Type Package

Title Univariate Bootstrapping and Other Things

Version 0.1.5
Author Patrick O'Keefe
Maintainer Patrick O'Keefe <okeefep@ohsu.edu></okeefep@ohsu.edu>
<b>Description</b> Primarily devoted to implementing the Univariate Bootstrap (as well as the Traditional Bootstrap). In addition there are multiple functions for DeFries-Fulker behavioral genetics models. The univariate bootstrapping functions, DeFries-Fulker functions, regression and traditional bootstrapping functions form the original core. Additional features may come online later, however this software is a work in progress. For more information about univariate bootstrapping see: Lee and Rodgers (1998) and Beasley et al (2007) <doi:10.1037 1082-989x.12.4.414="">.</doi:10.1037>

<u>*</u>			 	 	
		bootsample	 	 	

# Description

Title

# Usage

aboot(boot)

aCalc 3

#### **Arguments**

boot

a vector of bootstrap resample statistics to use to calculate the accelleration parameter.

#### Value

a vector of accelleration parameters for use in BCa bootstrap intervals

# **Examples**

```
data<-DFSimulated()
boots<-NaiveBoot(data, groups="Rs", keepgroups=TRUE)
boots<-bootAnalysis(boots, cbind, DFanalysis, 1,2,3, robust=FALSE)
boots<-t(boots)
aboot(boots)</pre>
```

aCalc

aCalc

# Description

This function calculates the actual "a" estimate from the jackknife approximation of a used in BCa CI's

#### Usage

aCalc(X)

# Arguments

Χ

A vector of jackknife results

#### Value

An estimate of a for use in BCa.

```
X<-rchisq(100,2)
aCalc(X)</pre>
```

4 ajack

add

# Description

add

# Usage

add(x)

# Arguments

Χ

a list to be summed. Useful for doing elementwise summation of a list of matrices.

#### Value

returns a single summed object (e.g., a matrix)

# **Examples**

```
x<-list(matrix(c(1:4),nrow=2),matrix(c(1:4),nrow=2)) add(x)
```

add

ajack

ajack

# Description

ajack

# Usage

```
ajack(data, FUN, ...)
```

# Arguments

data data to get the bias parameter (a) for FUN a function to be applied to the data ... additional arguments passed to FUN

# Value

a vector of accelleration parameters for use in BCa bootstrap intervals

AllBootResults 5

#### **Examples**

```
data<-DFSimulated()
ajack(data,DFanalysis, betasonly=TRUE, robust=FALSE)</pre>
```

AllBootResults

AllBootResults

#### **Description**

AllBootResults

#### Usage

```
AllBootResults(boot, lower = 0.025, upper = 0.975, data, FUN, ...)
```

# Arguments

boot	A matrix of bootstrap results
lower	the lower alpha
upper	the upper alpha
data	the data used for analysis
FUN	the function used for analysis
	additional arguments to pass to FUN

#### Value

a matrix of results. Includes the baseline results, all output from standardBootIntervals, all results from BCa for both the jackknife and bootstrap accelleration methods. The bootstrap accelleration method is experimental.

```
data<-DFSimulated()
boots<-NaiveBoot(data, groups="Rs", keepgroups=TRUE)
boots<-bootAnalysis(boots, cbind, DFanalysis, 1,2,3, robust=FALSE)
AllBootResults(boots, .025,.975, data, DFanalysis, 1,2,3, robust=FALSE)</pre>
```

6 BCa

 ${\tt BarebonesBetas}$ 

BarebonesBetas

# Description

Gives just the beta weights from a linear model.

#### Usage

```
BarebonesBetas(data, Y = NULL, RHS = NULL)
```

#### **Arguments**

data Data to be analyzed. Dependent variable MUST BE THE FIRST VARIABLE.

Y optional. The dependent variable

RHS option. The right hand side of the model, in R's model formulation (i.e., ~

X1+X2+etc

# Value

A vector of beta coefficients

# **Examples**

```
Data<-TestData()
BarebonesBetas(Data)</pre>
```

BCa

BCa

# Description

BCa

# Usage

```
BCa(
  boot,
  data,
  alphalower = 0.025,
  alphaupper = 0.975,
  accelleration = "jack",
  FUN,
  ...
)
```

bias 7

#### **Arguments**

boot A vector of bootstrap estimates of Theta
data The data that was analyzed via the bootstrap

alphalower The lower alpha for CI creation alphaupper The upper alpha for CI creation

accelleration can currently take two values, "jack" and "bootstrap". "jack" returns the jack-

knife estimate of the accelleration parameter. "boot" is an experimental function that uses the bootstrap estimates in the calculation of the accelleration parameter. "boot" is many times faster (approximately n times faster where n is the

number of observations).

FUN The function used to get estimates of Theta

... Additional arguments to FUN

#### Value

A matrix of BCa bootstrap CI's, the bias parameter and the accellation parameter

#### **Examples**

```
data<-DFSimulated()
boot<-NaiveBoot(data, groups="Rs", keepgroups=TRUE)
boot<-bootAnalysis(boot, cbind, DFanalysis, 1,2,3, robust=FALSE)
BCa(boot, data, .025,.975, accelleration="bootstrap", DFanalysis, 1,2,3, robust=FALSE)</pre>
```

bias Title

# Description

Title

#### Usage

bias(boot, theta)

#### **Arguments**

boot A vector of bootstrap estimates of theta

theta the sample estimate of theta

#### Value

z0 the bias parameter for BCa CI

8 bootAnalysis

#### **Examples**

```
X<-data.frame(rnorm(1000))
theta<-mean(X)
boot<-NaiveBoot(X)
boot<-lapply(boot, mean)
boot<-do.call(rbind, boot)
bias(boot, theta)</pre>
```

bootAnalysis

bootAnalysis

# Description

bootAnalysis

#### Usage

```
bootAnalysis(boot, collapse = cbind, FUN, ...)
```

#### **Arguments**

boot A list of bootstrap resamples from NaiveBoot or uniboot.

collapse Should the results be collapsed from list form. Can take values of NULL, cbind

or rbind

FUN The function to apply to the bootstrap resamples

... additional arguments to be passed to FUN

#### Value

A list or matrix of results

```
data<-DFSimulated()
data<-doubleEnter(data[,1],data[,2],data[,3])
boots<-uniboot(data, 1000, "Rs", TRUE, .5, NULL)
results<-bootAnalysis(boots, cbind, FUN=DFanalysis, 1,2,3,TRUE,FALSE,TRUE,FALSE)</pre>
```

bootsample 9

bootsample

bootsample

# Description

boots ample

# Usage

```
bootsample(data, size = 1)
```

# Arguments

data

a dataset to be bootstrapped

size

the size of the bootstrap sample relative to the original sample

#### Value

a dataset

# **Examples**

```
X<-TestData()
Y<-bootsample(X)</pre>
```

cent

cent

# Description

cent

# Usage

cent(X)

# Arguments

Χ

vector to be centered

# Value

Returns a centered vector

```
X<-c(1:10)
cent(X)</pre>
```

10 cholcors

centerData

centerData

# Description

centerData

#### Usage

```
centerData(data)
```

# Arguments

data

The data to be centered

#### Value

The centered data

# **Examples**

```
X<-data.frame(X=c(1:4),Y=c(6:9))
centerData(X)</pre>
```

cholcors

cholcors

# Description

cholcors

#### Usage

```
cholcors(X, use = "everything")
```

# Arguments

X A matrix of data.

use the missing data type to use for the correlation. Default is R's default "every-

thing".

#### Value

This function returns the cholesky decomposition of the correlation matrix of the data

cholcovs 11

#### **Examples**

```
X<-stats::rnorm(100)
Y<-stats::rnorm(100)+X
Z<-cbind(X,Y)
cholcors(Z)</pre>
```

cholcovs

cholcovs

#### **Description**

cholcovs

#### Usage

```
cholcovs(X, use = "everything")
```

#### **Arguments**

X A matrix of data.

use the missing data type to use for the correlation. Default is R's default "every-

thing".

#### Value

This function returns the cholesky decomposition of the correlation matrix of the data

# **Examples**

```
X<-stats::rnorm(100)
Y<-stats::rnorm(100)+X
Z<-cbind(X,Y)
cholcovs(Z)</pre>
```

DFanalysis

**DFanalysis** 

# Description

There are three possible models to be fit. The default is the Rodgers and Kohler formulation of the DF model (Rodgers & Kohler, 2005). The non-default (if RK=F), is to fit the original DeFries-Fulker model. The third option is only used when dominance coefficients are provided, and is based on the formulation by Waller (Waller 1994).

12 DFanalysis

#### Usage

```
DFanalysis(
  data = NULL,
  proband,
  sibling,
  Rs,
  Ds = NULL,
  RK = T,
  robust = T,
  DE = T,
  betasonly = F,
  typicalSE = F
```

#### Arguments

data A dataframe. This is not necessary as the variables can be passed directly via

the other arguments.

proband Called "proband" for historical reasons this is the variable on the left hand side

of the regression.

sibling The right hand side version of proband. This would be the matched sibling

scores.

Rs This is the vector of relatedness coefficients

Ds A vector of dominance coefficients. 1 for MZ twins, .25 for DZ twins and full

siblings. The default is null, and no value should be provided if using the ACE model. This should only have a non-null value when fitting an ADE model. There is an RK version of this model, however it is not based on published work. The RK version uses double entered (and mean centered) data in order to drop the intercept term and the extraneous regression coefficient (both of which can be constrained to 0 when the phenotypic mean is 0). Initial simulations suggest that this formulation provides accurate parameter estimates, however the original formulation can be used by simply setting RK=F. It is assumed that, if RK=T, that DE=T (i.e., do NOT double enter data prior to analysis if using

the ADE model).

RK Use the Rodgers and Kohler simplified version of the DF model (recommended).

Data should not be double entered prior to analysis.

robust Use the Kohler and Rodgers robust standard errors (recommended when using

double entered data)

DE Will the data need to be double entered?

betasonly If TRUE only the beta weights from the regression analysis will be returned.

typicalSE Should the typical regression standard errors be used? Default is false.

#### Value

The results from MyLM

DFSimulated 13

#### **Examples**

```
TwinData<-DFSimulated(2000,2000,.3,.3)
p<-TwinData[,1]
s<-TwinData[,2]
r<-TwinData[,3]
DFanalysis(data=NULL, p,s,r)</pre>
```

DFSimulated

DFSimulated

# Description

**DFSimulated** 

# Usage

```
DFSimulated(MZ = 250, DZ = 250, a2 = 0.3, c2 = 0.3)
```

# Arguments

MZ	Number of MZ twins to simulate
DZ	Number of DZ twins to simulate
a2	Heritability (proportion of variance)
c2	Shared environment (proportion of variance)

#### Value

A dataframe

#### **Examples**

```
TwinData<-DFSimulated(200,200,.3,.3)</pre>
```

DFSimulatedChisq

DFSimulatedChisq

# Description

DFSimulatedChisq

# Usage

```
DFSimulatedChisq(MZ = 250, DZ = 250, a2 = 0.3, c2 = 0.3, df = 10)
```

#### **Arguments**

MZ	Number of MZ twins to simulate
DZ	Number of DZ twins to simulate
a2	Heritability (proportion of variance)
c2	Shared environment (proportion of variance)
df	Total degrees of freedom for the Chi-Square variable

#### Value

A dataframe of Chi-Square distributed outcome observations for MZ and DZ twins

#### **Examples**

```
TwinData<-DFSimulatedChisq(200,200,.3,.3, 10)</pre>
```

 $DFS imulated Chisq New \\ DFS imulated Chisq New \\$ 

# Description

DFSimulatedChisqNew

# Usage

```
DFSimulatedChisqNew(MZ = 250, DZ = 250, a2 = 0.3, c2 = 0.3, df = 5)
```

#### **Arguments**

MZ	Number of MZ twins to simulate
DZ	Number of DZ twins to simulate
a2	Heritability (proportion of variance)
c2	Shared environment (proportion of variance)
df	Total degrees of freedom for the Chi-Square variable

#### Value

A dataframe of Chi-Square distributed outcome observations for MZ and DZ twins

```
TwinData<-DFSimulatedChisqNew(200,200,.3,.3, 10)</pre>
```

doubleEnter 15

doubleEnter	DoubleEnter 1 6 1
-------------	-------------------

# Description

DoubleEnter

# Usage

```
doubleEnter(proband, sibling, Rs)
```

# Arguments

proband The proband scores

sibling The matched sibling scores
Rs The relatedness coefficients

#### Value

A dataframe

# **Examples**

```
X<-DFSimulated(10,10,.2,.2)
Y<-doubleEnter(X[,"proband"], X[,"sibling"], X[,"Rs"])</pre>
```

findSa findSa

# Description

This is an implementation of the YHY bootstrap covariance matrix.

# Usage

```
findSa(S, fitted, p, a = 0.5, df, n, tau = NULL, tol = 1e-07)
```

# Arguments

S	Sample covariance matrix
fitted	The fitted covariance matrix
р	the number of columns in the covariance matrix
a	the starting value for the a parameter
df	the degrees of freedom in the model

Group\_function

n	the number of participants in the model
tau	the population tau. If no tau is provided, the estimated tau from the model will be used
tol	the difference between ga and tau at which the function will converge

#### Value

a list of the "a" adjusted covariance matrix, Sa, the tau, ga, and the number of interations.

#### **Examples**

```
require(Omisc)
require(lavaan)
set.seed(2^7-1)
modelTest<-'
LV1=^{-}.7*x1+.8*x2+.75*x3+.6*x4
LV2=~ .7*y1+.8*y2+.75*y3+.6*y4
LV1~~.3*LV2
LV1~~1*LV1
LV2~~1*LV2
modelFit<-'
LV1=~x1+x2+x3+x4
LV2=~ y1+y2+y3+y4
LV1~~start(.5)*LV2
LV1~~1*LV1
LV2~~1*LV2
testdata<-simulateData(modelTest, sample.nobs = 250)</pre>
fit<-cfa(modelFit, testdata)</pre>
fitted<-fitted(fit)$cov</pre>
fitted<-fitted[,1:ncol(fitted)]</pre>
S<-cov(testdata)</pre>
p<-8
a<-.5
n<-250
df<-21
findSa(S, fitted, p, .5, df, n)
```

 ${\tt Group\_function}$ 

Grouping\_function

#### **Description**

originally from the ParallelTree package. If data argument is Null, takes a variable "x" and a matrix or dataframe of level identifiers (e.g., mother and then child IDs). Level variables should be included in order from highest level to the lowest. Listwise deletes missing data. Otherwise grabs variables from entered dataframe Group\_function

17 Group\_function

#### Usage

```
Group_function(
  data = NULL,
  х.
  levels,
  func = mean,
  center = FALSE,
  nested = TRUE,
  append = FALSE,
  funcName = "Mean"
)
```

#### **Arguments**

a data frame with the x and level variables included. Default is NULL. data

If data = NULL a dataframe of scores to have the function applied to. If data != Х

NULL, a vector of string(s) naming the variable(s) in data to use.

levels If data = NULL, a dataframe of grouping variables. If data != NULL, a vector

> of strings naming the variables in data to use. levels should be ordered from the highest level to the lowest. Group and case identifiers should be unique, if they

are not unique, cases with non-unique identifiers will be grouped together.

func A function to apply at each group. Default is mean.

center If set to true variables will be group/person mean centered. Note that the grand

mean remains unchanged by this operation. If this output is to be passed directly

to Parallel\_Tree the grand mean should be set to 0.

nested Are level variables nested? Default is TRUE. If set to FALSE means will be

> calculated for level variable independently. FALSE may be useful in cases of crossed designs. Note that if data are nested but all identifiers are unique both within and across groups nested = FALSE and nested = TRUE will return the

same result.

If set to true, the original data will be returned along with all created variables. append

Provides way to name function used. This is used when creating names for funcName

created variables. Default is "Mean".

#### Value

This function returns a dataframe with variables labeled according to the level at which the function was applied. Assumed function is mean, and all variables are labeled accordingly. If an alternative function is used labels should be manually changed to reflect function used.

```
#the ChickWeight data is from base R
#nested is set to false because Chick and Time are crossed
Means_Chick<-Group_function(data=ChickWeight,x="weight", levels =c("Diet","Chick","Time"),
nested = FALSE, append=TRUE)
```

18 jackknife

HoffPseudoStandard

HoffPseudoStandard

# Description

HoffPseudoStandard

# Usage

```
HoffPseudoStandard(betas, SDX, interceptvar)
```

#### **Arguments**

betas A vector of betas from a multilevel model

SDX A vector of the standard deviations of the X value for each of the X's associated

with the bets

interceptvar A vector of the intercept variances at the level associated with the betas

#### Value

A vector of pseudostandardized coefficients

# **Examples**

```
print("none")
```

jackknife

jackknife

# Description

jackknife

#### Usage

jackknife(data)

# Arguments

data

The data to jackknife

#### Value

a list of jackknife datasets

justBetas 19

# **Examples**

```
data<-cbind(1:10,1:10)
result<-jackknife(data)
lapply(result,mean)</pre>
```

justBetas

*justBetas* 

#### **Description**

justBetas

# Usage

```
justBetas(data, Y, X)
```

# Arguments

A data frame

Y The name or column number of the Y variable

X The name(s) or column number(s) of the X variables

#### Value

A vector of unstandardized beta weights

```
X<-stats::rnorm(100)
Y<-stats::rnorm(100)+5*(X)
data<-cbind(Y,X)
justBetas(data,1,2)
#if you want an intercept
Y<-stats::rnorm(100)+5*(X)+5
data<-cbind(Y,X,1)
justBetas(data,1,c(2:3))</pre>
```

20 leave1out

#### **Description**

lbind is meant to be used in conjuction with lapply to combine elements of lists using rbind.

# Usage

```
lbind(index, alist, n)
```

#### **Arguments**

a list of indexes. This should count the number of items to return in the final list
 a list of objects to be passed to rbind. They should be grouped according to which objects will be combined (e.g., if 1,2,3 are to be passed to cbind then they should be adjacent to eachother).
 n The number of objects in each group. Currently each group must consist of the

same number of objects. Currently each group must consist of the

#### Value

a list

#### **Examples**

```
alist<-list(c(1,1),c(2,2),c(3,3))
index<-list(1)
n<-3
lapply(index,lbind,alist,3)</pre>
```

leave1out

leave1out

# Description

leave1out

# Usage

```
leave1out(x, data)
```

#### **Arguments**

x Which row(s) of data to leave out

data A dataframe or matrix.

MyLM 21

# Value

The reduced dataframe or matrix

# **Examples**

```
data<-cbind(1:10,1:10)
leave1out(5,data)</pre>
```

MyLM MyLM

# Description

MyLM

# Usage

```
MyLM(Y, X, robust = F, betasonly = F, typicalSE = T)
```

# Arguments

Υ	The Y variable
X	A matrix of X variables
robust	Should robust standard errors be calculated? Assumes a double entered twin dataset with twins evenly spaced in the dataset.
betasonly	Should only the betas be returned? Good for bootstrapping
typicalSE	Should the typical standard errors be included? Default is true. Can be true when robust is True.

#### Value

Returns a matrix of betas and standard errors

```
X<-DFSimulated(100,100,.4,.4)
Y<-RK(X[,1],X[,2],X[,3])
MyLM(Y[,1],Y[,c(2:3)],TRUE)</pre>
```

22 NaiveBoot\_dep

NaiveBoot The Naive Bootstrap

#### **Description**

The Naive Bootstrap

#### Usage

```
NaiveBoot(data, B = 1000, groups = NULL, keepgroups = F, size = 1)
```

#### **Arguments**

data to be bootstrapped

B number of bootstrap samples to take groups grouping variable if there is one keepgroups keep the grouping variable?

size size of the bootstrap resamples relative to the original sample

#### Value

a list of bootstrap resamples

#### **Examples**

```
X<-TestData()
Y<-NaiveBoot(X)</pre>
```

NaiveBoot\_dep

The Naive Bootstrap

#### **Description**

The Naive Bootstrap

# Usage

```
NaiveBoot_dep(data, B = 1000, groups = NULL, keepgroups = F, size = 1)
```

# Arguments

data data to be bootstrapped

B number of bootstrap samples to take groups grouping variable if there is one keepgroups keep the grouping variable?

size size of the bootstrap resamples relative to the original sample

resample 23

# Value

a list of bootstrap resamples

# **Examples**

```
X<-TestData()
Y<-NaiveBoot(X)</pre>
```

resample

resample

# Description

resample

# Usage

```
resample(X, size)
```

# Arguments

X A vector to be resamples

size The size of the resulting vector. Should be a number such that size\*nrow(X) is

a whole number

#### Value

A vector of resampled X values

# **Examples**

```
X<-c(1:10)
resample(X,.5)</pre>
```

RK

RK

# Description

RK

# Usage

```
RK(proband, sibling, Rs, DE = T)
```

24 Sfunc

# Arguments

proband column name or number of the proband sibling column name or number of the siblings

Rs column name or number of the relatedness coefficients

DE Should the data be double entered?

# Value

A dataframe

# **Examples**

```
X<-DFSimulated(100,100,.3,.3)
Y<-RK(X[,1],X[,2],X[,3])</pre>
```

Sfunc

# Description

function for calculating the matrices for the Kohler Rodgers SE

**Sfunc** 

#### Usage

```
Sfunc(X, e)
```

#### **Arguments**

X A matrix of X variables
e A matrix of error terms

# Value

A matrix

```
print("Nah")
```

standardBootIntervals 25

standardBootIntervals

#### **Description**

This returns the quantiles of the bootstrap samples specified by the user. The quantiles uses the type=4 argument of the quantile function, which appears to function best.

#### Usage

```
standardBootIntervals(boot, lower = 0.025, upper = 0.975)
```

#### Arguments

boot A vector of bootstrap results

lower the lower alpha upper the upper alpha

#### Value

A matrix of the mean, median, min, max, lower and upper CI values

#### **Examples**

```
data<-DFSimulated()
boots<-NaiveBoot(data, groups="Rs", keepgroups=TRUE, B=100)
boots<-bootAnalysis(boots, cbind, DFanalysis,1,2,3,TRUE,FALSE,TRUE,TRUE,FALSE)
apply(boots,1, standardBootIntervals)
DFanalysis(data,1,2,3)</pre>
```

TestData TestData

# Description

Simple function for creating a dataset of two related variables.

#### Usage

```
TestData(nobs = 1000, intercept = 0, beta = 5, meanX = 0, sdX = 1, sdYerr = 1)
```

26 uniboot

#### Arguments

nobs
Number of observations, defaults to 1000
intercept
Intercept of the regression. Defaults to 0
beta
Beta for the regression equation, defaults to 5
meanX
Mean of X, defaults to 0
sdX
Standard deviation of X, defaults to 1
sdYerr
Variance of the error term of Y, defaults to 1

#### Value

A dataframe with an X and Y variable produced by the entered parameters

#### **Examples**

```
X<-TestData()
```

uniboot

Univariate Bootstrap

#### **Description**

WARNING: This function can't be used with data that is already fed through the RK function. The correlation matrix will not be positive definite.

#### Usage

```
uniboot(
  data,
  B = 1000,
  groups = NULL,
  keepgroups = F,
  size = 1,
  HIcor = NULL,
  samplefrom = "group",
  use = "everything",
  standardized = T
)
```

#### **Arguments**

data The data frame to be resampled

B The number of bootstrap samples.

groups A grouping variable name

keepgroups Should the grouping variable be kept in the final datasets?

unibootsample 27

size The size of the bootstrap sample to be returned. Should be as a proportion and

must be evenly divided into nrow(data).

HICOr If a hypothesis imposed correlation matrix is to be used, this argument takes a

list of hypothesized correlation matrices. IT MUST BE A LIST OF ONE OR MORE MATRICES. Multiple matrices can be entered in the case of grouped data (one for each group). If the nil-null correlation is to be used an identity matrix can be entered here (the same size as the appropriate correlation matrix).

samplefrom Takes one of either "group" or "whole". When doing bootstrapping of grouped

data this tells uniboot if the whole sample should be used as the sampling frame for each group (whole), or not (group). "group" should be used unless it is believed that all groups share the same underlying marginal distribution for each variable (e.g., the same mean and variance in the case of normally distributed

data).

use The missing data method for cor. Default is R's default "everything".

standardized should the resampled data be standardized? The default is TRUE. This is com-

putationally more efficient (the data are standardized as a step during the diago-

nalization procedure).

#### Value

A list of bootstrap samples

#### **Examples**

data<-TestData()
X<-uniboot(data,1000)</pre>

unibootsample

unibootsample

#### **Description**

unibootsample

#### Usage

unibootsample(data, size)

#### Arguments

data A dataframe or matrix to be univariately bootstrapped

size size of each bootstrap sample as a fraction of the total sample size. Total sample

size must be evenly divisible by "size".

#### Value

A matrix or dataframe with nrow=nrow(X)\*size

28 uniboot\_dep

#### **Examples**

```
X<-c(0:9)
Y<-c(20:29)
Z<-cbind(X,Y)
unibootsample(Z,1)</pre>
```

unibootVar

unibootVar

# **Description**

unibootVar

# Usage

```
unibootVar(X, times)
```

#### **Arguments**

X The variable

times The number of times the variable is repeated in the univariate sampling frame.

This is going to be equal to the number of variables being univariately sampled

#### Value

The variance of the variable in the univariate sampling frame

# **Examples**

```
X<-c(1,2)
times<-100
unibootVar(X,times)
var(X)</pre>
```

uniboot\_dep

Univariate Bootstrap

# Description

WARNING: This function can't be used with data that is already fed through the RK function. The correlation matrix will not be positive definite.

uniboot\_dep 29

#### Usage

```
uniboot_dep(
  data,
  B = 1000,
  groups = NULL,
  keepgroups = F,
  size = 1,
  HIcor = NULL,
  samplefrom = "group",
  use = "everything"
)
```

#### Arguments

data The data frame to be resampled

B The number of bootstrap samples. Alternatively "sampleframe" which will re-

turn the univariate sampling frame. "samplefrom" is not advised when there are many observations and/or many variables as the returned dataframe will be quite

large.

groups A grouping variable name

keepgroups Should the grouping variable be kept in the final datasets?

size The size of the bootstrap sample to be returned. Should be as a proportion and

must be evenly divided into nrow(data).

HIcor If a hypothesis imposed correlation matrix is to be used, this argument takes a

list of hypothesized correlation matrices. IT MUST BE A LIST OF ONE OR MORE MATRICES. Multiple matrices can be entered in the case of grouped data (one for each group). If the nil-null correlation is to be used an identity matrix can be entered here (the same size as the appropriate correlation matrix).

samplefrom Takes one of either "group" or "whole". When doing bootstrapping of grouped

data this tells uniboot if the whole sample should be used as the sampling frame for each group (whole), or not (group). "group" should be used unless it is believed that all groups share the same underlying marginal distribution for each variable (e.g., the same mean and variance in the case of normally distributed

data).

The missing data method for cor. Default is R's default "everything".

#### Value

A list of bootstrap samples

```
data<-TestData()
X<-uniboot(data,1000)</pre>
```

30 zScoreData

zScore

Title

# Description

Title

#### Usage

```
zScore(X, reps = 1)
```

# Arguments

Χ

The vector to be turned into z scores

reps

The number of reps the vector is to be repeated. This will only be used in

univariate bootstrapping. The default is 1.

# Value

A vector of z scores.

# **Examples**

```
X<-c(1:10)
zScore(X)</pre>
```

zScoreData

centerData

# Description

centerData

# Usage

zScoreData(data)

# Arguments

data

The data to be converted to z scores

#### Value

Data converted to z scores

```
X<-data.frame(X=c(1:4),Y=c(6:9))
zScoreData(X)</pre>
```
