkGPL('GPL15314')
checkGPL('GPL10558')
```

check\_diff\_genes

Check a list of genes how they show difference.

#### Description

How does a gene or a list of genes show difference between two group. The boxplot or heatmap will be drawed. just a wrap function of ggpubr and pheatmap.

## Usage

```
check_diff_genes(gene, genes_expr, group_list)
```

#### Arguments

gene A vector contains all gene ids of interest. Gene ids should be gene symbol.

genes\_expr An expression matrix, the rownames should be gene symbol.

group\_list A vector contains the group information of each samples in expression matrix

#### Value

A figure: boxplot or heatmap

deg\_heatmap

## **Examples**

```
attach(GSE95166)
check_diff_genes('LRCH3',genes_expr,group_list )

x=DEG$logFC
names(x)=rownames(DEG)
cg=c(names(head(sort(x),100)), names(tail(sort(x),100)))
check_diff_genes(cg,genes_expr,group_list )
```

deg\_heatmap

draw a heatmap for DEG result

## Description

deg\_heatmap will draw a heatmap for you.

#### Usage

```
deg_heatmap(deg, genes_expr, group_list, topn = 20)
```

## Arguments

deg the result from limma.

genes\_expr the expression matrix

group\_list, a vector

topn the number of genes in heatmap, default:20

#### Value

```
a ggplot2 style figure.
```

```
attach(GSE27533)
deg_heatmap(DEG,genes_expr,group_list)
```

deg\_volcano 5

deg\_volcano

draw a volcano for DEG result

#### **Description**

deg\_volcano will draw a volcano for you.

## Usage

```
deg_volcano(need_deg, style = 1, p_thred = 0.05, logFC_thred = 1)
```

## Arguments

need\_deg should be 3 columns : gene, logFC, p.value(or p.adjust

style you can try 1 or 2, default: 1

p\_thred default:0.05 logFC\_thred default:1

#### Value

```
a ggplot2 style figure.
```

## **Examples**

```
deg=GSE27533$DEG
need_deg=data.frame(symbols=rownames(deg), logFC=deg$logFC, p=deg$P.Value)
deg_volcano(need_deg,2)
deg_volcano(need_deg,1)
```

filterEM

Filter expression matrix based on annotation

#### **Description**

filterEM will annotate the probes in expression matrix and remove the duplicated gene symbols. because there will be many probes mapped to same genes, we will only keep the max value one.

## Usage

```
filterEM(probes_expr, probe2gene)
```

6 geoChina

## **Arguments**

probes\_expr is an expression matrix which rownames are probes of probe2gene and each

column is a sample

probe2gene the first column is probes and the second column is corresponding gene symbols

#### Value

a expression matrix which has been filtered duplicated gene symbols

#### **Examples**

```
attach(GSE95166)
# head(probes_expr)
# head(probe2gene)
genes_expr <- filterEM(probes_expr,probe2gene)
# head(genes_expr)</pre>
```

geoChina

Download expression dataset by GSE id

## Description

geoChina will download the expression matrix and phenotype data as ExpressionSet format from cloud in mainland China, it's a alternative method for getGEO function from GEOquery package. geoChina('gse1009') is the same as eSet=getGEO('gse1009', getGPL = F)

#### Usage

```
geoChina(gse = "GSE2546", mirror = "tencent", destdir = getwd())
```

#### **Arguments**

gse input GSE id, such as GSE1009, GSE2546, gse1009.

mirror "tencent" only for now.

destdir The destination directory for data downloads.

#### Value

a list of ExpressionSet, which contains the expression matrix and phenotype data

```
## Not run:
geoChina('GSE1009',destdir=tempdir())
## End(Not run)
```

getGPLList 7

getGPLList

Get all GPL list in our package getGPLList returns all the GPL number checklist stored in package

## Description

Get all GPL list in our package getGPLList returns all the GPL number checklist stored in package

#### Usage

```
getGPLList()
```

#### Value

a data.frame which contains the gpl and name of array.

GSE27533

An example dataset

## Description

A dataset containing genes\_expr, group\_list, DEG

## Usage

GSE27533

#### **Format**

A list with 6 elements:

```
genes_expr genes_expr, genes_expr
DEG DEG, DEG ...
```

8 idmap

GSE95166

An example dataset

## Description

A dataset containing eSet, probes\_expr, probe2gene, genes\_expr, group\_list, DEG

#### Usage

GSE95166

#### **Format**

A list with 6 elements:

```
probes_expr probes_expr, probes_expr
probe2gene probe2gene, probe2gene
genes_expr genes_expr, genes_expr
group_list group_list, group_list
DEG DEG, DEG ...
```

idmap

Get Probe Annotation

## Description

idmap returns probe annotations for input gpl

#### Usage

```
idmap(gpl = "GPL570", type = "bioc", mirror = "tencent", destdir = getwd())
```

## **Arguments**

gpl GPL(GEO platform) number, eg: GPL570

type source of probe annuation stored, one of "pipe", "bioc", "soft", default: "pipe"

mirror "tencent" only for now

destdir The destination directory for data downloads.

#### Value

probe annotaions

printGPLInfo 9

## **Examples**

```
ids=idmap('GPL570',destdir=tempdir())
ids=idmap('GPL570',type='soft',destdir=tempdir())
ids=idmap('GPL18084',type='pipe',destdir=tempdir())
```

printGPLInfo

Print GPL information

## Description

Print GPL information

## Usage

```
printGPLInfo(GPL = NULL)
```

## Arguments

GPL

GPL(GEO platform) number, eg: GPL570

#### Value

print detail information of the input GEO platform

```
printGPLInfo('GPL93')
```

# **Index**
