Package 'wordnet'

June 8, 2024

Title WordNet Interface

Version 0.1-17

Description An interface to WordNet using the Jawbone Java API to WordNet.
WordNet (<https://wordnet.princeton.edu/>) is a large lexical database of
English. Nouns, verbs, adjectives and adverbs are grouped into sets of
cognitive synonyms (synsets), each expressing a distinct concept. Synsets
are interlinked by means of conceptual-semantic and lexical relations.
Please note that WordNet(R) is a registered tradename. Princeton
University makes WordNet available to research and commercial users
free of charge provided the terms of their license
(<https://wordnet.princeton.edu/license-and-commercial-use>) are followed,
and proper reference is made to the project using an appropriate
citation (<https://wordnet.princeton.edu/citing-wordnet>).
The WordNet database files need to be made available separately,
either via package 'wordnetDicts' from <https://datacube.wu.ac.at>,
installing system packages where available, or direct download from
<https://wordnetcode.princeton.edu/3.0/WNdb-3.0.tar.gz>.

Imports rJava (>= 0.6-3)

Suggests wordnetDicts

Additional_repositories <https://datacube.wu.ac.at>

SystemRequirements Java (>= 5.0); WordNet database files (direct
download:
<https://wordnetcode.princeton.edu/3.0/WNdb-3.0.tar.gz>; Debian
and Fedora package: wordnet)

getDict *Get Default Dictionary*

Description

The package **wordnet** tries to locate a valid WordNet installation on start up by investigating the WNHOME environment variable and by trying default installation locations. On success it acquires a pointer to the actual WordNet dictionary and stores internally a reference to the dictionary instance. getDict returns this default reference.

Usage

```
getDict()
```

Details

You can manually point the package to the WordNet installation via setDict.

Value

A dictionary instance.

Author(s)

Ingo Feinerer

M. Wallace (2007). Jawbone Java WordNet API. https://sites.google.com/site/mfwallace/jawbone

Examples

```
if(initDict())
  getDict()
```

---

getDictInstance   *Get a Dictionary Instance*

Description

Returns an instance to a WordNet dictionary.

Usage

```
getDictInstance()
```

Value

A dictionary object.

Author(s)

Ingo Feinerer

References

M. Wallace (2007). Jawbone Java WordNet API. https://sites.google.com/site/mfwallace/jawbone

Examples

```
if(initDict())
  getDictInstance()
```

---

getFilterTypes   *Get Available Filter Types*

Description

Get available filter types.

Usage

```
getFilterTypes()
```

Value

A character vector with available filter types.

Author(s)

Ingo Feinerer

References

M. Wallace (2007). Jawbone Java WordNet API. https://sites.google.com/site/mfwallace/jawbone

Examples

```
getFilterTypes()
```

---

getIndexTerms   *Get Index Terms*

Description

Get index terms from a WordNet dictionary as specified by a filter.

Usage

```
getIndexTerms(pos, maxLimit, filter)
```

Arguments

pos	Part of speech type. Must be either "ADJECTIVE", "ADVERB", "NOUN", or "VERB".
maxLimit	Maximum number of results.
filter	A term filter (see getTermFilter).

Value

A list of index terms.

Author(s)

Ingo Feinerer

References

M. Wallace (2007). Jawbone Java WordNet API. https://sites.google.com/site/mfwallace/jawbone

Examples

```
if(initDict()) {
  filter <- getTermFilter("StartsWithFilter", "car", TRUE)
  getIndexTerms("NOUN", 5, filter)
}
```

---

getLemma   *Get Index Term Lemma*

Description

Retrieve the lemma (i.e., word) of an index term.

Usage

```
getLemma(indexterm)
```

Arguments

indexterm   The index term whose lemma is returned.

Value

A character vector holding the index term lemma.

[getIndexTerms](#)

Examples

```
if(initDict()) {
  filter <- getTermFilter("StartsWithFilter", "car", TRUE)
  terms <- getIndexTerms("NOUN", 5, filter)
  sapply(terms, getLemma)
}
```

---

getRelatedSynsets   *Get Related Synsets for a Synset*

Description

Get related synsets for a given synset based on a pointer symbol.

Usage

```
getRelatedSynsets(synset, pointerSymbol)
```

Arguments

synset   Basic synset.

pointerSymbol   A symbol indicating the type of the related synsets. An overview is available at
                    https://wordnet.princeton.edu/documentation/wnsearch3wn.

Value

A list of synsets.

Author(s)

Ingo Feinerer

M. Wallace (2007). Jawbone Java WordNet API. https://sites.google.com/site/mfwallace/jawbone

See Also

[getSynsets](#)

Examples

```
if(initDict()) {
  filter <- getTermFilter("ExactMatchFilter", "hot", TRUE)
  terms <- getIndexTerms("ADJECTIVE", 5, filter)
  synsets <- getSynsets(terms[[1]])
  related <- getRelatedSynsets(synsets[[1]], "!")
  sapply(related, getWord)
}
```

---

getSynonyms   *Get Synonyms for an Index Term*

Description

Get synonyms for a given index term.

Usage

```
getSynonyms(indexterm)
```

Arguments

indexterm   The input index term.

Value

A character vector holding the synonyms for the given index term.

Author(s)

Ingo Feinerer

References

M. Wallace (2007). Jawbone Java WordNet API. https://sites.google.com/site/mfwallace/jawbone

[getIndexTerms](#)

Examples

```
if(initDict()) {
  filter <- getTermFilter("ExactMatchFilter", "company", TRUE)
  terms <- getIndexTerms("NOUN", 5, filter)
  getSynonyms(terms[[1]])
}
```

---

getSynsets   *Get Synsets for an Index Term*

Description

Get synsets for a given index term.

Usage

```
getSynsets(indexterm)
```

Arguments

indexterm   The input index term.

Value

A list of synsets.

Author(s)

Ingo Feinerer

References

M. Wallace (2007). Jawbone Java WordNet API. `https://sites.google.com/site/mfwallace/jawbone`

See Also

`getIndexTerms`

Examples

```
if(initDict()) {
  filter <- getTermFilter("ExactMatchFilter", "hot", TRUE)
  terms <- getIndexTerms("ADJECTIVE", 5, filter)
  getSynsets(terms[[1]])
}
```

---

getTermFilter   *Get a Term Filter*

Description

Get a term filter.

Usage

```
getTermFilter(type, word, ignoreCase)
```

Arguments

type	Filter type. Available filters are "ContainsFilter", "EndsWithFilter", "ExactMatchFilter", "RegexFilter", "SoundFilter", "StartsWithFilter", and "WildcardFilter". Can also be a unique abbreviation of an available filter name.
word	Term to be matched.
ignoreCase	Indicates whether lower and upper case are distinguished.

Value

A term filter.

Author(s)

Ingo Feinerer

References

M. Wallace (2007). Jawbone Java WordNet API. https://sites.google.com/site/mfwallace/jawbone

Examples

```
if(initDict())
  getTermFilter("StartsWithFilter", "car", TRUE)
```

---

getWord   *Get Synset Word*

Description

Get the words in a synset.

Usage

```
getWord(synset)
```

Arguments

synset   The synset whose words are returned.

Value

A character vector holding the words.

Author(s)

Ingo Feinerer

References

M. Wallace (2007). Jawbone Java WordNet API. https://sites.google.com/site/mfwallace/jawbone

See Also

getSynsets

Examples

```
if(initDict()) {
  filter <- getTermFilter("ExactMatchFilter", "hot", TRUE)
  terms <- getIndexTerms("ADJECTIVE", 5, filter)
  synsets <- getSynsets(terms[[1]])
  related <- getRelatedSynsets(synsets[[1]], "!")
  sapply(related, getWord)
}
```

---

initDict   *Initialize Dictionary*

Description

Initializes the WordNet dictionary using the Jawbone Java API to WordNet.

Usage

```
initDict(pathData = "")
```

Arguments

pathData   Path to the WordNet data files.

Details

In case the user supplied path is invalid the function tries to find the installation itself by investigating the WNHOME environment variable and by trying default installation locations.

Value

A logical value indicating whether a valid WordNet installation has been found.

Author(s)

Ingo Feinerer

Examples

```
## Not run: initDict("/usr/local/WordNet-3.0/dict")
```

---

setDict   *Set Default Dictionary*

Description

The package **wordnet** tries to locate a valid WordNet installation on start up by investigating the
WNHOME environment variable and by trying default installation locations. On success it acquires a
pointer to the actual WordNet dictionary and stores internally a reference to the dictionary instance.
However, if this procedure does not work automatically in your environment, you can provide the
path to the WordNet installation and set the internal default reference via this function.

Usage

```
setDict(pathData)
```

Arguments

pathData   Path to the WordNet data files.

Value

A dictionary instance.

Examples

```
## Not run: setDict("/usr/local/WordNet-3.0/dict")
```

---

synonyms   *Get Synonyms for a Word*

Description

Get synonyms for a given word.

Usage

```
synonyms(word, pos)
```

Arguments

word   The input word.

pos   Part of speech type. Must be either "ADJECTIVE", "ADVERB", "NOUN", or "VERB".

Value

A character vector holding the synonyms for the given word.
