Package 'VARDetect'

June 15, 2024

Type Package

Title Multiple Change Point Detection in Structural VAR Models

Version 0.1.8

Author Yue Bai [aut, cre],

Peiliang Bai [aut],

Abolfazl Safikhani [aut],

George Michailidis [aut]

Maintainer Yue Bai <baiyue69@gmail.com>

Description Implementations of Thresholded Block Segmentation Scheme (TBSS) and Lowrank plus Sparse Two Step Procedure (LSTSP) algorithms for detecting multiple changes in structural VAR models. The package aims to address the problem of change point detection in piecewise stationary VAR models, under different settings regarding the structure of their transition matrices (autoregressive dynamics); specifically, the following cases are included: (i) (weakly) sparse, (ii) structured sparse, and (iii) low rank plus sparse. It includes multiple algorithms and related extensions from Safikhani and Shojaie (2020) <doi:10.1080/01621459.2020.1770097> and Bai, Safikhani and Michailidis (2020) <doi:10.1109/TSP.2020.2993145>.

detection_check

Function for detection performance check

Description

Function for detection performance check

Usage

```
detection_check(pts.final, brk, nob, critval = 5)
```

Arguments

 eeg 3

Value

a matrix of detection summary results, including the absolute error, selection rate and relative location. The absolute error of the locations of the estimated break points is defined as $error_j = |\tilde{t}_j^f - t_j|, j = 1, \dots, m_0$.

Examples

```
# an example of 10 replicates result
set.seed(1)
nob <- 1000
brk <- c(333, 666, nob+1)
cp.list <- vector('list', 10)</pre>
for(i in 1:10){
    cp.list[[i]] \leftarrow brk[1:2] + sample(c(-50:50),1)
# some replicate fails to detect all the change point
cp.list[[2]] <- cp.list[[2]][1]</pre>
cp.list[4] <- list(NULL)</pre>
                                # setting 4'th element to NULL.
# some replicate overestimate the number of change point
cp.list[[3]] <- c(cp.list[[3]], 800)</pre>
cp.list
res <- detection_check(cp.list, brk, nob, critval = 5)
# use a stricter critical value
res <- detection_check(cp.list, brk, nob, critval = 10)</pre>
res
```

eeg

EEG signal data

Description

EEG signal data

Usage

data(eeg)

Format

An dataframe of EEG signal data

Examples

data(eeg)
head(eeg)

4 eval_func

| | £ |
|------|-------|
| eval | THINC |
| | |

Evaluation function, return the performance of simulation results

Description

Evaluation function, return the performance of simulation results

Usage

```
eval_func(true_mats, est_mats)
```

Arguments

true_mats a list of true matrices for all segments, the length of list equals to the true number

of segments

est_mats a list of estimated matrices for all simulation replications, for each element, it is

a list of numeric matrices, representing the estimated matrices for segments

Value

A list, containing the results for all measurements

sensitivity A numeric vector, containing all the results for sensitivity over all replications

specificity A numeric vector, including all the results for specificity over all replications

accuracy A numeric vector, the results for accuracy over all replications

mcc A numeric vector, the results for Matthew's correlation coefficients over all replications

false_reps An integer vector, recording all the replications which falsely detects the change points, over-detect or under-detect

```
true_mats <- vector('list', 2)
true_mats[[1]] <- matrix(c(1, 0, 0.5, 0.8), 2, 2, byrow = TRUE)
true_mats[[2]] <- matrix(c(0, 0, 0.75), 2, 2, byrow = TRUE)
est_mats <- vector('list', 5)
for(i in 1:5){
    est_mats[[i]] <- vector('list', 2)
    est_mats[[i]][[1]] <- matrix(sample(c(0, 1, 2), size = 4, replace = TRUE), 2, 2, byrow = TRUE)
    est_mats[[i]][[2]] <- matrix(sample(c(0, 1), size = 4, replace = TRUE), 2, 2, byrow = TRUE)
}
perf_eval <- eval_func(true_mats, est_mats)</pre>
```

hausdorff_check 5

hausdorff_check

Function for Hausdorff distance computation

Description

The function includes two Hausdorff distance. The first one is hausdorff_true_est $(d(A_n, \tilde{A}_n^f))$: for each estimated change point, we find the closest true CP and compute the distance, then take the maximum of distances. The second one is hausdorff_est_true $(d(\tilde{A}_n^f, A_n))$: for each true change point, find the closest estimated change point and compute the distance, then take the maximum of distances.

Usage

```
hausdorff_check(pts.final, brk)
```

Arguments

```
pts.final a list of estimated change points
brk the true change points
```

Value

Hausdorff distance summary results, including mean, standard deviation and median.

```
## an example of 10 replicates result
set.seed(1)
nob <- 1000
brk <- c(333, 666, nob+1)
cp.list <- vector('list', 10)</pre>
for(i in 1:10){
    cp.list[[i]] \leftarrow brk[1:2] + sample(c(-50:50),1)
# some replicate fails to detect all the change point
cp.list[[2]] <- cp.list[[2]][1]</pre>
cp.list[4] <- list(NULL)</pre>
                                 # setting 4'th element to NULL.
# some replicate overestimate the number of change point
cp.list[[3]] <- c(cp.list[[3]], 800)</pre>
cp.list
res <- hausdorff_check(cp.list, brk)</pre>
res
```

6 lag_selection

lag_selection

Select the lag of the VAR model using total BIC method

Description

Select the lag of the VAR model (if the lag is unknown) using BIC method for total segments

Usage

```
lag_selection(
 data,
 method = c("sparse", "group sparse", "fLS"),
 group.case = c("columnwise", "rowwise"),
 group.index = NULL,
 lambda.1.cv = NULL,
  lambda.2.cv = NULL,
 mu = NULL,
 block.size = NULL,
 blocks = NULL,
  use.BIC = TRUE,
  an.grid = NULL,
  threshold = NULL,
  lag_candidates,
  verbose = FALSE
)
```

Arguments

| data | input data matrix, each column represents the time series component |
|----------------|---|
| method | method is sparse, group sparse and fixed lowrank plus sparse |
| group.case | two different types of group sparse, column-wise and row-wise, respectively. |
| group.index | specify group sparse index. Default is NULL. |
| lambda.1.cv | tuning parameter lambda_1 for fused lasso |
| lambda.2.cv | tuning parameter lambda_2 for fused lasso |
| mu | tuning parameter for low rank component, only available when method is set to "fLS". |
| block.size | the block size |
| blocks | the blocks |
| use.BIC | use BIC for k-means part |
| an.grid | a vector of an for grid searching. |
| threshold | a numeric argument, give the threshold for estimated model parameter matrices. Default is NULL. |
| lag_candidates | potential lag selection set |
| verbose | A Boolean argument, if TRUE, it provides detailed information. Default is FALSE |

1stsp 7

Value

selected lag for VAR series

select_lag An integer no less than 1 represents the selected lag of time series.

Examples

lstsp

Main function for the low rank plus sparse structure VAR model

Description

Main function for the low-rank plus sparse structure VAR model

```
lstsp(
  data,
  lambda.1 = NULL,
  mu.1 = NULL,
  lambda.1.seq = NULL,
  mu.1.seq = NULL,
  lambda.2 = NULL,
  mu.2 = NULL,
  lambda.3 = NULL,
  mu.3 = NULL,
  alpha_L = 0.25,
  omega = NULL,
  h = NULL,
  step.size = NULL,
  tol = 1e-04,
```

8 lstsp

```
niter = 100,
backtracking = TRUE,
skip = 5,
cv = FALSE,
nfold = NULL,
verbose = FALSE
)
```

Arguments

| data | A n by p dataset matrix |
|--------------|---|
| lambda.1 | tuning parameter for sparse component for the first step |
| mu.1 | tuning parameter for low rank component for the first step |
| lambda.1.seq | a sequence of lambda to the left segment for cross-validation, it's not mandatory to provide |
| mu.1.seq | a sequence of mu to the left segment, low rank component tuning parameter |
| lambda.2 | tuning parameter for sparse for the second step |
| mu.2 | tuning parameter for low rank for the second step |
| lambda.3 | tuning parameter for estimating sparse components |
| mu.3 | tuning parameter for estimating low rank components |
| alpha_L | a positive numeric value, indicating the restricted space of low rank component, default is 0.25 |
| omega | tuning parameter for information criterion, the larger of omega, the fewer final selected change points |
| h | window size of the first rolling window step |
| step.size | rolling step |
| tol | tolerance for the convergence in the second screening step, indicates when to stop |
| niter | the number of iterations required for FISTA algorithm |
| backtracking | A boolean argument to indicate use backtrack to FISTA model |
| skip | The number of observations need to skip near the boundaries |
| CV | A boolean argument, indicates whether the user will apply cross validation to select tuning parameter, default is FALSE |
| nfold | An positive integer, the number of folds for cross validation |
| verbose | If is TRUE, then it will print all information about current step. |

Value

A list object including

data the original dataset

 ${\bf q}$ the time lag for the time series, in this case, it is 1

cp Final estimated change points

plot.VARDetect.result 9

sparse_mats Final estimated sparse components

lowrank_mats Final estimated low rank components

est_phi Final estimated model parameter, equals to sum of low rank and sparse components **time** Running time for the LSTSP algorithm

Examples

```
nob <- 100
p <- 15
brk <- c(50, nob+1)
rank <- c(1, 3)
signals <- c(-0.7, 0.8)
singular_vals <- c(1, 0.75, 0.5)
info_ratio <- rep(0.35, 2)
try <- simu_var(method = "LS", nob = nob, k = p, lags = 1, brk = brk,
                sigma = as.matrix(diag(p)), signals = signals,
                rank = rank, singular_vals = singular_vals, info_ratio = info_ratio,
                sp_pattern = "off-diagonal", spectral_radius = 0.9)
data <- try$series
lambda1 = lambda2 = lambda3 <- c(2.5, 2.5)
mu1 = mu2 = mu3 < -c(15, 15)
fit <- lstsp(data, lambda.1 = lambda1, mu.1 = mu1,</pre>
             lambda.2 = lambda2, mu.2 = mu2,
             lambda.3 = lambda3, mu.3 = mu3, alpha_L = 0.25,
             step.size = 5, niter = 20, skip = 5,
             cv = FALSE, verbose = FALSE)
summary(fit)
plot(fit, data, display = "cp")
plot(fit, data, display = "param")
```

Description

Plotting method for S3 object of class VARDetect.result

```
## S3 method for class 'VARDetect.result'
plot(
    x,
    display = c("cp", "param", "granger", "density"),
    threshold = 0.1,
    layout = c("circle", "star", "nicely"),
    ...
)
```

plot_density

Arguments

| X | a VARDetect.result object |
|-----------|---|
| display | a character string, indicates the object the user wants to plot; possible values are |
| | "cp" input time series together with the estimated change points |
| | "param" estimated model parameters |
| | "granger" present the model parameters through Granger causal networks |
| | "density" plot the sparsity levels across all segments |
| threshold | a positive numeric value, indicates the threshold to present the entries in the sparse matrices |
| layout | a character string, indicating the layout of the Granger network |
| | not in use |

Value

A plot for change points or a series of plots for Granger causal networks for estimated model parameters

Examples

```
nob <- 1000
p <- 15
brk <- c(floor(nob / 3), floor(2 * nob / 3), nob + 1)
m <- length(brk)
q.t <- 1
try <- simu_var('sparse',nob=nob,k=p,lags=q.t,brk=brk,sp_pattern="off-diagonal",seed = 1)
data <- try$series
data <- as.matrix(data)
fit <- tbss(data, method = "sparse", q = q.t)
plot(fit, display = "cp")
plot(fit, display = "param")
plot(fit, display = "granger", threshold = 0.2, layout = "nicely")
plot(fit, display = "density", threshold = 0.2)</pre>
```

plot_density

Function to plot the sparsity levels for estimated model parameters

Description

A function to plot lineplot for sparsity levels of estimated model parameters

```
plot_density(est_mats, threshold = 0.1)
```

plot_granger 11

Arguments

est_mats A list of numeric matrices, the length of list equals to the number of estimated

segments

threshold A numeric value, set as a threshold, the function only counts the non-zeros with

absolute magnitudes larger than threshold

Value

A plot for sparsity density across over all estimated segments

Examples

```
set.seed(1)
est_mats <- list(matrix(rnorm(400, 0, 2), 20, 20), matrix(rnorm(400), 20, 20))
plot_density(est_mats, threshold = 0.25)</pre>
```

plot_granger

Function to plot Granger causality networks

Description

A function to plot Granger causal network for each segment via estimated sparse component. Note that if it has multiple lags, it only provides the first order Granger causality plot.

Usage

```
plot_granger(est_mats, threshold = 0.1, layout)
```

Arguments

est_mats A list of numeric sparse matrices, indicating the estimated sparse components

for each segment

threshold A numeric positive value, used to determine the threshold to present the edges

layout A character string, indicates the layout for the igraph plot argument

Value

A series of plots of Granger networks of VAR model parameters

```
set.seed(1)
est_mats <- list(matrix(rnorm(400, 0, 1), 20, 20))
plot_granger(est_mats, threshold = 2, layout = "circle")
plot_granger(est_mats, threshold = 2, layout = "star")
plot_granger(est_mats, threshold = 2, layout = "nicely")</pre>
```

print. VARDetect.result

plot_matrix

Plot the AR coefficient matrix

Description

Plot the AR coefficient matrix

Usage

```
plot_matrix(phi, p)
```

Arguments

phi combined coefficient matrices for all lags
p number of segments times number of lags

Value

a plot of AR coefficient matrix

Examples

print.VARDetect.result

Function to print the change points estimated by VARDetect

Description

Print the estimated change points of class VARDetect.result

```
## S3 method for class 'VARDetect.result' print(x, ...)
```

simu_lstsp 13

Arguments

```
x a VARDetect.result class object ... not in use
```

Value

Print the estimated change points

Examples

```
nob <- 1000
p <- 15
brk <- c(floor(nob / 3), floor(2 * nob / 3), nob + 1)
m <- length(brk)
q.t <- 1
try <- simu_var('sparse',nob=nob,k=p,lags=q.t,brk=brk,sp_pattern="off-diagonal",seed=1)
data <- try$series
data <- as.matrix(data)
fit <- tbss(data, method = "sparse", q = q.t)
print(fit)</pre>
```

simu_lstsp

Function to deploy simulation with LSTSP algorithm

Description

A function to generate simulation with LSTSP algorithm

```
simu_lstsp(
 nreps,
  simu_method = c("LS"),
  nob,
  k,
  lags = 1,
  lags_vector = NULL,
  brk,
  sigma,
  skip = 50,
  group_mats = NULL,
  group_type = c("columnwise", "rowwise"),
  group_index = NULL,
  sparse_mats = NULL,
  sp_density = NULL,
  signals = NULL,
  rank = NULL,
```

14 simu_lstsp

```
info_ratio = NULL,
  sp_pattern = c("off-diagonal", "diagoanl", "random"),
  singular_vals = NULL,
  spectral_radius = 0.9,
  alpha_L = 0.25,
  lambda.1 = NULL,
 mu.1 = NULL,
  lambda.1.seq = NULL,
 mu.1.seq = NULL,
 lambda.2,
 mu.2,
  lambda.3,
 mu.3,
  omega = NULL,
  h = NULL,
  step.size = NULL,
  tol = 1e-04,
  niter = 100,
  backtracking = TRUE,
  rolling.skip = 5,
  cv = FALSE,
 nfold = NULL,
  verbose = FALSE
)
```

Arguments

nreps A positive integer, indicating the number of simulation replications

simu_method the structure of time series: only available for "LS"

nob sample size

k dimension of transition matrixlags of VAR time series. Default is 1.

lags_vector a vector of lags of VAR time series for each segment brk a vector of break points with (nob+1) as the last element

sigma the variance matrix for error term

skip an argument to control the leading data points to obtain a stationary time series

group_mats transition matrix for group sparse case

group_type type for group lasso: "columnwise", "rowwise". Default is "columnwise".

group_index group index for group lasso.
sparse_mats transition matrix for sparse case

sp_density if we choose random pattern, we should provide the sparsity density for each

segment

signals manually setting signal for each segment (including sign)

rank if we choose method is low rank plus sparse, we need to provide the ranks for

each segment

simu_lstsp 15

info_ratio the information ratio leverages the signal strength from low rank and sparse components a choice of the pattern of sparse component: diagonal, 1-off diagonal, random, sp_pattern singular_vals singular values for the low rank components spectral_radius to ensure the time series is piecewise stationary. alpha_L a positive numeric value, indicating the restricted space of low rank component, default is 0.25 lambda.1 tuning parameter for sparse component for the first step mu.1 tuning parameter for low rank component for the first step lambda.1.seq a sequence of lambda to the left segment for cross-validation, it's not mandatory to provide mu.1.seq a sequence of mu to the left segment, low rank component tuning parameter lambda.2 tuning parameter for sparse for the second step mu.2 tuning parameter for low rank for the second step lambda.3 tuning parameter for estimating sparse components mu.3 tuning parameter for estimating low rank components omega tuning parameter for information criterion, the larger of omega, the fewer final selected change points window size of the first rolling window step h step.size rolling step tol tolerance for the convergence in the second screening step, indicates when to stop niter the number of iterations required for FISTA algorithm backtracking A boolean argument to indicate use backtrack to FISTA model rolling.skip The number of observations need to skip near the boundaries A boolean argument, indicates whether the user will apply cross validation to CV select tuning parameter, default is FALSE nfold An positive integer, the number of folds for cross validation verbose If is TRUE, then it will print all information about current step.

Value

A S3 object of class VARDetect.simu.result, containing the following entries:

sizes A 2-d numeric vector, indicating the size of time series data

true_lag True time lags for the process, here is fixed to be 1.

true_lagvector A vector recording the time lags for different segments, not available under this model setting, here is fixed to be NULL

true_cp True change points for simulation, a numeric vector

16 simu_tbss

true_sparse A list of numeric matrices, indicating the true sparse components for all segments
true_lowrank A list of numeric matrices, indicating the true low rank components for all segments
est_cps A list of estimated change points, including all replications
est_lag A numeric value, estimated time lags, which is user specified
est_lagvector A vector for estimated time lags, not available for this model, set as NULL.
est_sparse_mats A list of estimated sparse components for all replications
est_lowrank_mats A list of estimated low rank components for all replications
est_phi_mats A list of estimated model parameters, transition matrices for VAR model
running_times A numeric vector, containing all running times

Examples

```
nob <- 100
p <- 15
brk <- c(50, nob+1)
rank <- c(1, 3)
signals <- c(-0.7, 0.8)
singular_vals <- c(1, 0.75, 0.5)
info_ratio \leftarrow rep(0.35, 2)
lambda1 = lambda2 = lambda3 <- c(2.5, 2.5)
mu1 = mu2 = mu3 <- c(15, 15)
try_simu <- simu_lstsp(nreps = 3, simu_method = "LS", nob = nob, k = p,
                       brk = brk, sigma = diag(p), signals = signals,
                       rank = rank, singular_vals = singular_vals,
                       info_ratio = info_ratio, sp_pattern = "off-diagonal",
                       spectral_radius = 0.9, lambda.1 = lambda1, mu.1 = mu1,
                       lambda.2 = lambda2, mu.2 = mu2, lambda.3 = lambda3,
                       mu.3 = mu3, step.size = 5, niter = 20, rolling.skip = 5,
                       cv = FALSE, verbose = TRUE)
summary(try_simu, critical = 5)
```

simu_tbss

Simulation function for TBSS algorithm

Description

Function for deploying simulation using TBSS algorithm

```
simu_tbss(
  nreps,
  simu_method = c("sparse", "group sparse", "fLS"),
  nob,
  k,
```

 $simu_tbss$ 17

```
lags = 1,
  lags_vector = NULL,
 brk,
  sigma,
  skip = 50,
  group_mats = NULL,
 group_type = c("columnwise", "rowwise"),
 group_index = NULL,
  sparse_mats = NULL,
  sp_density = NULL,
  signals = NULL,
  rank = NULL,
  info_ratio = NULL,
  sp_pattern = c("off-diagonal", "diagoanl", "random"),
  singular_vals = NULL,
  spectral_radius = 0.9,
  est_method = c("sparse", "group sparse", "fLS"),
  q = 1,
  tol = 0.01,
  lambda.1.cv = NULL,
 lambda.2.cv = NULL,
 mu = NULL,
 group.index = NULL,
  group.case = c("columnwise", "rowwise"),
 max.iteration = 100,
 refit = FALSE,
 block.size = NULL,
 blocks = NULL,
 use.BIC = TRUE,
 an.grid = NULL,
 verbose = FALSE
)
```

Arguments

| nreps | A numeric integer number, indicates the number of simulation replications |
|-------------|---|
| simu_method | the structure of time series: "sparse", "group sparse", and "fLS" |
| nob | sample size |
| k | dimension of transition matrix |
| lags | lags of VAR time series. Default is 1. |
| lags_vector | a vector of lags of VAR time series for each segment |
| brk | a vector of break points with (nob+1) as the last element |
| sigma | the variance matrix for error term |
| skip | an argument to control the leading data points to obtain a stationary time series |
| group_mats | transition matrix for group sparse case |
| group_type | type for group lasso: "columnwise", "rowwise". Default is "columnwise". |

18 simu_tbss

group_index group index for group lasso. sparse_mats transition matrix for sparse case sp_density if we choose random pattern, we should provide the sparsity density for each segment signals manually setting signal for each segment (including sign) if we choose method is low rank plus sparse, we need to provide the ranks for rank each segment info_ratio the information ratio leverages the signal strength from low rank and sparse components a choice of the pattern of sparse component: diagonal, 1-off diagonal, random, sp_pattern singular_vals singular values for the low rank components spectral_radius to ensure the time series is piecewise stationary. est_method method: sparse, group sparse, and fixed low rank plus sparse. Default is sparse the AR order q tol tolerance for the fused lasso lambda.1.cv tuning parameter lambda_1 for fused lasso lambda.2.cv tuning parameter lambda_2 for fused lasso mu tuning parameter for low rank component, only available when method is set to "fLS" group.index group index for group sparse case group sparse pattern: column, row. group.case max number of iteration for the fused lasso max.iteration refit logical; if TRUE, refit the VAR model for parameter estimation. Default is FALSE. block.size the block size blocks the blocks use.BIC use BIC for k-means part an.grid a vector of an for grid searching

Value

verbose

A S3 object of class, named VARDetect.simu.result

is FALSE

est_cps A list of estimated change points, including all replications

est_sparse_mats A list of estimated sparse components for all replications

est_lowrank_mats A list of estimated low rank components for all replications

est_phi_mats A list of estimated model parameters, transition matrices for VAR model

a Boolean argument; if TRUE, function provides detailed information. Default

running_times A numeric vector, containing all running times

simu_var 19

Examples

simu_var

Generate VAR(p) model data with break points

Description

This function is used for generate simulated time series

```
simu_var(
 method = c("sparse", "group sparse", "fLS", "LS"),
 nob = 300,
 k = 20,
  lags = 1,
  lags_vector = NULL,
 brk,
  sigma = NULL,
  skip = 50,
  spectral_radius = 0.98,
  seed = NULL,
  sp_density = NULL,
  group_mats = NULL,
  group_index = NULL,
  group_type = c("columnwise", "rowwise"),
  sparse_mats = NULL,
  sp_pattern = c("off-diagonal", "diagonal", "random"),
  rank = NULL,
  info_ratio = NULL,
  signals = NULL,
  singular_vals = NULL
)
```

20 simu_var

Arguments

method the structure of time series: "sparse", "group sparse", "fLS", "LS"

nob sample size

k dimension of transition matrix

lags of VAR time series. Default is 1.

lags_vector a vector of lags of VAR time series for each segment

brk a vector of break points with (nob+1) as the last element

sigma the variance matrix for error term

skip an argument to control the leading data points to obtain a stationary time series

spectral_radius

to ensure the time series is piecewise stationary.

seed an argument to control the random seed. Default seed is 1.

sp_density if we choose random pattern, we should provide the sparsity density for each

segment

group_mats transition matrix for group sparse case

group_index group index for group lasso.

group_type type for group lasso: "columnwise", "rowwise". Default is "columnwise".

sparse_mats transition matrix for sparse case

sp_pattern a choice of the pattern of sparse component: diagonal, 1-off diagonal, random,

custom

rank if we choose method is low rank plus sparse, we need to provide the ranks for

each segment

info_ratio the information ratio leverages the signal strength from low rank and sparse

components

signals manually setting signal for each segment (including sign)

singular_vals singular values for the low rank components

Value

A list object, which contains the followings

series matrix of timeseries data

noises matrix of noise term data

sparse_mats list of sparse matrix in the transition matrix

lowrank_mats list of low-rank matrix in the transition matrix

Examples

summary.VARDetect.result

Function to summarize the change points estimated by VARDetect

Description

Summary method for objects of class VARDetect.result

Usage

```
## S3 method for class 'VARDetect.result'
summary(object, threshold = 0.1, ...)
```

Arguments

```
object a VARDetect.result object
threshold A numeric positive value, used to determine the threshold of nonzero entries
not in use
```

Value

A series of summary, including the estimated change points, running time

```
nob <- 1000
p <- 15
brk <- c(floor(nob / 3), floor(2 * nob / 3), nob + 1)
m <- length(brk)
q.t <- 1
try <- simu_var('sparse',nob=nob,k=p,lags=q.t,brk=brk,sp_pattern="off-diagonal",seed=1)
data <- try$series
data <- as.matrix(data)
fit <- tbss(data, method = "sparse", q = q.t)
summary(fit)</pre>
```

```
summary.VARDetect.simu.result
```

A function to summarize the results for simulation

Description

A function to summarize the results for simulation class VARDetect.simu.result

Usage

```
## S3 method for class 'VARDetect.simu.result'
summary(object, critical = 5, ...)
```

Arguments

```
object A S3 object of class VARDetect.simu.result

critical A positive integer, set as the critical value defined in selection rate, to control the range of success, default is 5

... not in use
```

Value

A series of summary, including the selection rate, Hausdorff distance, and statistical measurements, running times

tbss 23

tbss

Block segmentation scheme (BSS).

Description

Perform the block segmentation scheme (BSS) algorithm to detect the structural breaks in large scale high-dimensional non-stationary VAR models.

Usage

```
tbss(
  data,
 method = c("sparse", "group sparse", "fLS"),
 group.case = c("columnwise", "rowwise"),
 group.index = NULL,
  lambda.1.cv = NULL,
  lambda.2.cv = NULL,
 mu = NULL,
 q = 1,
 max.iteration = 50,
  tol = 10^{(-2)},
 block.size = NULL,
 blocks = NULL,
  refit = FALSE,
 use.BIC = TRUE,
 an.grid = NULL,
  verbose = FALSE
)
```

Arguments

| data | input data matrix, with each column representing the time series component |
|---------------|---|
| method | method: sparse, group sparse, and fixed low rank plus sparse. Default is sparse |
| group.case | group sparse pattern: column, row. |
| group.index | group index for group sparse case |
| lambda.1.cv | tuning parameter lambda_1 for fused lasso |
| lambda.2.cv | tuning parameter lambda_2 for fused lasso |
| mu | tuning parameter for low rank component, only available when method is set to "fLS" |
| q | the VAR lag |
| max.iteration | max number of iteration for the Fused lasso |
| tol | tolerance for the fused lasso |
| block.size | the block size |
| blocks | the blocks |

24 tbss

| refit | logical; if TRUE, refit the VAR model for parameter estimation. Default is FALSE. |
|---------|--|
| use.BIC | use BIC for k-means part |
| an.grid | a vector of an for grid searching |
| verbose | a Boolean argument to determine whether provide detailed outputs for each step. Default is FALSE |

Value

S3 object of class VARDetect.result, which contains the followings

data the original dataset

q the time lag user specified, a numeric value

cp final estimated change points, a numeric vector

sparse_mats estimated sparse components for each segment, a list of numeric matrices

lowrank_mats estimated low rank components for each segment, a list of numeric matrices

est_phi estimated final model parameters, the summation of the sparse and the low rank components

time computation time for each step

```
#### sparse VAR model
nob <- (10<sup>3</sup>) # number of time points
p <- 15; # number of time series components
brk <- c(floor(nob/3),floor(2*nob/3),nob+1); # true break points with nob+1 as the last element
m0 <- length(brk) -1; # number of break points
q.t <- 1; # the true AR order
m <- m0+1 #number of segments
try<-simu_var('sparse',nob=nob,k=p,lags=q.t,brk = brk,sp_pattern="off-diagonal",seed=1)
data <- try$series
data <- as.matrix(data)</pre>
#run the bss method
fit <- tbss(data, method = "sparse", q = q.t)</pre>
print(fit)
summary(fit)
plot(fit, data, display = "cp")
plot(fit, data, display = "param")
###### Example for fixed low rank plus sparse structure VAR model
nob <- 300
p <- 15
brk <- c(floor(nob/3), floor(2*nob/3), nob+1)</pre>
m <- length(brk)
q.t <- 1
signals <- c(-0.7, 0.7, -0.7)
rank <- c(2, 2, 2)
singular_vals <- c(1, 0.75)
```

weekly 25

weekly

weekly stock price data

Description

weekly stock price data

Usage

data(weekly)

Format

An dataframe of weekly stock price data

```
data(weekly)
head(weekly)
```

Index

```
\ast datasets
