Package 'BeastJar'

October 12, 2022

Type Package

Title JAR Dependency for MCMC Using 'BEAST'

Version 1.10.6

Description Provides JAR to perform Markov chain Monte Carlo (MCMC) inference using
the popular Bayesian Evolutionary Analysis by Sampling Trees 'BEAST' software library
of Suchard et al (2018) <doi:10.1093/ve/vey016>. 'BEAST' supports auto-tuning
Metropolis-Hastings, slice, Hamiltonian Monte Carlo and Sequential Monte Carlo
sampling for a large variety of composable standard and phylogenetic statistical
models using high performance computing. By placing the 'BEAST' JAR in this package,
we offer an efficient distribution system for 'BEAST' use by other R packages using
CRAN.

BeastJar	*BeastJar*

Description

Convenient packaging of the Bayesian Evolutionary Analysis Sampling Trees (BEAST) software
package to facilitate Markov chain Monte Carlo sampling techniques including Hamiltonian Monte
Carlo, bouncy particle sampling and zig-zag sampling.

Examples

```
# Example MCMC simulation using BEAST
#
# This function generates a Markov chain to sample from a simple normal distribution.
# It uses a random walk Metropolis kernel that is auto-tuning.

if (supportsJava8()) {
  # Set seed
  seed <- 123
  rJava::J("dr.math.MathUtils")$setSeed(rJava::.jlong(seed));

  # Set up simple model - Normal(mean = 1, sd = 2)
  mean <- 1; sd <- 2
  distribution <- rJava::.jnew("dr.math.distributions.NormalDistribution",
                              as.numeric(mean), as.numeric(sd))
  model <- rJava::.jnew("dr.inference.distribution.DistributionLikelihood",
                    rJava::.jcast(distribution, "dr.math.distributions.Distribution"))
  parameter <- rJava::.jnew("dr.inference.model.Parameter$Default", "p", 1.0,
                          as.numeric(-1.0 / 0.0), as.numeric(1.0 / 0.0))
  model$addData(parameter)

  # Construct posterior
  dummy <- rJava::.jnew("dr.inference.model.DefaultModel",
                        rJava::.jcast(parameter, "dr.inference.model.Parameter"))

  joint <- rJava::.jnew("java.util.ArrayList")
  joint$add(rJava::.jcast(model, "dr.inference.model.Likelihood"))
  joint$add(rJava::.jcast(dummy, "dr.inference.model.Likelihood"))

  joint <- rJava::new(rJava::J("dr.inference.model.CompoundLikelihood"), joint)

  # Specify auto-adapting random-walk Metropolis-Hastings transition kernel
  operator <- rJava::.jnew("dr.inference.operators.RandomWalkOperator",
                          rJava::.jcast(parameter, "dr.inference.model.Parameter"),
```

```
                                0.75,
                                rJava::J(

# Report posterior quantities
c(mean(sample), sd(sample))
}
```

---

supportsJava8   *Determine if Java virtual machine supports Java*

Description

Tests Java virtal machine (JVM) java.version system property to check if version >= 8.

Usage

```
supportsJava8()
```

Value

Returns TRUE if JVM supports Java >= 8.

Examples

```
supportsJava8()
```

Index
