Package 'Rcan'

September 25, 2024

Version 1.3.91

Title Cancer Registry Data Analysis and Visualisation

Date 2024-09-17

Author Mathieu Laversanne [aut, cre],
Jerome Vignat [aut],
Cancer Surveillance Unit [cph]

Maintainer Mathieu Laversanne <laversannem@iarc.who.int>

Depends R (>= 3.5)

Description Tools for basic and advance cancer statistics and graphics.
Groups individual data, merges registry data and population data, calculates age-
specific rate, age-standardized rate, cumulative risk, estimated annual percentage rate with stan-
dards error. Creates graphics across variable and
time, such as age-specific trends, bar chart and period-cohort trends.

License GPL (>= 2)

LazyLoad yes

Imports data.table, stats, ggplot2, grid, scales, grDevices, graphics,
utils

Suggests testthat

RoxygenNote 7.3.2

Contents

Rcan-package   *Cancer Registry Data Analysis and Visualisation*

Description

Tools for basic and advance cancer statistics and graphics. Groups individual data, merges registry data and population data, calculates age-specific rate, age-standardized rate, cumulative risk, estimated annual percentage rate with standards error. Creates graphics across variable and time, such as age-specific trends, bar chart and period-cohort trends.

group_by="registry_label",
legend=csu_trend_legend(position="bottom", nrow = 2),
plot_title = "Liver, male",
CI5_comparison = 16)
```

---

csu_ageSpecific   *csu_ageSpecific*

Description

csu_ageSpecific calculate and plot Age-Specific Rate.

Usage

```
csu_ageSpecific(df_data,
var_age="age",
        var_cases="cases",
        var_py="py",
        group_by = NULL,
        missing_age = NULL,
        db_rate = 100000,
```

```
logscale=FALSE,
        plot_title=NULL,
        legend=csu_trend_legend(),
        color_trend = NULL,
        CI5_comparison=NULL,
        var_rate="rate")
```

Arguments

df_data	Data (need to be R data.frame format, see example to import csv file).
var_age	Age variable. Several format are accepted

1	"0-4"	0
2	"5-9"	5
3	"10-14"	10
...	...	...
17	"80-84"	80
18	"85+"	85

Missing age value must be precise in the option missing_age.
Last age group will always be considere without size (ie: 80+,85+, etc..).

var_cases	Number of event (cases, deaths, ...) variable.
var_py	Population year variable.
group_by	Variable to compare different age specific rate (sex, country, cancer ...). Only one variable can be chosen.
missing_age	Age value representing the missing age cases.
db_rate	The denominator population. Default is 100000.
logscale	Logical value: if TRUE Y-axis use logscale.
plot_title	Title of the plot.
legend	Legend option: see [csu_trend_legend](#). Use only if group_by is not NULL.
color_trend	Vector of color for the trend. The color codes are hexadecimal (e.g. "#FF0000") or predefined R color names (e.g. "red").
CI5_comparison	Add a dotted line representing the CI5XII for a specific cancer. Value can be a cancer_label (example: "Liver"), or a cancer_code (example = 16). See [csu_ci5_mean](#) to get the list of possible values.
var_rate	Name of the age specific variable if a dataframe is return.

Details

This function calculate and plot the age specific rate. The group_by option allow to compare different population or cancer. The CI5_comparison option allow to compare with the CI5XII and therefore test the quality of the data. If the population data stops before 85+ (75+ for instance), the population data **must** be 0 when the population data is unknown so, the program can detect automatically the last age group (70+,75+,80+ or 85+) for population.

Value

Return a plot and a data.frame.

```

---

csu_ageSpecific_top   *csu_ageSpecific_top*

Description

csu_ageSpecific_top calculate and plot Age-Specific Rate for the top X cancer or top X population.

Usage

```
csu_ageSpecific_top(df_data,
            var_age="age",
            var_cases="cases",
            var_py="py",
            var_top,
            group_by=NULL,
            missing_age=NULL,
            db_rate = 100000,
            logscale = FALSE,
            nb_top = 5,
            plot_title=NULL,
            plot_subtitle=NULL,
            var_color=NULL)
```

Arguments

df_data	Data (need to be R `data.frame` format, see example to import csv file).
var_age	Age variable. Several format are accepted

1	"0-4"	0
2	"5-9"	5
3	"10-14"	10
...	...	...
17	"80-84"	80
18	"85+"	85

	Missing age value must be precise in the option `missing_age`. Last age group will always be considere without size (ie: 80+,85+, etc..).
var_cases	Number of event (cases, deaths, ...) variable.
var_py	Population year variable.
var_top	Cancer label variable or country/registry variable for example.
group_by	Variable to compare different age specific rate (sex, registry ...). Only one variable can be chosen. One graph will be produce per variable. If the variable is a factor, the labels associate to the variable will be the subtitle of the plot. See [factor]().
missing_age	Age value representing the missing age cases.
db_rate	The denominator population. Default is 100000.
logscale	Logical value: if TRUE Y-axis use logscale.
nb_top	Lowest Rank include. Default is 5.
plot_title	Title of the plot.
plot_subtitle	Subtitle of the plot. (For example, "Top 5 cancer").
var_color	Variable with a color associate to each cancer. The color codes are hexadecimal (e.g. "#FF0000") or predefined R color names (e.g. "red"). This allow to keep the same color coding for each graph.

Details

This function keep only the top X cancer and plot their age specific rate. The `group_by` option allow to compare different population. If the population data stops before 85+ (75+ for instance), the population data **must** be 0 when the population data is unknown so, the program can detect automatically the last age group (70+,75+,80+ or 85+) for population.

Value

Return plots and a `data.frame`.

plot_title= "USA",
plot_subtitle = "Top 5 cancer",
missing_age = 19
)
```

---

csu_asr   *csu_asr*

Description

csu_asr calculate Age-Standardized Rate (ASR) and Truncated Age-Standardized Rate (TASR) across different population (Registry, year, sex...)

Usage

```
csu_asr(df_data,
var_age = "age",
var_cases = "cases",
var_py ="py",
group_by=NULL,
var_age_group=NULL,
missing_age = NULL,
db_rate = 100000,
first_age = 1,
last_age = 18,
```

```
pop_base = "SEGI",
crude_rate = FALSE,
var_st_err = NULL,
correction_info = FALSE,
var_asr = "asr",
age_dropped = FALSE)
```

Arguments

df_data   Data (need to be R data.frame format, see example to import csv file).

var_age   Age variable. Several format are accepted

1	"0-4"	0
2	"5-9"	5
3	"10-14"	10
...	...	...
17	"80-84"	80
18	"85+"	85

Missing age value must be precise in the option missing_age.
Last age group will always be considere without size (ie: 80+,85+, etc..).

var_cases   Number of event (cases, deaths, ...) variable.

var_py   Population year variable.

group_by   A vector of variables to compare different ASR (sex, country, cancer ...).
                 Any variable included in the next option var_age_group **must** be also include here.

var_age_group   Variables over which the number of population age-group might change.
                 For example the last age group (70+, 75+, 80+ or 85+) can vary across registries, or year, but not across sex.

missing_age   Age value representing the missing age cases.
                 If not precise, missing age value will not affect the calculation.

db_rate   The denominator population. Default is 100000.

first_age   First age group included (for Truncated ASR), **must** be between 1 and 17. 1 represents 0-4, 2 represents 5-9, ... 5 represents 20-24 etc.

last_age   Last age group included (for Truncated ASR), **must** be between 2 and 18. 2 represents 5-9, ... 5 represents 20-24, ... 18 represents 85+ etc.
                 To calculate ASR for 15-69 years, use: first_age(4), last_age(14).

pop_base   Select the standard population:

"SEGI"	SEGI world standard population (1960).
"EURO"	EURO is the European standard population (1976).
"EURO2"	EURO2 is the European standard population (2013).

	"WHO"	WHO is the WHO standard population (2001).

crude_rate	Logical value. if TRUE calculate the crude rate instead of the ASR. Variables `var_age_group`, `missing_age`, `pop_base`, `var_st_err`, `correction_info` are not used. Default name of the new variable is "crude_rate".
var_st_err	Calculate the Standard error and name of the new variable.
correction_info	
	Logical value. if TRUE compute the variable "correction" : percentage of missing age cases.
var_asr	Name of the new variable for the ASR.
age_dropped	Only for truncated ASR. Logical value: if TRUE, Assume the age group not used are already dropped from the data. First_age and last_age option **must** still be filled.

Details

This function take automatically account the number of age group (last age group can be 70+,75+,80+,85+):
If the population data stops before 85+ (75+ for instance), the population data **must** be 0 when the
population data is unknown so, the program can detect automatically the last age group (70+,75+,80+
or 85+) for population.

Value

Give the list of population with less than 18 age group (last age group: 70+, 75+, 80+).
Return a `data.frame`.

---

csu_bar_top   *csu_bar_top*

Description

csu_bar_top plots top X single-sided or double-sided bar chart.

Usage

```
csu_bar_top(df_data,
var_value,
var_bar,
group_by=NULL,
nb_top = 10,
plot_title=NULL,
plot_subtitle=NULL,
xtitle= NULL,
label_by=NULL,
color=NULL,
digits = 1)
```

Arguments

df_data	Data (need to be R data.frame format, see examples to import csv file).
var_value	Value variable. There must be only 1 value for each bar.
var_bar	Bar label variable.
group_by	• Single-sided bar chart. NULL (default) • Double-sided bar chart. Variable name with exactly 2 values. (For example, "sex"). Must be filled if label_by argument is defined.
nb_top	Lowest Rank included. Default is 10.
plot_title	Title of the plot. (For example, "Top 10 cancer sites").
plot_subtitle	Subtitle of the plot. (For example, "Males").
xtitle	x-axe title. (For example, "Number of cases").
label_by	2 values vector. Will overwrite the legend label for double-sided bar chart. (See group_by). For example: c("Male", "Female").
color	The color codes are hexadecimal (e.g. "#FF0000") or predefined R color names (e.g. "red").

- Single-sided bar chart. 1 hexadecimal color code (same color for each bar) or variable name with a color associated to each bar label variable.
- Double-sided bar chart. 2 values vector. For example: c("#2c7bb6","#b62ca1").

digits   Number of decimal digits. Default: 1

Details

This function plots a top X (default is top 10) bar chart, single-sided or double sided.

Value

Return plots and a `data.frame`.

---

csu_CI5XII_data *Cancer in five continent volume XII.*

Description

CI5 XII summary database.

Usage

```
data("csu_CI5XII_data")
```

Format

A data frame with 1113210 observations on the following 10 variables.

id_code population code (integer)

id_label population label (character)

country_code UN country code (integer)

ethnic_code ethnic code (integer)

cancer_code cancer code (integer)

cancer_label cancer label (character)

sex sex (integer)

age age variable from 1 to 19. 1 is 0-4 years, 2 is 5-9, etc..., 17 is 80-84, 18 is 85+, 19 represents missing age. (integer)

cases Number of cases (incidence) (integer)

py Population-year: Reference population of the registry (integer)

period Period (character)

```

csu_ci5_mean   *cancer registry data*

Description

CI5 XII data, all population grouped.

Usage

```
data("csu_ci5_mean")
```

Format

A data frame with 1026 observations on the following 5 variables.

ci5_cancer_code cancer code

ci5_cancer_label cancer label

CSU_age_factor age variable from 1 to 18. 1 is 0-4 years, 2 is 5-9, etc..., 17 is 80-84, 18 is 85+.

CSU_C Number of cases (incidence)

CSU_P Population-year: Reference population

Details

This dataset have been created in order to compare age specific rate with the CI5XII mean directly on the age specific rate graph. Here is the table of cancer_label and cancer_code available:

ci5_cancer_code	ci5_cancer_label
1	Lip
2	Tongue
3	Mouth
4	Salivary glands
5	Tonsil
6	Other oropharynx
7	Nasopharynx
8	Hypopharynx
9	Pharynx unspecified
10	Oesophagus
11	Stomach
12	Small intestine
13	Colon
14	Rectum
15	Anus
16	Liver
17	Gallbladder
18	Pancreas
19	Nose, sinuses

20	Larynx
21	Lung
23	Bone
24	Melanoma of skin
25	Other skin
26	Mesothelioma
27	Kaposi sarcoma
28	Connective and soft tissue
29	Breast
30	Vulva
31	Vagina
32	Cervix uteri
33	Corpus uteri
35	Ovary
37	Placenta
38	Penis
39	Prostate
40	Testis
42	Kidney
43	Renal pelvis
44	Ureter
45	Bladder
47	Eye
48	Brain, nervous system
49	Thyroid
50	Adrenal gland
51	Other endocrine
52	Hodgkin disease
53	Non-Hodgkin lymphoma
54	Immunoproliferative diseases
55	Multiple myeloma
56	Lymphoid leukaemia
57	Myeloid leukaemia
58	Leukaemia unspecified
59	Myeloproliferative disorders
60	Myelodysplastic syndromes
62	All sites
63	All sites but skin

help(csu_ageSpecific)
```

---

csu_cumrisk   *csu_cumrisk*

Description

csu_cumrisk Calculate cumulative risk across different population (Registry, year, sex...)

Usage

```
csu_cumrisk(df_data,
var_age = "age",
var_cases = "cases",
var_py ="py",
group_by=NULL,
missing_age = NULL,
last_age = 15,
var_st_err=NULL,
correction_info=FALSE,
var_cumrisk="cumrisk")
```

Arguments

df_data   Data (need to be R data.frame format, see example to import csv file).

var_age   Age variable. Several format are accepted

1	"0-4"	0
2	"5-9"	5
3	"10-14"	10
...	...	...
17	"80-84"	80
18	"85+"	85

Missing age value must be precise in the option missing_age.
Last age group will always be considere without size (ie: 80+,85+, etc..).

var_cases   Number of event (cases, deaths, ...) variable.

`var_py`	Population year variable.
`group_by`	A vector of variables to compare different ASR (sex, country, cancer ...).
`missing_age`	Age value representing the missing age cases. If not precise, missing age value will not affect the calculation.
`last_age`	Last age group included, **must** be between 2 and 17. 2 represents 5-9, ... 5 represents 20-24, ..., 17 represents 80-84, 18 represents 85+ etc. default is 15 (calculates cumulative risk 0-74)
`var_st_err`	Calculate the Standard error and name of the new variable.
`correction_info`	
	Logical value. if TRUE compute the variable "correction" : percentage of missing age cases.
`var_cumrisk`	Name of the new variable for the cumulative risk.

Details

Calculate cumulative risk across different population
the age group include in cumulative risk will always exclude the last age group since we do not
know the size of the last age group (ie: 85+, 80+ etc..)

Value

Return a `data.frame`.

    last_age = 14,
    missing_age = 99)
```

---

csu_eapc	*csu_eapc*

Description

csu_eapc calculate the Estimated Annual Percentage Change (EAPC) of rates during a time period with the Confidence Interval (CI) across different population (Registry, year, sex...)

Usage

```
csu_eapc(df_data,
var_rate="asr",
var_year="year",
group_by=NULL,
var_eapc = "eapc",
CI_level = 0.95)
```

Arguments

df_data   Data (need to be R data.frame format, see example to import csv file).

var_rate   Rate variable. (Standardized or not, incidence, mortality, etc..)

var_year	Period variable. (Year, month, etc...)
group_by	A vector of variables to compare different EAPC (sex, country, cancer ...).
var_eapc	Name of the new variable for the EAPC.
	The variable for the CI will be name based on var_eapc + "_" + up/Low.
CI_level	Confidence interval level. Default is 0.95.

Details

This function use Generalized Linear Model (GLM):
glm(log(rate) ~ year, family=gaussian(link = "identity")).
0 value are ignored. More details in reference below.

Value

Return a dataframe.

```

---

csu_group_cases   *csu_group_cases*

Description

`csu_group_cases` groups individual data into 5 years age-group data and other user defined variable (sex, registry, etc...).
Optionally: Group cancer based on a standard ICD10 coding; Extract year from custom year format.

Usage

```
csu_group_cases(df_data,
var_age ,
group_by=NULL,
var_cases = NULL,
df_ICD = NULL,
var_ICD=NULL,
var_year = NULL,
all_cancer=FALSE)
```

Arguments

df_data	Individual data (need to be R `data.frame` format, see examples to import csv file).
var_age	Age variable. (Numeric). Value > 150 will be considered as missing age.
group_by	(Optional) A vector of variables to create the different population (sex, country, etc...).
var_cases	(Optional) cases variable: If there is already a variable for the number of cases.
df_ICD	(Optional) ICD file for ICD grouping information. Must have 2 fields: "ICD", "LABEL" . 2 formats are possible: Each ICD code separated by ICD group

ICD	LABEL
C82	NHL
C83	NHL
C84	NHL
C85	NHL
C96	NHL

ICD code already grouped.

ICD_group	LABEL
C82-85,C96	NHL

2 ICD codes separated by "-" includes all the ICD code between.
2 ICD codes separated by "," includes only these 2 ICD code.
For instance, C82-85, C96 (or C82-C85, C96) includes:
C82, C83, C84, C85 and C96
Must be filled if var_ICD argument is defined

example: ICD_group_GLOBOCAN

var_ICD   (Optional) ICD variable: ICD variable in the individual data.
            Must be filled if df_ICD argument is defined

var_year   (Optional) Year variable: Extract year from custom format , as long as the year
            is expressed with 4 digits (i.e. ("yyyymmdd","ddmmyyyy", "yyyy/mm","dd-
            mm-yyyy", etc..) and group data by year.

all_cancer (Optional) If TRUE, will calculate the number of cases for all cancers (C00-97)
            and all cancers but non-melanoma of skin (C00-97 but C44)
            Need var_ICD and df_ICD arguments to be defined

Details

For most analysis, individual cases database need to be grouped by category.
This function groups data by 5 years age-group and other user defined variable.
Next step will be to add 5 years population data. (see csu_merge_cases_pop).

Value

Return a dataframe.

Author(s)

Mathieu Laversanne

# you can export your result as csv file using write.csv:
# write.csv(result, file="result.csv")
```

---

csu_merge_cases_pop   *csu_merge_cases_pop*

Description

csu_merge_cases_pop merges registry data and population data, group by year and other user de-
fined variable (sex, registry, etc...).

Usage

```
csu_merge_cases_pop(df_cases,
df_pop,
var_age,
var_cases="cases",
var_py=NULL,
group_by=NULL)
```

Arguments

df_cases   Registry data group by 5 years-age group (need to be R data.frame format, see
                examples to import csv file).

df_pop   Population data group by 5-years age group (need to be R data.frame format,
                see examples to import csv file).

var_age   Age variable. Several format are accepted

1	0-4	0
2	5-9	5
3	10-14	10
...	...	...
17	80-84	80
18	85+	85

                This variable must be a variable with the same column name in both dataset
                (df_cases and df_pop).
                Age >= 85 in the df_pop dataset will be aggregated as 85+.

var_cases   Cases variable in the df_cases dataset.

var_py   (Optional) If population is "long format", name of the population variable in the
                df_pop dataset.
                If population data is wide format (see details), var_py must be NULL.

group_by   (Optional) A vector of variables to create the different population (sex, country,
                etc...).
                Each variable must be a variable with the same column name in both dataset
                (df_cases and df_pop).
                Do not include the "year" variable since it is automatically detected (see details).

Details

This function merges registry data and population for further analysis.
Both datasets must be group by 5-years age group.
If present, the year information in format "yyyy" will be detected automatically.
2 formats are accepted for population data:.
Long format: (year and population are 2 variables)

sex	age	pop	year
1	1	116128	2005
1	2	130995	2005
1	3	137556	2005
...	...	...	...
2	16	27171	2007
2	17	13585	2007
2	18	13585	2007

Wide format: (One column per year and no population variable, "yyyy" year format must be included in columns name)

sex	age	Y2013	Y2014	Y2015
1	0-4	215607	237346	247166
1	5-9	160498	152190	152113
1	10-14	175676	171794	165406
...	...	...	...	...
2	75-79	20625	20868	23434
2	80-84	7187	7276	7620
2	85+	2551	2597	2617

Value

Return a dataframe.

---

csu_registry_data_1   *cancer registry data*

Description

Cancer registry data for liver cancer, males, 2007, 4 registries.

Usage

```
data("csu_registry_data_1")
```

Format

A data frame with 76 observations on the following 5 variables.

age age variable from 1 to 19. 1 is 0-4 years, 2 is 5-9, etc..., 17 is 80-84, 18 is 85+, 19 represents missing age.

cases Number of cases (incidence)

py Population-year: Reference population of the registry

registry_label Name of the registry

registry Registry code

Details

this 4 registries have been selected for this example as they different number of age group (75+, 80+, 85+) and some have missing age cases.

var_year = "year",
group_by = NULL,
logscale = FALSE,
smoothing = NULL,
legend = csu_trend_legend(),
color_trend = NULL,
ytitle = "Age standardized rate per 100,000",
plot_title = "csu_title")
```

Arguments

df_data	Data (need to be R data.frame format, see example to import csv file).
var_trend	Statistics variable to be plot on Y axis. Usually for the ASR, but it could be the cumulative risk, or the number of cases.
var_year	Time variable.
group_by	Variable to compare different age specific rate (sex, country, cancer ...). Only one variable can be chosen.
logscale	Logical value: if TRUE Y-axis use logscale.
smoothing	Apply a smoothing using the R loess function. . The numerical parameter controls the degree of smoothing. See option span in loess.
legend	legend option: see csu_trend_legend. Use only if group_by is not NULL.
color_trend	Vector of color for the trend. The color codes are hexadecimal (e.g. "#FF0000") or predefined R color names (e.g. "red").
ytitle	Y-axis title. Default is "Age standardized rate per 100,000".
plot_title	Title of the plot.

Details

This function is design the plot a statistics over time. It has been design for the ASR by year, but can be used for other statistics over time period. The group_by option allow to compare different population or cancer.

Value

Return a plot.

csu_trendCohortPeriod   *csu_trendCohortPeriod*

Description

csu_trendCohortPeriod plot cohort period age specific graph.

Usage

```
csu_trendCohortPeriod(
  df_data,
  var_age = "age",
  var_cases="cases",
  var_py="py",
  var_year = "year",
  type = "Cohort",
  missing_age = NULL,
  logscale = TRUE,
  db_rate = 100000,
  first_age = 6,
  last_age = 16,
  year_group = 5,
  age_dropped=FALSE,
  plot_title = "csu_title",
  format_export = NULL,
  graph_dev =FALSE)
```

Arguments

df_data   Data (need to be R data.frame format, see example to import csv file).

var_age   Age variable. Several format are accepted

1	"0-4"	0
2	"5-9"	5
3	"10-14"	10
...	...	...
17	"80-84"	80
18	"85+"	85

Missing age value must be precise in the option missing_age.
Last age group will always be considere without size (ie: 80+,85+, etc..).

var_cases   Number of event (cases, deaths, ...) variable.

var_py   Population year variable.

var_year	Time variable.
type	Type of the plot:

"Cohort"	Cohort graph.
"Period"	Period graph.
"Both"	Cohort Period graph.

missing_age	Age value representing the missing age cases.
logscale	Logical value: if TRUE Y-axis use logscale.
db_rate	The denominator population. Default is 100000.
first_age	First age group included, **must** be between 1 and 17. 1 represents 0-4, 2 represents 5-9, ... 5 represents 20-24 etc. Default is 6 (25-29 years).
last_age	Last age group included, **must** be between 2 and 18. 2 represents 5-9, ... 5 represents 20-24, ... 18 represents 85+ etc. Default is 16 (75-79 years). To plot the age group from 15-19 years until 65-69 years, use: first_age(4), last_age(14)
year_group	Usually, data are regrouped in 5 years period. . The numerical parameter controls the size of the group.
age_dropped	Only if some age grouped are missing in the data. Logical value: if TRUE, assume the age group not used are already dropped from the data. First_age and last_age option **must** still be filled.
plot_title	Title of the plot.
format_export	export the graph in different format:

NULL	Plot in R studio windows.
"pdf"	Export in PDF format.
"tiff"	Export in TIFF 300dpi format.
"png"	Export in PNG 200dpi format.
"svg"	Export in SVG format. Can be edit with https://inkscape.org/fr/.

	The filename is the plot_title option.
graph_dev	If the plot is embedded in a graphics Device function (such as pdf()), the graph_dev option should be set to TRUE for the first graph to avoid a blank page.

Details

This function is design the plot a the age-specific cohort and period plot. The type option allow to choose between the 3 different graphics: "Cohort", "Period", or "Both". Please note than the cohort plot and the period plot can be superimposed if the first_age is too low.

Value

Return a plot.

---

csu_trend_legend   *csu_trend_legend*

Description

csu_trend_legend legend option use in Rcan package for trends.

Usage

```
csu_trend_legend(title=NULL, position="bottom",nrow=1, right_space_margin=1)
```

Arguments

title	Title of the legend. (only if position = "bottom").
position	Position of the legend:

"bottom"   The legend is place at the bottom of the graph. use with option nrow.

"right"   The legend is place at the right of each trend. use with option `right_space_margin`. If there is already a plot in th

nrow   Number of row of the legend (only if `position` = "bottom").

right_space_margin

                      If the `position` = "right", the right margin need to be enough big, to contain
                      the text legend. value should be between 1 and 10 depending the size of the text
                      legend.

Details

This function return a list for the trend graphics of the package `Rcan`

Value

Return a structured list.

data_individual_file   *Data individual example*

Description

Data individual example for the function csu_group_cases
1 line = 1 cases.

Usage

```
data("data_individual_file")
```

Format

A data frame with 19284 observations on the following 10 variables.

regcode registry code

reglabel registry label

sex sex

age age

doi date of birth (yyyymmdd)

site ICD10 code

histo histology

beh behavior code

grade grade

basis basis

Details

This dataset provide an example how to group individual cases to 5 years data, grouped by ICD
code and year using the function csu_group_cases and the database ICD_group_GLOBOCAN

See Also

```

---

data_population_file   *Population data example*

Description

Population data example for the function `csu_merge_cases_pop`.

Usage

```
data("data_population_file")
```

Format

A data frame with 160 observations on the following 4 variables.

year year

sex sex

age_group 5 year age group

pop Count of population year

Details

This dataset provide an example to merge 5 years age grouped data with population data using the function `csu_merge_cases_pop`

See Also

`csu_merge_cases_pop`

Examples

```
data(ICD_group_GLOBOCAN)
data(data_individual_file)
data(data_population_file)

#group individual data by
# 5 year age group
# ICD grouping from dataframe ICD_group_GLOBOCAN
# year (extract from date of incidence)

df_data_year <- csu_group_cases(data_individual_file,
  var_age="age",
  group_by=c("sex", "regcode", "reglabel"),
  df_ICD = ICD_group_GLOBOCAN,
  var_ICD ="site",
  var_year = "doi")

#Merge 5-years age grouped data with population by year (automatic) and sex

df_pop <- csu_merge_cases_pop(df_data_year, data_population_file, var_age = "age_group",

```

ICD_group_CI5   *ICD10 group detailed example*

Description

ICD10 group example for the function `csu_group_cases` based on CI5XII ICD grouping

Usage

```
data("ICD_group_CI5")
```

Format

A data frame with 97 observations on the following 2 variables.

ICD ICD10 code

LABEL label for cancer group

Details

This dataset provide an example how to regroup ICD code using the function `csu_group_cases`
For instance this group

ICD	LABEL
C18	COLORECTUM

C19	COLORECTUM
C20	COLORECTUM
C21	COLORECTUM

Will become:

ICD_group	LABEL
C18-C21	COLORECTUM

See: `csu_group_cases`
