Description Provides data set and function for exploration of Multiple Indicator Cluster Sur-
vey (MICS) 2017-18 Men questionnaire data for Punjab, Pakistan. The results of the present sur-
vey are critically important for the purposes of Sustainable Development Goals (SDGs) monitor-
ing, as the survey produces information on 32 global Sustainable Development Goals (SDGs) in-
dicators. The data was collected from 53,840 households selected at the second stage with sys-
tematic random sampling out of a sample of 2,692 clusters selected using probability propor-
tional to size sampling. Six questionnaires were used in the survey: (1) a household question-
naire to collect basic demographic information on all de jure household members (usual resi-
dents), the household, and the dwelling; (2) a water quality testing questionnaire adminis-
tered in three households in each cluster of the sample; (3) a questionnaire for individ-
ual women administered in each household to all women age 15-49 years; (4) a question-
naire for individual men administered in every second household to all men age 15-
49 years; (5) an under-5 questionnaire, administered to mothers (or caretakers) of all children un-
der 5 living in the household; and (6) a questionnaire for children age 5-17 years, adminis-
tered to the mother (or caretaker) of one randomly selected child age 5-17 years liv-
ing in the household (<http://www.mics.unicef.org/surveys>).
