Package 'ganGenerativeData'

October 7, 2024

Type Package

Title Generate Generative Data for a Data Source

Version 2.1.3

Date 2024-10-06

Author Werner Mueller [aut, cre]

Maintainer Werner Mueller <werner.mueller5@chello.at>

Description
Generative Adversarial Networks are applied to generate generative data for a data source. A generative model consisting of a generator and a discriminator network is trained. During iterative training the distribution of generated data is converging to that of the data source. Direct applications of generative data are the created functions for data evaluation and missing data completion. A software service for accelerated training of generative models on graphics processing units is available. Reference: Goodfellow et al. (2014) <doi:10.48550/arXiv.1406.2661>.

ganGenerativeData-package

Generate generative data for a data source

Description

Generative Adversarial Networks are applied to generate generative data for a data source. A generative model consisting of a generator and a discriminator network is trained. During iterative training the distribution of generated data is converging to that of the data source.

Generated data can be written to a file in training and after finished training in a separate generation step. First method accumulates generative data using a dynamic model, second method generates generative data using a static model.

Inserted images show two-dimensional projections of generative data for the iris dataset:

Generative Data for the Iris Dataset

Generative Data for the Iris Dataset
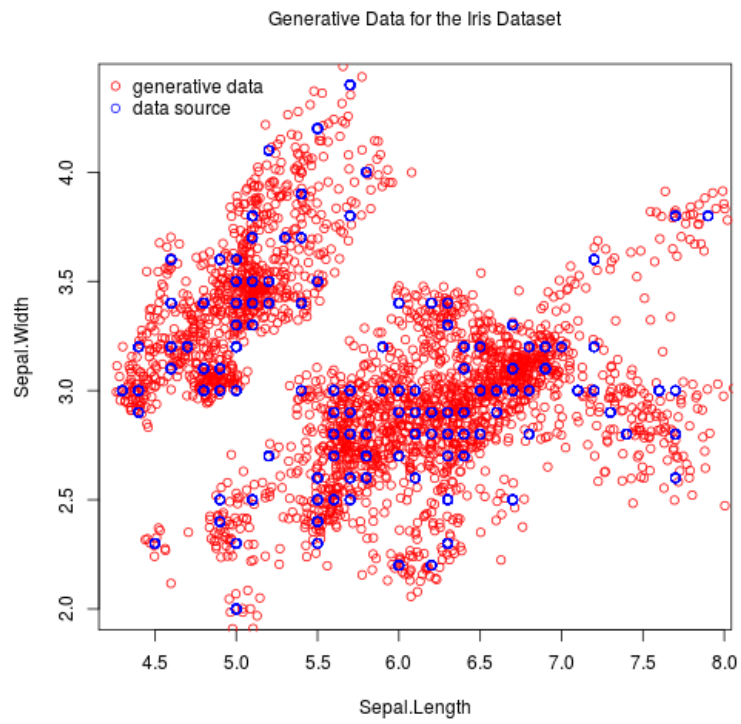

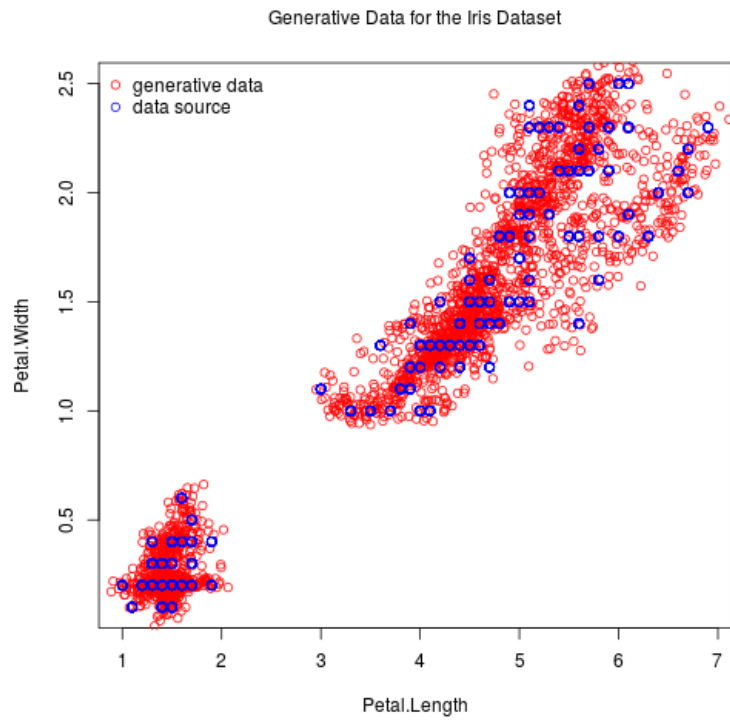

Method of data evaluation:

Let $M = (R^D, d)$ be the metric space with Euclidean distance d on R^D. Let X be a random vector consisting of D random variables and $(x_i)_{i=1}^n, x_i \in R^D$ a sequence of occurrences of X.

The k nearest neighbor density estimation function is defined by

$$de(x) = \frac{k}{nd^D(x_{i_k}, x)V_D}, x \in R^D$$

where k is the number of nearest neighbors, n is the number of occurrences, x_{i_k} is the k-th nearest neighbor, $d(x_{i_k}, x)$ is the Euclidean distance of k-th nearest neighbor to x, $V_D = \frac{\pi^{D/2}}{\Gamma(\frac{D}{2}+1)}$ is the volume of a unit sphere and $\Gamma(x)$ is the Gamma function.

We calculate density values by logarithmizing and normalizing $de(x)$. Next we set the density value of $x \in R^D$ into relation to density values of a sequence of occurrences of X by computing the inverse quantile. The received percent value is then used for evaluation of x.

In practice function gdCalulcateDensityValues() is called to calculate density values for generated generative data and for $x \in R^D$ function gdCalculateDensityValue() and gdDensityValueInverseQuantile() is called to receive a percent value for evaluation of x.

For illustration inserted images show generative data for a density value threshold for the iris dataset:

Generative Data with a Density Value Threshold for the Iris Dataset

Generative Data with a Density Value Threshold for the Iris Dataset
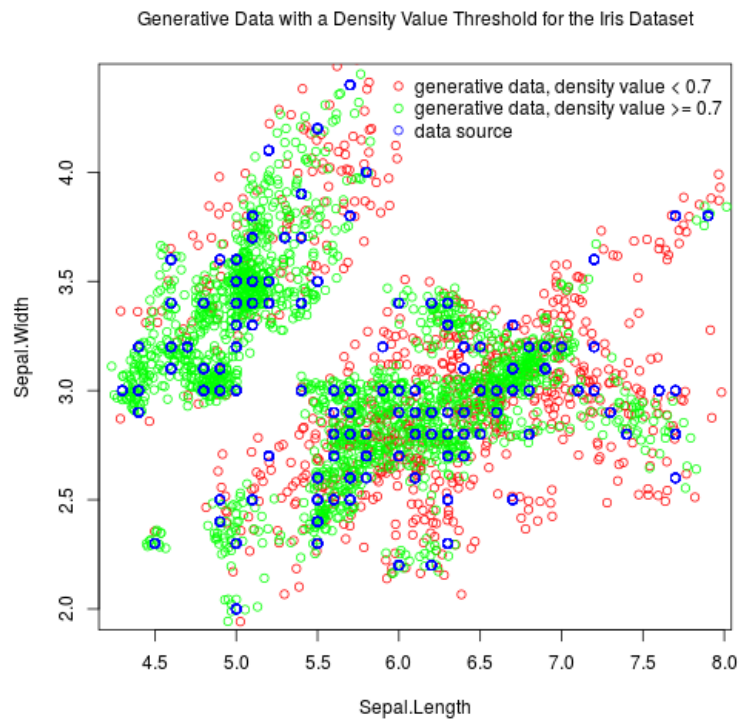

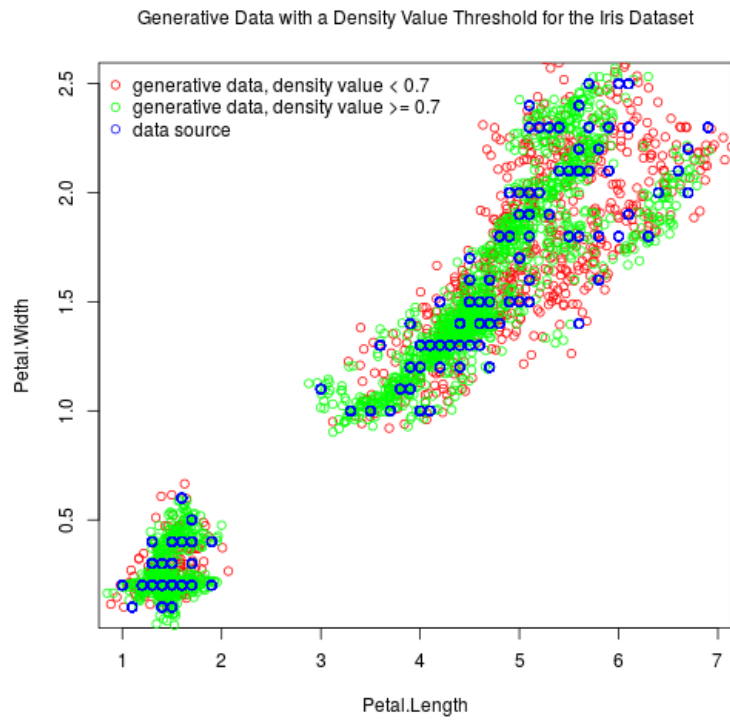

Method of missing data completion:

Without loss of generality we consider the case of two random variables X, Y. Let $g_{XY}(x, y)$ be the continuous probability density function of joint distribution X, Y and $G = ((x_i, y_i))_{i=1}^n$ a sequence of occurrences of X, Y.

In order to complete missing data for a given $X = x_0$ we consider the conditional probability density function $g_{Y|X=x_0}(y)$.

We compute the mean of $g_{XY}(x, y)$ over interval $[x_0 - \epsilon, x_0 + \epsilon]$ and then the limit by applying the rule of de l'Hospital

$$\lim_{\epsilon \to 0} 1/2\epsilon \int_{x_0 - \epsilon}^{x_0 + \epsilon} g_{XY}(x, y) dx = g_{Y|X=x_0}(y)$$

So the mean of $g_{XY}(x, y)$ over interval $[x_0 - \epsilon, x_0 + \epsilon]$ converges to $g_{Y|X=x_0}(y)$ for $\epsilon \to 0$ and the subsequence of occurrences of G in the interval is given by $G_{x_0, \epsilon} = ((x_{i_j}, y_{i_j}))$ with $1 <= i_j <= n, x_{i_j} \in [x_0 - \epsilon, x_0 + \epsilon]$.

A candidate for missing $Y = y_0$ for a given $X = x_0$ is then y_k of a uniform randomly selected (x_k, y_k) from $G_{x_0, \epsilon}$.

This is applied for generated generative data as follows:

In function `gdComplete()` the nearest neighbor for a given incomplete data record is searched with respect to present values and then utilized to complete the incomplete data record. Also function `gdKNearestNeighbors()` can be called. A nearest neighbor uniform randomly selected from returned k nearest neighbors can then be used for data record completion.

For illustration inserted images show k nearest neighbors for a sepal width value:

K Nearest Neighbors for a Sepal Width Value

K Nearest Neighbors for a Sepal Width Value
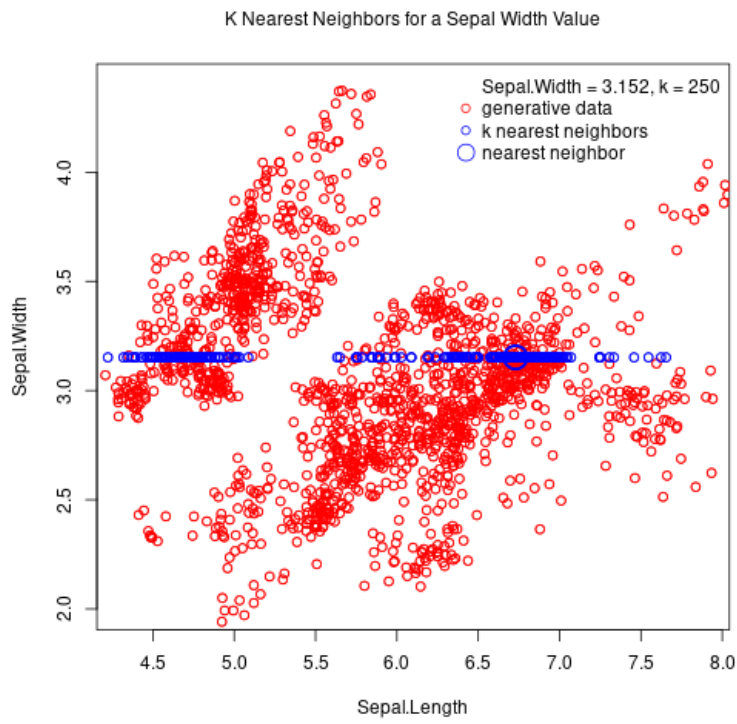

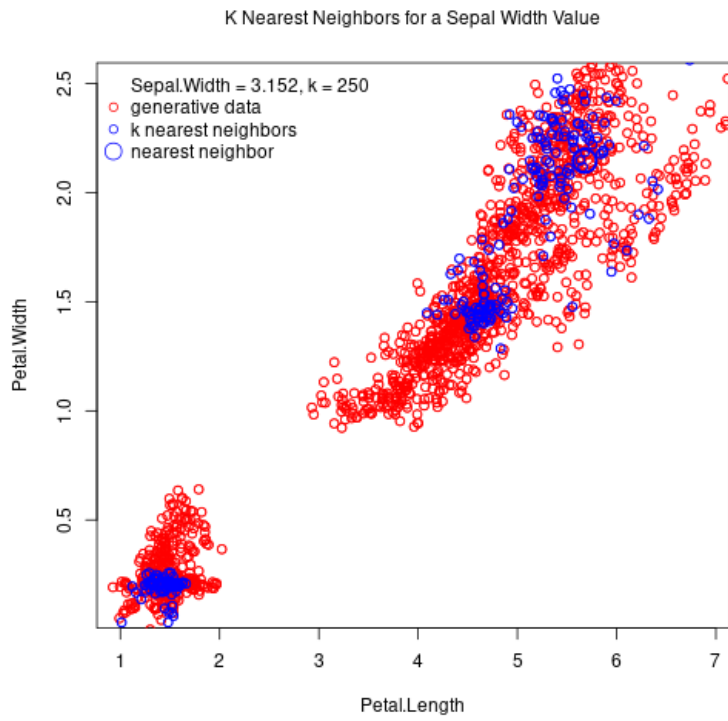

Accelerated training of generative models:

Training of generative models can be accelerated by using graphics processing units for computation. For this kind of training a software service is available. For access details contact the author of the package and see in the documentation in section Examples how training can be executed. The software service also supports training of generative models for mixed numerical and categorical variables.

Method of data classification:

With support of training of generative models for mixed numerical and categorical variables data classification can be done for a given labeled dataset and unlabeled data as follows:

1. Considering class labels as a categorical variable train a generative model for joint distribution of data records and class labels.

2. Apply method of missing data completion to determine class labels for unlabeled data records.

For illustration inserted images show generative data for the iris dataset with data records consisting of numerical variables sepal length, sepal width, petal length, petal width and assigned class labels:

Generative Data with Classes for the Iris Dataset

Generative Data with Classes for the Iris Dataset
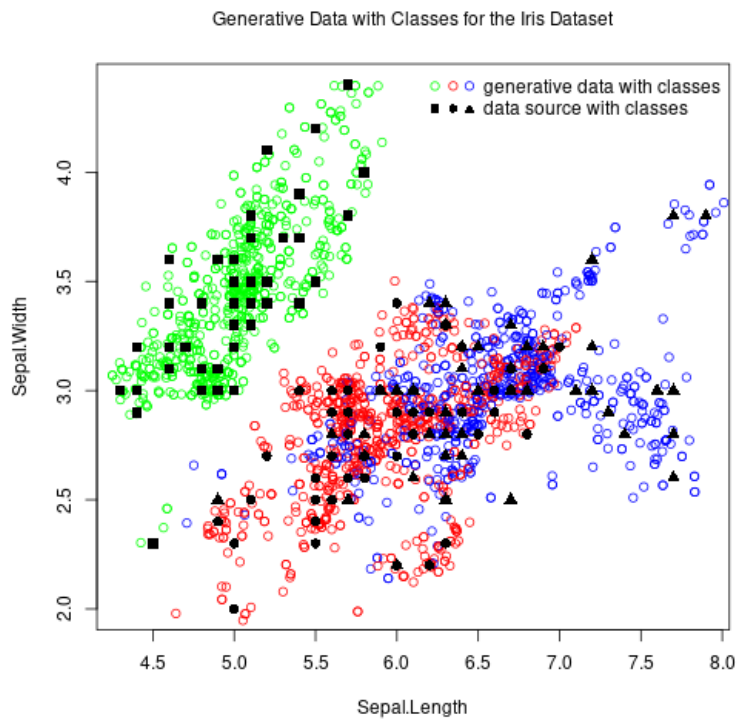

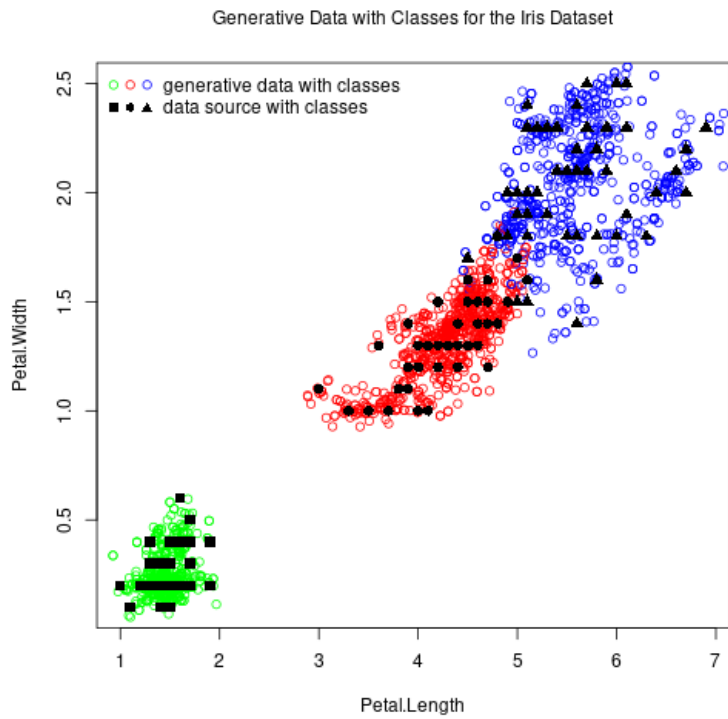

Details

The API includes functions for topics "definition of data source" and "generation of generative data". Main function of first topic is dsCreateWithDataFrame() which creates a data source with passed data frame. Main functions of second topic are gdTrain() which trains a generative model for a data source and gdGenerate() which uses a trained generative model to generate generative data. Additionally a software service for accelerated training of generative models is available.

1. Definition of data source

dsCreateWithDataFrame() Create a data source with passed data frame.

dsActivateColumns() Activate columns in a data source in order to include them in training of generative models. By default columns are active.

dsDeactivateColumns() Deactivate columns in a data source in order to exclude them from training of generative models. Note that the training function in the package supports only columns of type R-class numeric, R-type double. All columns of other type have to be deactivated. The training function in the software service for accelerated training of generative models supports columns of any type.

dsGetActiveColumnNames() Get names of active columns of a data source.

dsGetInactiveColumnNames() Get names of inactive columns of a data source.

dsWrite() Write created data source including settings of active columns to a file in binary format. This file will be used as input in functions of topic "generation of generative data".

dsRead() Read a data source from a file that was written with dsWrite().

dsGetNumberOfRows() Get number of rows in a data source.

dsGetRow() Get a row in a data source.

2. Training of generative model and generation of generative data

gdTrainParameters() Specify parameters for training of generative model.

gdTrain() Read a data source from a file, train a generative model that generates generative data for the data source in iterative training steps, write trained generative model and generated data in training steps to a file in binary format..

gdGenerateParameters() Specify parameters for generation of generative data.

gdGenerate() Read a generative model and a data source from a file, generate generative data for the data source and write generated data to a file in binary format.

gdCalculateDensityValues() Read generative data from a file, calculate density values and write generative data with density values to original file.

gdRead() Read generative data and data source from specified files.

gdPlotParameters() Specify plot parameters for generative data.

gdPlotDataSourceParameters() Specify plot parameters for data source.

gdPlotProjection() Create an image file containing two-dimensional projections of generative data and data source.

gdGetNumberOfRows() Get number of rows in generative data.

gdGetRow() Get a row in generative data.

gdCalculateDensityValue() Calculate density value for a data record.

gdDensityValueQuantile() Calculate density value quantile for a percent value.

gdDensityValueInverseQuantile() Calculate inverse density value quantile for a density value.

gdKNearestNeighbors() Search for k nearest neighbors in generative data.

gdComplete() Complete incomplete data record.

gdWriteSubset() Write subset of generative data.

3. Software service for accelerated training of generative models

gdServiceTrain() Send a request to software service to train a generative model.

gdServiceGetGenerativeData() Get generated generative data from software service.

gdServiceGetGenerativeModel() Get trained generative model from software service.

gdServiveGetStatus() Get status of generated job from software service.

gdServiceDelete() Delete generated job from software service.

---

dsActivateColumns   *Activate columns*

Description

Activate columns in a data source in order to include them in training of generative models. By
default columns are active.

Usage

```
dsActivateColumns(columnVector)
```

Arguments

columnVector   Vector of column indices

Value

None

Examples

```
dsCreateWithDataFrame(iris)
dsGetActiveColumnNames()
dsDeactivateColumns(c(5))
dsGetActiveColumnNames()
dsActivateColumns(c(5))
dsGetActiveColumnNames()
```

---

dsCreateWithDataFrame   *Create a data source with passed data frame*

Description

Create a data source with passed data frame.

Usage

```
dsCreateWithDataFrame(dataFrame)
```

Arguments

dataFrame   Name of data frame

Value

None

Examples

```
dsCreateWithDataFrame(iris)
```

---

dsDeactivateColumns   *Deactivate columns*

Description

Deactivate columns in a data source in order to exclude them from training of generative models. Note that the training function in the package supports only columns of type R-class numeric, R-type double. All columns of other type have to be deactivated. The training function in the software service for accelerated training of generative models supports columns of any type.

Usage

```
dsDeactivateColumns(columnVector)
```

Arguments

columnVector   Vector of column indices

Value

None

Examples

```
dsCreateWithDataFrame(iris)
dsDeactivateColumns(c(5))
dsGetInactiveColumnNames()
```

---

dsGetActiveColumnNames

Get active column names

Description

Get active column names of a data source

Usage

```
dsGetActiveColumnNames()
```

Value

Vector of names of active columns

Examples

```
dsCreateWithDataFrame(iris)
dsDeactivateColumns(c(5))
dsGetActiveColumnNames()
```

---

dsGetInactiveColumnNames

Get inactive column names

Description

Get inactive column names of a data source

Usage

```
dsGetInactiveColumnNames()
```

Value

Vector of names of inactive columns

Examples

```
dsCreateWithDataFrame(iris)
dsDeactivateColumns(c(5))
dsGetInactiveColumnNames()
```

---

dsGetNumberOfRows   *Get number of rows*

Description

Get number of rows in a data source

Usage

```
dsGetNumberOfRows()
```

Value

Number of rows

Examples

```
dsCreateWithDataFrame(iris)
dsGetNumberOfRows()
```

---

dsGetRow   *Get a row in a data source*

Description

Get a row in a data source for a row index.

Usage

```
dsGetRow(index)
```

Arguments

index   Index of row

Value

List containing row in data source

Examples

```
dsCreateWithDataFrame(iris)
dsGetRow(1)
```

---

dsRead *Read a data source from file*

Description

Read a data source from a file in binary format

Usage

```
dsRead(fileName)
```

Arguments

fileName   Name of data source file

Value

None

Examples

```
## Not run:
dsCreateWithDataFrame(iris)
dsDeactivateColumns(c(5))
dsWrite("ds.bin")
dsRead("ds.bin")
## End(Not run)
```

---

dsWrite *Write a data source to file*

Description

Write a data source including settings of active columns to a file in binary format. This file will be used as input in functions for generation of generative data.

Usage

```
dsWrite(fileName)
```

Arguments

fileName   Name of data source file

Value

None

Examples

```
## Not run:
dsCreateWithDataFrame(iris)
dsDeactivateColumns(c(5))
dsWrite("ds.bin")
## End(Not run)
```

---

gdCalculateDensityValue

Calculate density value for a data record

Description

Calculate density value for a data record. By default for the calculation a linear search is performed on generative data. When a search tree is used search is performed on a tree for generative data which is built once in the first function call.

Usage

```
gdCalculateDensityValue(dataRecord, useSearchTree = FALSE)
```

Arguments

dataRecord   List containing a data record

useSearchTree   Boolean value indicating if a search tree should be used.

Value

Normalized density value number

Examples

```
## Not run:
gdRead("gd.bin")
dv <- gdCalculateDensityValue(list(6.1, 2.6, 5.6, 1.4))
## End(Not run)
```

gdCalculateDensityValues

Calculate density values for generative data

Description

Read generative data from a file, calculate density values and write generative data with density values to original file. Calculated density values are used to classiy generative data. In function gdPlotParameters() density value thresholds with assigned colors can be passed to draw generative data for different density value ranges.

Usage

```
gdCalculateDensityValues(generativeDataFileName)
```

Arguments

generativeDataFileName

Name of generative data file name

Value

None

Examples

```
## Not run:
gdCalculateDensityValues("gd.bin")
## End(Not run)
```

gdComplete *Complete incomplete data record*

Description

Search for first nearest neighbor in generative data for incomplete data record containing NA values. Found row in generative data is then used to replace NA values in inccomplete data record. This function calls gdKNearestNeighbors() with parameter k equal to 1.

Usage

```
gdComplete(dataRecord, useSearchTree = FALSE)
```

Arguments

dataRecord   List containing incomplete data record

useSearchTree Boolean value indicating if a search tree should be used.

Value

List containing completed data record

Examples

```
## Not run:
gdRead("gd.bin")
gdComplete(list(5.1, 3.5, 1.4, NA))
## End(Not run)
```

---

gdDensityValueInverseQuantile

Calculate inverse density value quantile

Description

Calculate inverse density value quantile for a density value.

Usage

```
gdDensityValueInverseQuantile(densityValue)
```

Arguments

densityValue   Normalized density value

Value

Percent value

Examples

```
## Not run:
gdRead("gd.bin")
gdDensityValueInverseQuantile(0.5)
## End(Not run)
```

```
gdDensityValueQuantile
```
Calculate density value quantile

Description

Calculate density value quantile for a percent value.

Usage

```
gdDensityValueQuantile(percent)
```

Arguments

percent   Percent value

Value

Normalized density value quantile number

Examples

```
## Not run:
gdRead("gd.bin")
gdDensityValueQuantile(50)
## End(Not run)
```

```
gdGenerate
```
Generate generative data for a data source

Description

Read a trained generative model for a data source, generate generative data and write generated data
to a file in binary format.

Usage

```
gdGenerate(
  generativeDataFileName,
  generativeModelFileName,
 generateParameters = gdGenerateParameters(numberOfSamples = 10000, dropout = 0.05)
)
```

Arguments

generativeDataFileName

Name of generative data file

generativeModelFileName

Name of generative model file

generateParameters

Generation of generative data parameters, see function gdGenerateParameters().

Value

None

Examples

```
## Not run:
generateParameters <- gdGenerateParameters(numberOfSamples = 10000)
gdGenerate("gd.bin", "gm.bin", generateParameters)
## End(Not run)
```

---

gdGenerateParameters   *Specify parameters for generation of generative data*

Description

Specify parameters for generation of generative data. These parameters are passed to function gdGenerate().

Usage

```
gdGenerateParameters(numberOfSamples = 1e+05, dropout = 0.05)
```

Arguments

numberOfSamples

Number of generated samples

dropout   Value in the range of 0 to 1. Specifies the rate of hidden units that are dropped. Dropout is a regularization method to prevent overfitting. See function gdTrain-Parameters().

Value

List of parameters for generation of generative data

Examples

```
## Not run:
generateParameters <- gdGenerateParameters(numberOfSamples = 100000)
## End(Not run)
```

gdGetNumberOfRows *Get number of rows*

Description

Get number of rows in generative data

Usage

```
gdGetNumberOfRows()
```

Value

Number of rows

Examples

```
## Not run:
gdRead("gd.bin")
gdGetNumberOfRows()
## End(Not run)
```

gdGetRow *Get a row in generative data*

Description

Get a row in generative data for a row index

Usage

```
gdGetRow(index)
```

Arguments

index   Index of row

Value

List containing row in generative data

Examples

```
## Not run:
gdRead("gd.bin")
gdGetRow(1000)
## End(Not run)
```

---

gdKNearestNeighbors   *Search for k nearest neighbors*

Description

Search for k nearest neighbors in generative data for a data record. When the data record contains NA values only the non-NA values are considered in search. By default a linear search is performed. When a search tree is used search is performed on a tree which is built once in the first function call. Building a tree is also triggered when NA values in data records change in subsequent function calls.

Usage

```
gdKNearestNeighbors(dataRecord, k = 1L, useSearchTree = FALSE)
```

Arguments

dataRecord   List containing a data record

k   Number of nearest neighbors

useSearchTree Boolean value indicating if a search tree should be used.

Value

A list of rows in generative data

Examples

```
## Not run:
gdRead("gd.bin")
gdKNearestNeighbors(list(5.1, 3.5, 1.4, 0.2), 3)
## End(Not run)
```

---

gdPlotDataSourceParameters

Specify plot parameters for data source

Description

Specify plot parameters for data source passed to function gdPlotProjection().

Usage

```
gdPlotDataSourceParameters(percent = 100, color = "blue")
```

Arguments

`percent`	Percent of randomly selected rows in data source
`color`	Colour for data points of data source

Value

List of plot parameters for data source

Examples

```
## Not run:
gdPlotDataSourceParameters(2500)
## End(Not run)
```

`gdPlotParameters`	*Specify plot parameters for generative data*

Description

Specify plot parameters for generative data passed to function gdPlotProjection(). When density value thresholds with assigned colors are specified generative data is drawn for density value ranges in increasing order.

Usage

```
gdPlotParameters(
  percent = 10,
  densityValueThresholds = c(),
  densityValueColors = c("red")
)
```

Arguments

`percent`	Percent of randomly selected rows in generative data
`densityValueThresholds`	
	Vector of density value thresholds
`densityValueColors`	
	Vector of colors assigned to density value thresholds. The size must be the size of densityValueThresholds plus one.

Value

List of plot parameters for generative data

Examples

```
## Not run:
gdPlotParameters(50, c(0.75), c("red", "green"))
## End(Not run)
```

gdPlotProjection   *Create an image file for generative data and data source*

Description

Create an image file containing two-dimensional projections of generative data and data source.
Plot pagd_2500_6.binrameters for generative data and data source are passed by functions gdPlot-
Parameters() and gdPlotDataSourceParameters(). Data points of data source are drawn above data
points of generative data.

Usage

```
gdPlotProjection(
  imageFileName,
  title,
  columnIndices,
 generativeDataParameters = gdPlotParameters(percent = 10, densityValueThresholds = c(),
    densityValueColors = c("red")),
  dataSourceParameters = gdPlotDataSourceParameters(percent = 100, color = "blue")
)
```

Arguments

imageFileName	Name of image file
title	Title of image
columnIndices	Vector of two column indices that are used for the two-dimensional projections. Indices refer to indices of active columns of data source.
generativeDataParameters	
	Plot generative data parameters, see function gdPlotParameters().
dataSourceParameters	
	Plot data source parameters, see function gdPlotDataSourceParameters().

Value

None

Examples

```
## Not run:
gdRead("gd.bin", "ds.bin")
gdPlotProjection("gd12ddv.png",
 "Generative Data with a Density Value Threshold for the Iris Dataset", c(1, 2),
gdPlotParameters(250000, c(0.71), c("red", "green")),
gdPlotDataSourceParameters(2500))
gdPlotProjection("gd34ddv.png",
"Generative Data with a Densit(y Value Threshold for the Iris Dataset", c(3, 4),
gdPlotParameters(250000, c(0.71), c("red", "green")),
```

```
gdPlotDataSourceParameters(2500))
## End(Not run)
```

---

gdRead   *Read generative data and data source*

Description

Read generative data and data source from specified files. Read in generative data and data source are accessed in gdPlot2dProjection(), generative data is accessed in gdGetRow(), gdCalculateDensityValue() and gdCalculateDensityValueQuantile().

Usage

```
gdRead(generativeDataFileName, dataSourceFileName = "")
```

Arguments

generativeDataFileName
                Name of generative data file
dataSourceFileName
                Name of data source file

Value

None

Examples

```
## Not run:
gdRead("gd.bin", "ds.bin")
## End(Not run)
```

---

gdServiceDelete   *Delete a generated job from software service for accelerated training of generative models*

Description

Delete a generated job from software service. If the job is currently executed it it will be stopped.

Usage

```
gdServiceDelete(url, accessKey, jobId)
```

Arguments

`url`	URL of software service for accelerated training of generative models
`accessKey`	Unique key for access to software service
`jobId`	Job id for generated job for training a generative model

Value

None

Examples

```
## Not run:
url <- "http://xxx.xxx.xxx.xxx/gdService"
accessKey <- "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
gdServiceDelete(url, accessKey, 1)
## End(Not run)
```

`gdServiceGetGenerativeData`

Get generative data from software service for accelerated training of generative models for processed job

---

Description

Download generated generative data from software service for processed job. The status of the job has to be TRAINED.

Usage

```
gdServiceGetGenerativeData(
  url,
  accessKey,
  jobId,
  generativeDataFileName = NULL
)
```

Arguments

`url`	URL of software service for accelerated training of generative models
`accessKey`	Unique key for access to software service
`jobId`	Job id for generated job for training a generative model
`generativeDataFileName`	
	Name of generative data file. If name is NULL or empty string name of passed name to function gdServiceTrain() will be used.

Value

None

Examples

```
## Not run:
url <- "http://xxx.xxx.xxx.xxx/gdService"
accessKey <- "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
gdServiceGetGenerativeData(url, accessKey, 1, "gd.bin")
## End(Not run)
```

---

gdServiceGetGenerativeModel

Get generative model from software service for accelerated training of generative models for processed job

---

Description

Download trained generative model from software service for processed job. The status of the job has to be TRAINED.

Usage

```
gdServiceGetGenerativeModel(
  url,
  accessKey,
  jobId,
  generativeModelFileName = NULL
)
```

Arguments

url	URL of software service for accelerated training of generative models
accessKey	Unique key for access to software service
jobId	Job id for generated job for training a generative model
generativeModelFileName	
	Name of generative model file. If name is NULL or empty string name of passed name to function gdServiceTrain() will be used.

Value

None

Examples

```
## Not run:
url <- "http://xxx.xxx.xxx.xxx/gdService"
accessKey <- "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
gdServiceGetGenerativeModel(url, accessKey, 1,  "gm.bin")
## End(Not run)
```

---

gdServiceGetStatus	*Get status of generated job from software service for accelerated train-ing of generative models*

Description

Get status of generated job from software service. Defined status values are: CREATED, UP-LOADED, TRAINING, TRAINED, DELETED, ERROR.

Usage

```
gdServiceGetStatus(url, accessKey, jobId)
```

Arguments

url	URL of software service for accelerated training of generative models
accessKey	Unique key for access to software service
jobId	Job id for generated job for training a generative model

Value

List containing status information

Examples

```
## Not run:
url <- "http://xxx.xxx.xxx.xxx/gdService"
accessKey <- "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
gdServiceGetStatus(url, accessKey, 1)
## End(Not run)
```

---

gdServiceTrain *Send a request to software service for accelerated training of genera-*
tive models to train a generative model for a data source

Description

Send a request to software service to train a generative model. A data source file will be uploaded
and a job for training will be generated. A job id for the generated job will be returned which has to
be used in related requests. The job will be processed as soon as other waiting jobs are processed.
When a name of an existing generative model file is passed the file will be also uploaded and
the job will continue the training. See also functions gdTrain(), gdServiceGetGenerativeModel(),
gdServiceGetGenerativeData(), gdServiceGetStatus(), gdServiceDelete().

Usage

```
gdServiceTrain(
  url,
  accessKey,
  generativeModelFileName,
  generativeDataFileName,
  dataSourceFileName,
  trainParameters = gdTrainParameters(numberOfTrainingIterations = 10000,
    numberOfInitializationIterations = 2500, numberOfHiddenLayerUnits = 1024,
    learningRate = 7e-05, dropout = 0.05)
)
```

Arguments

url	URL of software service for accelerated training of generative models
accessKey	Unique key for access to software service
generativeModelFileName	
	Name of generative model file
generativeDataFileName	
	Name of generative data file. If name is NULL or empty string generated data will not be written to a file.
dataSourceFileName	
	Name of data source file
trainParameters	
	Generative model training parameters, see function gdTrainParameters().

Value

Job Id number

Examples

```
## Not run:
url <- "http://xxx.xxx.xxx.xxx/gdService"
accessKey <- "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
trainParameters <- gdTrainParameters(numberOfTrainingIterations = 10000)
jobId <- gdServiceTrain(url, accessKey, "gm.bin", "gd.bin", "ds.bin", trainParameters)
## End(Not run)
```

---

gdTrain   *Train a generative model for a data source*

Description

Read a data source from a file, train a generative model that generates generative data for the data
source in iterative training steps, write trained generative model and generated data in training steps
to a file in binary format. When a higher number of iterations is used the distribution of generated
data will get closer to that of the data source. When a name of an existing generative model file is
passed training will be continued.

Usage

```
gdTrain(
  generativeModelFileName,
  generativeDataFileName,
  dataSourceFileName,
  columnIndices,
  trainParameters = gdTrainParameters(numberOfTrainingIterations = 10000,
    numberOfInitializationIterations = 1500, numberOfHiddenLayerUnits = 1024,
    learningRate = 7e-05, dropout = 0.05)
)
```

Arguments

generativeModelFileName
                Name of generative model file

generativeDataFileName
                Name of generative data file. When name is NULL or empty string generated
                data will not be written to a file.

dataSourceFileName
                Name of data source file

columnIndices   Vector of two column indices that are used to plot two-dimensional projections
                of normalized generated generative data and data source for a training step. In-
                dices refer to indices of active columns of data source. Plotting can be disabled
                by passing NULL or an empty vector.

trainParameters
                Generative model training parameters, see function gdTrainParameters().

Value

None

Examples

```
## Not run:
trainParameters <- gdTrainParameters(numberOfTrainingIterations = 10000)
gdTrain("gm.bin", "gd.bin", "ds.bin", c(1, 2), trainParameters)
## End(Not run)
```

---

gdTrainParameters   *Specify parameters for training of generative model*

Description

Specify parameters for training of neural networks used for generation of generative data. These parameters are passed to function gdTrain().

Usage

```
gdTrainParameters(
  numberOfTrainingIterations = 10000,
  numberOfInitializationIterations = 1500,
  numberOfHiddenLayerUnits = 1024,
  learningRate = 7e-05,
  dropout = 0.05
)
```

Arguments

numberOfTrainingIterations

                Number of training iterations

numberOfInitializationIterations

                Number of initialization iterations

numberOfHiddenLayerUnits

                Number of hidden layer units

learningRate	Learning rate for training of neural networks
dropout	Value in the range of 0 to 1. Specifies the rate of hidden units that are dropped. Dropout is a regularization method to prevent overfitting.

Value

List of parameters for training of generative model

Examples

```
## Not run:
generateParameters <- gdGenerateParameters(numberOfTrainingIterations = 10000)
## End(Not run)
```

---

gdWriteSubset   *Write subset of generative data*

Description

Write subset of randomly selected rows of generative data

Usage

```
gdWriteSubset(fileName, percent)
```

Arguments

fileName	Name of subset generative data file
percent	Percent of randomly selected rows

Value

None

Examples

```
## Not run:
gdRead("gd.bin")
gdWriteSubset("gds.bin", 50)
## End(Not run)
```
