Package 'rock'

January 21, 2024

Title Reproducible Open Coding Kit

Version 0.8.1

Date 2024-01-21

Maintainer Gjalt-Jorn Peters <rock@opens.science>

Description The Reproducible Open Coding Kit ('ROCK', and this package, 'rock')
was developed to facilitate reproducible and open coding, specifically
geared towards qualitative research methods. Although it is a
general-purpose toolkit, three specific applications have been
implemented, specifically an interface to the 'rENA' package that
implements Epistemic Network Analysis ('ENA'), means to process notes
from Cognitive Interviews ('CIs'), and means to work with decentralized
construct taxonomies ('DCTs'). The 'ROCK' and this 'rock' package are described
in the ROCK book <https://rockbook.org> and more information, such as tutorials,
is available at <https://rock.science>.

---

add_html_tags   *Add HTML tags to a source*

Description

This function adds HTML tags to a source to allow pretty printing/viewing.

Usage

```
add_html_tags(
  x,
  context = NULL,
  codeClass = rock::opts$get(codeClass),
  codeValueClass = rock::opts$get(codeValueClass),
  idClass = rock::opts$get(idClass),
  sectionClass = rock::opts$get(sectionClass),
  uidClass = rock::opts$get(uidClass),
  contextClass = rock::opts$get(contextClass),
  utteranceClass = rock::opts$get(utteranceClass)
)
```

Arguments

x	A character vector with the source
context	Optionally, lines to pass the contextClass

codeClass, codeValueClass, idClass, sectionClass, uidClass, contextClass, utteranceClass

The classes to use for, respectively, codes, code values, class instance iden-
tifiers (such as case identifiers or coder identifiers), section breaks, utterance
identifiers, context, and full utterances. All <span> elements except for the full
utterances, which are placed in <div> elements.

Value

The character vector with the replacements made.

Examples

```
### Add tags to a mini example source
add_html_tags("[[cid=participant1]]
This is something this participant may have said.
Just like this. [[thisIsACode]]
---paragraph-break---
And another utterance.");
```

---

apply_graph_theme *Apply multiple DiagrammeR global graph attributes*

Description

Apply multiple DiagrammeR global graph attributes

Usage

```
apply_graph_theme(graph, ...)
```

Arguments

graph   The [DiagrammeR::DiagrammeR](#) graph to apply the attributes to.

...   One or more character vectors of length three, where the first element is the attribute, the second the value, and the third, the attribute type (graph, node, or edge).

Value

The [DiagrammeR::DiagrammeR](#) graph.

Examples

```
exampleSource <- '
---
codes:
  -
    id: parentCode
    label: Parent code
    children:
      -
        id: childCode1
      -
        id: childCode2
  -
    id: childCode3
    label: Child Code
    parentId: parentCode
    children: [grandChild1, grandChild2]
---
';
parsedSource <-
  parse_source(text=exampleSource);
miniGraph <-
  apply_graph_theme(data.tree::ToDiagrammeRGraph(parsedSource$deductiveCodeTrees),
                    c("color", "#0000AA", "node"),
                    c("shape", "triangle", "node"),
                    c("fontcolor", "#FF0000", "node"));
```

```
### This line should be run when executing this example as test, because
### rendering a DiagrammeR graph takes quite long
## Not run:
DiagrammeR::render_graph(miniGraph);

## End(Not run)
```

---

base30toNumeric   *Conversion between base10 and base30*

Description

The conversion functions from base10 to base30 and vice versa are used by the `generate_uids()` functions.

Usage

```
base30toNumeric(x)

numericToBase30(x)
```

Arguments

x   The vector to convert (numeric for `numericToBase30`, character for `base30toNumeric`).

Details

The symbols to represent the 'base 30' system are the 0-9 followed by the alphabet without vowels but including the y. This vector is available as `base30`.

Value

The converted vector (numeric for `base30toNumeric`, character for `numericToBase30`).

Examples

```
numericToBase30(654321);
base30toNumeric(numericToBase30(654321));
```

---

cat0 *Concatenate to screen without spaces*

Description

The cat0 function is to cat what paste0 is to paste; it simply makes concatenating many strings without a separator easier.

Usage

```
cat0(..., sep = "")
```

Arguments

`...`	The character vector(s) to print; passed to [cat](#).
`sep`	The separator to pass to [cat](#), of course, `""` by default.

Value

Nothing (invisible NULL, like [cat](#)).

Examples

```
cat0("The first variable is '", names(mtcars)[1], "'.");
```

---

checkPkgs *Check for presence of a package*

Description

This function efficiently checks for the presence of a package without loading it (unlike [library()](#) or [require()](#). This is useful to force yourself to use the package::function syntax for addressing functions; you can make sure required packages are installed, but their namespace won't attach to the search path.

Usage

```
checkPkgs(
  ...,
  install = FALSE,
  load = FALSE,
  repos = "https://cran.rstudio.com"
)
```

Arguments

`...`	A series of packages. If the packages are named, the names are the package names, and the values are the minimum required package versions (see the second example).
`install`	Whether to install missing packages from `repos`.
`load`	Whether to load packages (which is exactly *not* the point of this function, but hey, YMMV).
`repos`	The repository to use if installing packages; default is the RStudio repository.

Value

Invisibly, a vector of the available packages.

Examples

```
rock::checkPkgs('base');

### Require a version
rock::checkPkgs(rock = "0.5.0");

### This will show the error message
tryCatch(
  rock::checkPkgs(
    base = "99",
    stats = "42.5",
    ufs = 20
  ),
  error = print
);
```

---

ci_get_item   *Get an item in a specific language*

Description

This function takes a Narrative Response Model specification as used in NRM-based cognitive interviews, and composes an item based on the specified template for that item, the specified stimuli, and the requested language.

Usage

```
ci_get_item(nrm_spec, item_id, language)
```

Arguments

`nrm_spec`	The Narrative Response Model specification.
`item_id`	The identifier of the requested item.
`language`	The language of the stimuli.

Value

A character value with the item.

---

ci_heatmap	*Create a heatmap showing issues with items*

Description

When conducting cognitive interviews, it can be useful to quickly inspect the code distributions for each item. These heatmaps facilitate that process.

Usage

```
ci_heatmap(
  x,
  nrmSpec = NULL,
  language = nrmSpec$defaultLanguage,
  wrapLabels = 80,
  itemOrder = NULL,
  itemLabels = NULL,
  itemIdentifier = "uiid",
  codingScheme = "peterson",
  itemlab = NULL,
  codelab = NULL,
  freqlab = "Count",
  plotTitle = "Cognitive Interview Heatmap",
  fillScale = ggplot2::scale_fill_viridis_c(),
  theme = ggplot2::theme_minimal()
)
```

Arguments

`x`	The object with the parsed coded source(s) as resulting from a call to `parse_source()` or `parse_sources()`.
`nrmSpec`	Optionally, an imported Narrative Response Model specification, as imported with `ci_import_nrm_spec()`, which will then be used to obtain the item labels.
`language`	If `nrmSpec` is specified, the language to use.
`wrapLabels`	Whether to wrap the labels; if not `NULL`, the number of character to wrap at.

itemOrder, itemLabels

> Instead of specifying an NRM specification, you can also directly specify the item order and item labels. `itemOrder` is a character vector of item identifiers, and `itemLabels` is a named character vector of item labels, where each value's name is the corresponding item identifier. If `itemLabels` is provided but `itemOrder` is not, the order of the `itemLabel` is used.

itemIdentifier The column identifying the items; the class instance identifier prefix, e.g. if item identifiers are specified as `[[uiid:familySize_7djdy62d]]`, the itemIdentifier to pass here is `"uiid"`.

codingScheme The coding scheme, either as a string if it represents one of the cognitive interviewig coding schemes provided with the `rock` package, or as a coding scheme resulting from a call to create_codingScheme().

itemlab, codelab, freqlab

> Labels to use for the item and code axes and for the frequency color legend (`NULL` to omit the label).

plotTitle The title to use for the plot

fillScale Convenient way to specify the fill scale (the colours)

theme Convenient way to specify the ggplot2::ggplot() theme.

Value

The heatmap as a ggplot2 plot.

Examples

```
examplePath <- file.path(system.file(package="rock"), 'extdata');
parsedCI <- rock::parse_source(
  file.path(examplePath,
            "ci_example_1.rock")
);

rock::ci_heatmap(parsedCI,
                 codingScheme = "peterson");
```

---

ci_import_nrm_spec   *Import a Narrative Response Model specification*

Description

Narrative Response Models are a description of the theory of how a measurement instrument that measures a psychological construct works, geared towards conducting cognitive interviews to verify the validity of that measurement instrument. One a Narrative Response Model has been imported, it can be used to generate interview schemes, overview of each item's narrative response model, and combined with coded cognitive interview notes or transcripts.

Usage

```
ci_import_nrm_spec(
  x,
  read_ss_args = list(exportGoogleSheet = TRUE),
  defaultLanguage = NULL,
  silent = rock::opts$get("silent")
)

## S3 method for class 'rock_ci_nrm'
print(x, ...)
```

Arguments

x	A path to a file or an URL to a Google Sheet, passed to [read_spreadsheet()](#).
read_ss_args	A named list with arguments to pass to [read_spreadsheet()](#).
defaultLanguage	
	Language to set as default language (by default, i.e. if NULL, the first language is used).
silent	Whether to be silent or chatty.
...	Additional arguments are ignored.

Value

A `rock_ci_nrm` object.

---

cleaned_source_to_utterance_vector

Convert a character vector into an utterance vector

Description

Utterance vectors are split by the utterance marker. Note that if x has more than one element, the separate elements will remain separate.

Usage

```
cleaned_source_to_utterance_vector(
  x,
  utteranceMarker = rock::opts$get("utteranceMarker"),
  fixed = FALSE,
  perl = TRUE
)
```

Arguments

x	The character vector.
utteranceMarker	
	The utterance marker (by default, a newline character conform the ROCK standard).
fixed	Whether the `utteranceMarker` is a regular expression.
perl	If the `utteranceMarker` is a regular expression, whether it is a perl regular expression.

Value

A character vector with separate utterances, split by `utteranceMarker`.

Examples

```
cleaned_source_to_utterance_vector("first\nsecond\nthird");
```

---

clean_source   *Cleaning & editing sources*

Description

These functions can be used to 'clean' one or more sources or perform search and replace taks. Cleaning consists of two operations: splitting the source at utterance markers, and conducting search and replaces using regular expressions.

These functions can be used to 'clean' one or more sources or perform search and replace taks. Cleaning consists of two operations: splitting the source at utterance markers, and conducting search and replaces using regular expressions.

Usage

```
clean_source(
  input,
  output = NULL,
  replacementsPre = rock::opts$get("replacementsPre"),
  replacementsPost = rock::opts$get("replacementsPost"),
  extraReplacementsPre = NULL,
  extraReplacementsPost = NULL,
  removeNewlines = FALSE,
  removeTrailingNewlines = TRUE,
  rlWarn = rock::opts$get(rlWarn),
  utteranceSplits = rock::opts$get("utteranceSplits"),
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

```
clean_sources(
  input,
  output,
  outputPrefix = "",
  outputSuffix = "_cleaned",
  recursive = TRUE,
  filenameRegex = ".*",
  replacementsPre = rock::opts$get(replacementsPre),
  replacementsPost = rock::opts$get(replacementsPost),
  extraReplacementsPre = NULL,
  extraReplacementsPost = NULL,
  removeNewlines = FALSE,
  utteranceSplits = rock::opts$get(utteranceSplits),
  preventOverwriting = rock::opts$get(preventOverwriting),
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)

search_and_replace_in_source(
  input,
  replacements = NULL,
  output = NULL,
  preventOverwriting = TRUE,
  encoding = "UTF-8",
  rlWarn = rock::opts$get(rlWarn),
  silent = FALSE
)

search_and_replace_in_sources(
  input,
  output,
  replacements = NULL,
  outputPrefix = "",
  outputSuffix = "_postReplacing",
  preventOverwriting = rock::opts$get("preventOverwriting"),
  recursive = TRUE,
  filenameRegex = ".*",
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)

wordwrap_source(
  input,
  output = NULL,
  length = 60,
  removeNewlines = FALSE,
  removeTrailingNewlines = TRUE,
```

```
  rlWarn = rock::opts$get(rlWarn),
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent),
  utteranceMarker = rock::opts$get("utteranceMarker")
)
```

Arguments

input   For clean_source and search_and_replace_in_source, either a character
                   vector containing the text of the relevant source *or* a path to a file that contains
                   the source text; for clean_sources and search_and_replace_in_sources, a
                   path to a directory that contains the sources to clean.

output   For clean_source and search_and_replace_in_source, if not NULL, this is
                   the name (and path) of the file in which to save the processed source (if it *is* NULL,
                   the result will be returned visibly). For clean_sources and search_and_replace_in_sources,
                   output is mandatory and is the path to the directory where to store the processed
                   sources. This path will be created with a warning if it does not exist. An excep-
                   tion is if "same" is specified - in that case, every file will be written to the same
                   directory it was read from.

replacementsPre, replacementsPost
                   Each is a list of two-element vectors, where the first element in each vector
                   contains a regular expression to search for in the source(s), and the second el-
                   ement contains the replacement (these are passed as perl regular expressions;
                   see [regex](#) for more information). Instead of regular expressions, simple words
                   or phrases can also be entered of course (since those are valid regular expres-
                   sions). replacementsPre are executed before the utteranceSplits are ap-
                   plied; replacementsPost afterwards.

extraReplacementsPre, extraReplacementsPost
                   To perform more replacements than the default set, these can be conveniently
                   specified in extraReplacementsPre and extraReplacementsPost. This pre-
                   vents you from having to manually copypaste the list of defaults to retain it.

removeNewlines   Whether to remove all newline characters from the source before starting to
                   clean them. **Be careful**: if the source contains YAML fragments, these will also
                   be affected by this, and will probably become invalid!

removeTrailingNewlines
                   Whether to remove trailing newline characters (i.e. at the end of a character
                   value in a character vector);

rlWarn   Whether to let [readLines()](#) warn, e.g. if files do not end with a newline char-
                   acter.

utteranceSplits
                   This is a vector of regular expressions that specify where to insert breaks be-
                   tween utterances in the source(s). Such breakes are specified using utteranceMarker.

preventOverwriting
                   Whether to prevent overwriting of output files.

encoding   The encoding of the source(s).

silent   Whether to suppress the warning about not editing the cleaned source.

outputPrefix, outputSuffix

> The prefix and suffix to add to the filenames when writing the processed files to disk.

recursive   Whether to search all subdirectories (TRUE) as well or not.

filenameRegex   A regular expression to match against located files; only files matching this regular expression are processed.

replacements   The strings to search & replace, as a list of two-element vectors, where the first element in each vector contains a regular expression to search for in the source(s), and the second element contains the replacement (these are passed as `perl` regular expressions; see [regex](#) for more information). Instead of regular expressions, simple words or phrases can also be entered of course (since those are valid regular expressions).

length   At how many characters to word wrap.

utteranceMarker

> The character(s) between utterances (i.e. marking where one utterance ends and the next one starts). By default, this is a line break, and only change this if you know what you are doing.

Details

The cleaning functions, when called with their default arguments, will do the following:

- Double periods (..) will be replaced with single periods (.)

- Four or more periods (.... or .....) will be replaced with three periods

- Three or more newline characters will be replaced by one newline character (which will become more, if the sentence before that character marks the end of an utterance)

- All sentences will become separate utterances (in a semi-smart manner; specifically, breaks in speaking, if represented by three periods, are not considered sentence ends, wheread ellipses ("..." or unicode 2026, see the example) *are*.

- If there are comma's without a space following them, a space will be inserted.

The cleaning functions, when called with their default arguments, will do the following:

- Double periods (..) will be replaced with single periods (.)

- Four or more periods (.... or .....) will be replaced with three periods

- Three or more newline characters will be replaced by one newline character (which will become more, if the sentence before that character marks the end of an utterance)

- All sentences will become separate utterances (in a semi-smart manner; specifically, breaks in speaking, if represented by three periods, are not considered sentence ends, wheread ellipses ("..." or unicode 2026, see the example) *are*.

- If there are comma's without a space following them, a space will be inserted.

Value

A character vector for `clean_source`, or a list of character vectors, for `clean_sources`.

A character vector for `clean_source`, or a list of character vectors, for `clean_sources`.

Examples

```
exampleSource <-
"Do you like icecream?

Well, that depends\u2026 Sometimes, when it's..... Nice. Then I do,
but otherwise... not really, actually."

### Default settings:
cat(clean_source(exampleSource));

### First remove existing newlines:
cat(clean_source(exampleSource,
                 removeNewlines=TRUE));

### Example with a YAML fragment
exampleWithYAML <-
c(
  "Do you like icecream?",
  "",
  "",
  "Well, that depends\u2026 Sometimes, when it's..... Nice.",
  "Then I do,",
  "but otherwise... not really, actually.",
  "",
  "---",
  "This acts as some YAML. So this won't be split.",
  "Not real YAML, mind... It just has the delimiters, really.",
  "---",
  "This is an utterance again."
);

cat(
  rock::clean_source(
    exampleWithYAML
  ),
  sep="\n"
);

exampleSource <-
"Do you like icecream?

Well, that depends\u2026 Sometimes, when it's..... Nice. Then I do,
but otherwise... not really, actually."

### Simple text replacements:
cat(search_and_replace_in_source(exampleSource,
                                 replacements=list(c("\u2026", "..."),
                                                   c("Nice", "Great"))));

### Using a regular expression to capitalize all words following
```

```
### a period:
cat(search_and_replace_in_source(exampleSource,
                                 replacements=list(c("\\.(\\s*)([a-z])", ".\\1\\U\\2"))));

exampleSource <-
"Do you like icecream?

Well, that depends\u2026 Sometimes, when it's..... Nice. Then I do,
but otherwise... not really, actually."

### Default settings:
cat(clean_source(exampleSource));

### First remove existing newlines:
cat(clean_source(exampleSource,
                 removeNewlines=TRUE));

### Example with a YAML fragment
exampleWithYAML <-
c(
  "Do you like icecream?",
  "",
  "",
  "Well, that depends\u2026 Sometimes, when it's..... Nice.",
  "Then I do,",
  "but otherwise... not really, actually.",
  "",
  "---",
  "This acts as some YAML. So this won't be split.",
  "Not real YAML, mind... It just has the delimiters, really.",
  "---",
  "This is an utterance again."
);

cat(
  rock::clean_source(
    exampleWithYAML
  ),
  sep="\n"
);
```

---

codebook_fromSpreadsheet

Import a code book specification from a spreadsheet

Description

Import a code book specification from a spreadsheet

Usage

```
codebook_fromSpreadsheet(
  x,
  localBackup = NULL,
  exportGoogleSheet = TRUE,
  xlsxPkg = c("rw_xl", "openxlsx", "XLConnect"),
  silent = rock::opts$get("silent")
)
```

Arguments

x	The URL or path to a file.
localBackup	If not NULL, a valid filename to write a local backup to.
exportGoogleSheet	
	If x is a URL to a Google Sheet, instead of using the googlesheets4 package to download the data, by passing exportGoogleSheet=TRUE, an export link will be produced and the data will be downloaded as Excel spreadsheet.
xlsxPkg	Which package to use to work with Excel spreadsheets.
silent	Whether to be silent or chatty.

Value

The code book specification as a rock code book object

Examples

```
### This requires an active internet connection
if (FALSE) {
  gs_url <- paste0(
    "https://docs.google.com/spreadsheets/d/",
    "1gVx5uhYzqcTH6Jq7AYmsLvHSBaYaT-23c7ZhZF4jmps"
  );
  codebook <- rock::codebook_fromSpreadsheet(gs_url);
}
```

---

codebook_to_pdf   *Convert a codebook specification to PDF*

Description

Use this function to export your codebook specification to a PDF file. To embed it in an R Markdown file, use !!! CREATE rock::knit_codebook() !!!

Usage

```
codebook_to_pdf(
  x,
  file,
  author = NULL,
  headingLevel = 1,
  silent = rock::opts$get("silent")
)
```

Arguments

x	The codebook object (as produced by a call to codebook_fromSpreadsheet()).
file	The filename to save the codebook to.
author	The author to specify in the PDF.
headingLevel	The level of the top-most headings.
silent	Whether to be silent or chatty.

Value

x, invisibly

Examples

```
### Use a temporary file to write to
tmpFile <- tempfile(fileext = ".pdf");

### Load an example (pre)registration specification
data("exampleCodebook_1", package = "rock");

rock::codebook_to_pdf(
  exampleCodebook_1,
  file = tmpFile
);
```

---

codeIds_to_codePaths   *Replace code identifiers with their full paths*

Description

This function replaces the column names in the mergedSourceDf data frame in a rock_parsedSource or rock_parsedSources object with the full paths to those code identifiers.

Usage

```
codeIds_to_codePaths(
  x,
  stripRootsFromCodePaths = rock::opts$get("stripRootsFromCodePaths")
)
```

Arguments

x   A rock_parsedSource or rock_parsedSources object as returned by a call to
                [parse_source()](#) or [parse_sources()](#).

stripRootsFromCodePaths
                Whether to strip the roots first (i.e. the type of code)

Value

An adapted rock_parsedSource or rock_parsedSources object.

---

codePaths_to_namedVector
                        Get a vector to find the full paths based on the leaf code identifier

---

Description

This function names a vector with the leaf code using the codeTreeMarker stored in the [opts](#) object
as marker.

Usage

```
codePaths_to_namedVector(x)
```

Arguments

x   A vector of code paths.

Value

The named vector of code paths.

Examples

```
codePaths_to_namedVector(
  c("codes>reason>parent_feels",
    "codes>reason>child_feels")
);
```

code_freq_hist

code_freq_hist   *Create a frequency histogram for codes*

Description

Create a frequency histogram for codes

Usage

```
code_freq_hist(
  x,
  codes = ".*",
  sortByFreq = "decreasing",
  forceRootStripping = FALSE,
  trimSourceIdentifiers = 20,
  ggplot2Theme = ggplot2::theme(legend.position = "bottom"),
  silent = rock::opts$get("silent")
)
```

Arguments

x	A parsed source(s) object.
codes	A regular expression to select codes to include.
sortByFreq	Whether to sort by frequency decreasingly (decreasing, the default), increasingly (increasing), or alphabetically (NULL).
forceRootStripping	
	Force the stripping of roots, even if they are different.
trimSourceIdentifiers	
	If not NULL, the number of character to trim the source identifiers to.
ggplot2Theme	Can be used to specify theme elements for the plot.
silent	Whether to be chatty or silent.

Value

a [ggplot2::ggplot()](#).

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");
```

```
### Load example source
loadedExample <- rock::parse_source(exampleFile);

### Show code frequencies
code_freq_hist(loadedExample);
```

---

code_source   *Add one or more codes to one or more sources*

Description

These functions add codes to one or more sources that were read with one of the `loading_sources` functions.

Usage

```
code_source(
  input,
  codes,
  indices = NULL,
  output = NULL,
  decisionLabel = NULL,
  justification = NULL,
  justificationFile = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  rlWarn = rock::opts$get(rlWarn),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)

code_sources(
  input,
  codes,
  output = NULL,
  indices = NULL,
  outputPrefix = "",
  outputSuffix = "_coded",
  decisionLabel = NULL,
  justification = NULL,
  justificationFile = NULL,
  recursive = TRUE,
  filenameRegex = ".*",
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

Arguments

input	The source, or list of sources, as produced by one of the loading_sources functions.
codes	A named character vector, where each element is the code to be added to the matching utterance, and the corresponding name is either an utterance identifier (in which case the utterance with that identifier will be coded with that code), a code (in which case all utterances with that code will be coded with the new code as well), a digit (in which case the utterance at that line number in the source will be coded with that code), or a regular expression, in which case all utterances matching that regular expression will be coded with that source. If specifying an utterance ID or code, make sure that the code delimiters are included (normally, two square brackets).
indices	If input is a source as loaded by loading_sources, indices can be used to pass a logical vector of the same length as input that indicates to which utterance the code in codes should be applied. Note that if indices is provided, only the first element of codes is used, and its name is ignored.
output	If specified, the coded source will be written here.
decisionLabel	A description of the (coding) decision that was taken.
justification	The justification for this action.
justificationFile	
	If specified, the justification is appended to this file. If not, it is saved to the justifier::workspace(). This can then be saved or displayed at the end of the R Markdown file or R script using justifier::save_workspace().
preventOverwriting	
	Whether to prevent overwriting existing files.
rlWarn	Whether to let readLines() warn, e.g. if files do not end with a newline character.
encoding	The encoding to use.
silent	Whether to be chatty or quiet.
outputPrefix, outputSuffix	
	A prefix and/or suffix to prepend and/or append to the filenames to distinguish them from the input filenames.
recursive	Whether to also read files from all subdirectories of the input directory
filenameRegex	Only input files matching this patterns will be read.

Value

Invisibly, the coded source object.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");
```

```
### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Parse single example source
loadedExample <- rock::load_source(exampleFile);

### Show line 71
cat(loadedExample[71]);

### Specify the rules to code all utterances
### containing "Ipsum" with the code 'ipsum' and
### all utterances containing the code
codeSpecs <-
  c("(?i)ipsum" = "ipsum",
    "BC|AD|\\d\\d\\d\\ds" = "timeRef");

### Apply rules
codedExample <- code_source(loadedExample,
                            codeSpecs);

### Show line 71
cat(codedExample[71]);

### Also add code "foo" to utterances with code 'ipsum'
moreCodedExample <- code_source(codedExample,
                                c("[[ipsum]]" = "foo"));

### Show line 71
cat(moreCodedExample[71]);

### Use the 'indices' argument to add the code 'bar' to
### line 71
overCodedExample <- code_source(moreCodedExample,
                                "bar",
                                indices=71);

cat(overCodedExample[71]);
```

---

codingSchemes_get_all   *Convenience function to get a list of all available coding schemes*

Description

Convenience function to get a list of all available coding schemes

Usage

```
codingSchemes_get_all()
```

Value

A list of all available coding schemes

Examples

```
rock::codingSchemes_get_all();
```

---

collapse_occurrences   *Collapse the occurrences in utterances into groups*

Description

This function collapses all occurrences into groups sharing the same identifier, by default the `stanzaId` identifier (`[[sid=..]]`).

Usage

```
collapse_occurrences(
  parsedSource,
  collapseBy = "stanzaId",
  columns = NULL,
  logical = FALSE
)
```

Arguments

parsedSource	The parsed sources as provided by [parse_source()](#).
collapseBy	The column in the `sourceDf` (in the `parsedSource` object) to collapse by (i.e. the column specifying the groups to collapse).
columns	The columns to collapse; if unspecified (i.e. NULL), all codes stored in the code object in the `codings` object in the `parsedSource` object are taken (i.e. all used codes in the `parsedSource` object).
logical	Whether to return the counts of the occurrences (FALSE) or simply whether any code occurreded in the group at all (TRUE).

Value

A dataframe with one row for each value of of `collapseBy` and columns for `collapseBy` and each of the `columns`, with in the cells the counts (if `logical` is FALSE) or TRUE or FALSE (if `logical` is TRUE).

Examples

```
### Get path to example source
exampleFile <-
  system.file("extdata", "example-1.rock", package="rock");

### Parse example source
parsedExample <-
  rock::parse_source(exampleFile);

### Collapse logically, using a code (either occurring or not):
collapsedExample <-
  rock::collapse_occurrences(parsedExample,
                             collapseBy = 'childCode1');

### Show result: only two rows left after collapsing,
### because 'childCode1' is either 0 or 1:
collapsedExample;

### Collapse using weights (i.e. count codes in each segment):
collapsedExample <-
  rock::collapse_occurrences(parsedExample,
                             collapseBy = 'childCode1',
                             logical=FALSE);
```

```
collect_coded_fragments
```
Create an overview of coded fragments

Description

Collect all coded utterances and optionally add some context (utterances before and utterances after) to create an overview of all coded fragments per code.

Usage

```
collect_coded_fragments(
  x,
  codes = ".*",
  context = 0,
  includeDescendents = FALSE,
  attributes = NULL,
  heading = NULL,
  headingLevel = 3,
  add_html_tags = TRUE,
  cleanUtterances = FALSE,
  output = NULL,
```

```
  outputViewer = "viewer",
  template = "default",
  rawResult = FALSE,
  includeCSS = TRUE,
  codeHeadingFormatting = rock::opts$get("codeHeadingFormatting"),
  includeBootstrap = rock::opts$get("includeBootstrap"),
  preventOverwriting = rock::opts$get("preventOverwriting"),
  silent = rock::opts$get("silent")
)
```

Arguments

x	The parsed source(s) as provided by `rock::parse_source` or `rock::parse_sources`.
codes	The regular expression that matches the codes to include, or a character vector with codes or regular expressions for codes (which will be prepended with "^" and appended with "$", and then concatenated using "|" as a separator, to create a regular expression matching all codes).
context	How many utterances before and after the target utterances to include in the fragments. If two values, the first is the number of utterances before, and the second, the number of utterances after the target utterances.
includeDescendents	
	Whether to also collect the fragments coded with descendent codes (i.e. child codes, 'grand child codes', etc; in other words, whether to collect the fragments recursively).
attributes	To only select coded utterances matching one or more values for one or more attributes, pass a list where every element's name is a valid (i.e. occurring) attribute name, and every element is a character value with a regular expression specifying all values for that attribute to select.
heading	Optionally, a title to include in the output. The title will be prefixed with headingLevel hashes (#), and the codes with headingLevel+1 hashes. If NULL (the default), a heading will be generated that includes the collected codes if those are five or less. If a character value is specified, that will be used. To omit a heading, set to anything that is not NULL or a character vector (e.g. FALSE). If no heading is used, the code prefix will be headingLevel hashes, instead of headingLevel+1 hashes.
headingLevel	The number of hashes to insert before the headings.
add_html_tags	Whether to add HTML tags to the result.
cleanUtterances	
	Whether to use the clean or the raw utterances when constructing the fragments (the raw versions contain all codes). Note that this should be set to FALSE to have add_html_tags be of the most use.
output	Here, a path and filename can be provided where the result will be written. If provided, the result will be returned invisibly.
outputViewer	If showing output, where to show the output: in the console (outputViewer='console') or in the viewer (outputViewer='viewer'), e.g. the RStudio viewer. You'll usually want the latter when outputting HTML, and otherwise the former. Set to FALSE to not output anything to the console or the viewer.

template	The template to load; either the name of one of the ROCK templates (currently, only 'default' is available), or the path and filename of a CSS file.
rawResult	Whether to return the raw result, a list of the fragments, or one character value in markdown format.
includeCSS	Whether to include the ROCK CSS in the returned HTML.
codeHeadingFormatting	
	A character value of the form `%s *(path: %s)*` (the default) or `\n\n### %s\n\n*path:* ``%s``\n\n`. The first `%s` is replaced by the code identifier; the second `%s` by the corresponding path in the code tree.
includeBootstrap	
	Whether to include the default bootstrap CSS.
preventOverwriting	
	Whether to prevent overwriting of output files.
silent	Whether to provide (`FALSE`) or suppress (`TRUE`) more detailed progress updates.

Details

By default, the output is optimized for inclusion in an R Markdown document. To optimize output for the R console or a plain text file, without any HTML codes, set `add_html_tags` to FALSE, and potentially set `cleanUtterances` to only return the utterances, without the codes.

Value

Either a list of character vectors, or a single character value.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(
    examplePath, "example-1.rock"
  );

### Parse single example source
parsedExample <-
  rock::parse_source(
    exampleFile
  );

### Show organised coded fragments in Markdown
cat(
  rock::collect_coded_fragments(
    parsedExample
  )
);
```

```
### Only for the codes containing 'Code2'
cat(
  rock::collect_coded_fragments(
    parsedExample,
    'Code2'
  )
);
```

---

compress_with_sum   *Vector compression helper functions*

Description

These functions can help when compressing vectors. They always compress their input (x) into a single element by various means.

Usage

```
compress_with_sum(x)

compress_with_or(x)
```

Arguments

x   The vector to compress

Details

compress_with_sum computes the sum of the elements, doing its best to convert all input values to numeric values. compress_with_or returns 0 if all elements are FALSE, 0, NA or empty character values (""), and 1 otherwise.

Value

The compressed element

Examples

```
rock::compress_with_sum(c(1, '1', 0));
rock::compress_with_or(c(1, '1', 0));
rock::compress_with_or(c(0, '', 0, FALSE));
```

---

convertToNumeric   *Conveniently convert vectors to numeric*

Description

Tries to 'smartly' convert factor and character vectors to numeric.

Usage

```
convertToNumeric(vector, byFactorLabel = FALSE)
```

Arguments

vector   The vector to convert.

byFactorLabel   When converting factors, whether to do this by their label value (TRUE) or their
                level value (FALSE).

Value

The converted vector.

Examples

```
rock::convertToNumeric(as.character(1:8));
```

---

convert_df_to_source   *Convert 'rectangular' or spreadsheet-format data to one or more*
                          sources

Description

These functions first import data from a 'data format', such as spreadsheets in `.xlsx` format,
comma-separated values files (`.csv`), or SPSS data files (`.sav`). You can also just use R data frames
(imported however you want). These functions then use the columns you specified to convert these
data to one (oneFile=TRUE) or more (oneFile=FALSE) rock source file(s), optionally including
class instance identifiers (such as case identifiers to identify participants, or location identifiers, or
moment identifiers, etc) and using those to link the utterances to attributes from columns you spec-
ified. You can also precode the utterances with codes you specify (if you ever would want to for
some reason).

Usage

```
convert_df_to_source(
  data,
  output = NULL,
  omit_empty_rows = TRUE,
  cols_to_utterances = NULL,
  cols_to_ciids = NULL,
  cols_to_codes = NULL,
  cols_to_attributes = NULL,
  utterance_classId = NULL,
  oneFile = TRUE,
  cols_to_sourceFilename = cols_to_ciids,
  cols_in_sourceFilename_sep = "=",
  sourceFilename_prefix = "source_",
  sourceFilename_suffix = "",
  ciid_labels = NULL,
  ciid_separator = "=",
  attributesFile = NULL,
  preventOverwriting = rock::opts$get(preventOverwriting),
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)

convert_csv_to_source(
  file,
  importArgs = NULL,
  omit_empty_rows = TRUE,
  output = NULL,
  cols_to_utterances = NULL,
  cols_to_ciids = NULL,
  cols_to_codes = NULL,
  cols_to_attributes = NULL,
  oneFile = TRUE,
  cols_to_sourceFilename = cols_to_ciids,
  cols_in_sourceFilename_sep = "=",
  sourceFilename_prefix = "source_",
  sourceFilename_suffix = "",
  ciid_labels = NULL,
  ciid_separator = "=",
  attributesFile = NULL,
  preventOverwriting = rock::opts$get(preventOverwriting),
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)

convert_csv2_to_source(
  file,
  importArgs = NULL,
```

```
    omit_empty_rows = TRUE,
    output = NULL,
    cols_to_utterances = NULL,
    cols_to_ciids = NULL,
    cols_to_codes = NULL,
    cols_to_attributes = NULL,
    oneFile = TRUE,
    cols_to_sourceFilename = cols_to_ciids,
    cols_in_sourceFilename_sep = "=",
    sourceFilename_prefix = "source_",
    sourceFilename_suffix = "",
    ciid_labels = NULL,
    ciid_separator = "=",
    attributesFile = NULL,
    preventOverwriting = rock::opts$get(preventOverwriting),
    encoding = rock::opts$get(encoding),
    silent = rock::opts$get(silent)
)

convert_xlsx_to_source(
    file,
    importArgs = list(),
    omit_empty_rows = TRUE,
    output = NULL,
    cols_to_utterances = NULL,
    cols_to_ciids = NULL,
    cols_to_codes = NULL,
    cols_to_attributes = NULL,
    oneFile = TRUE,
    cols_to_sourceFilename = cols_to_ciids,
    cols_in_sourceFilename_sep = "=",
    sourceFilename_prefix = "source_",
    sourceFilename_suffix = "",
    ciid_labels = NULL,
    ciid_separator = "=",
    attributesFile = NULL,
    preventOverwriting = rock::opts$get(preventOverwriting),
    encoding = rock::opts$get(encoding),
    silent = rock::opts$get(silent)
)

convert_sav_to_source(
    file,
    importArgs = NULL,
    omit_empty_rows = TRUE,
    output = NULL,
    cols_to_utterances = NULL,
    cols_to_ciids = NULL,
```

```
    cols_to_codes = NULL,
    cols_to_attributes = NULL,
    oneFile = TRUE,
    cols_to_sourceFilename = cols_to_ciids,
    cols_in_sourceFilename_sep = "=",
    sourceFilename_prefix = "source_",
    sourceFilename_suffix = "",
    ciid_labels = NULL,
    ciid_separator = "=",
    attributesFile = NULL,
    preventOverwriting = rock::opts$get(preventOverwriting),
    encoding = rock::opts$get(encoding),
    silent = rock::opts$get(silent)
)
```

Arguments

data	The data frame containing the data to convert.
output	If oneFile=TRUE (the default), the name (and path) of the file in which to save the processed source (if it is NULL, the resulting character vector will be returned visibly instead of invisibly). Note that the ROCK convention is to use .rock as extension. If oneFile=FALSE, the path to which to write the sources (if it is NULL, as a result a list of character vectors will be returned visibly instead of invisibly).
omit_empty_rows	
	Whether to omit rows where the values in the columns specified to convert to utterances are all empty (or contain only whitespace).
cols_to_utterances	
	The names of the columns to convert to utterances, as a character vector.
cols_to_ciids	The names of the columns to convert to class instance identifiers (e.g. case identifiers), as a named character vector, with the values being the column names in the data frame, and the names being the class instance identifiers (e.g. "sourceId", "fieldId", "caseId", etc).
cols_to_codes	The names of the columns to convert to codes (i.e. codes appended to every utterance), as a character vector. When writing codes, it is not possible to also write multiple utterance columns (i.e. utterance_classId must be NULL).
cols_to_attributes	
	The names of the columns to convert to attributes, as a named character vector, where each name is the name of the class instance identifier to attach the attribute to. If only one column is passed in cols_to_ciids, names can be omitted and a regular unnamed character vector can be passed.
utterance_classId	
	When specifying multiple columns with utterances, and utterance_classId is not NULL, the column names are considered to be class instance identifiers, and specified above each utterance using the class identifier specified here (e.g. "utterance_classId="originalColName"" yields something like "[[originalColName=colName_1]]

                                 above all utterances from the column named `colName_1`). When writing multiple utterance columns, it is not possible to also write codes (i.e. `cols_to_codes` must be `NULL`).

`oneFile`   Whether to store everything in one source, or create one source for each row of the data (if this is set to `FALSE`, make sure that `cols_to_sourceFilename` specifies one or more columns that together uniquely identify each row; also, in that case, `output` must be an existing directory on your PC).

`cols_to_sourceFilename`

                                   The columns to use as unique part of the filename of each source. These will be concatenated using `cols_in_sourceFilename_sep` as a separator. Note that the final string *must* be unique for each row in the dataset, otherwise the filenames for multiple rows will be the same and will be overwritten! By default, the columns specified with class instance identifiers are used.

`cols_in_sourceFilename_sep`

                                   The separator to use when concatenating the `cols_to_sourceFilename`.

`sourceFilename_prefix, sourceFilename_suffix`

                                   Strings that are prepended and appended to the `col_to_sourceFilename` to create the full filenames. Note that `.rock` will always be added to the end as extension.

`ciid_labels`   The labels for the class instance identifiers. Class instance identifiers have brief codes used in coding (e.g. 'cid' is the default for Case Identifiers, often used to identify participants) as well as more 'readable' labels that are used in the attributes (e.g. 'caseId' is the default class instance identifier for Case Identifiers). These can be specified here as a named vector, with each element being the label and the element's name the identifier.

`ciid_separator` The separator for the class instance identifier - by default, either an equals sign (`=`) or a colon (`:`) are supported, but an equals sign is less ambiguous.

`attributesFile` Optionally, a file to write the attributes to if you don't want them to be written to the source file(s).

`preventOverwriting`

                                   Whether to prevent overwriting of output files.

`encoding`   The encoding of the source(s).

`silent`   Whether to suppress the warning about not editing the cleaned source.

`file`   The path to a file containing the data to convert.

`importArgs`   Optionally, a list with named elements representing arguments to pass when importing the file.

Value

A source as a character vector.

Examples

```
### Get path to example files
examplePath <-
  system.file("extdata", package="rock");
```

```
### Get a path to file with example data frame
exampleFile <-
  file.path(examplePath, "spreadsheet-import-test.csv");

### Read data into a data frame
dat <-
  read.csv(exampleFile);

### Convert data frame to a source
source_from_df <-
  convert_df_to_source(
    dat,
    cols_to_utterances = c("open_question_1",
                           "open_question_2"),
    cols_to_ciids = c(cid = "id"),
    cols_to_attributes = c("age", "gender"),
    cols_to_codes = c("code_1", "code_2"),
    ciid_labels = c(cid = "caseId")
  );

### Show the result
cat(
  source_from_df,
  sep = "\n"
);
```

---

create_codingScheme   *Create a coding scheme*

Description

This function can be used to specify a coding scheme that can then be used in analysis.

Usage

```
create_codingScheme(
  id,
  label,
  codes,
  codingInstructions = NULL,
  description = "",
  source = ""
)

codingScheme_peterson

codingScheme_levine

codingScheme_willis
```

Arguments

`id`	An identifier for this coding scheme, consisting only of letters, numbers, and underscores (and not starting with a number).
`label`	A short human-readable label for the coding scheme.
`codes`	A character vector with the codes in this scheme.
`codingInstructions`	
	Coding instructions; a named character vector, where each element is a code's coding instruction, and each element's name is the corresponding code.
`description`	A description of this coding scheme (i.e. for information that does not fit in the label).
`source`	Optionally, a description, reference, or URL of a source for this coding scheme.

Format

An object of class `rock_codingScheme` of length 5.

An object of class `rock_codingScheme` of length 5.

An object of class `rock_codingScheme` of length 5.

Details

A number of coding schemes for cognitive interviews are provided:

codingScheme_peterson Coding scheme from Peterson, Peterson & Powell, 2017

codingScheme_levine Coding scheme from Levine, Fowler & Brown, 2005

codingScheme_willis Coding scheme from Willis, 1999

Value

The coding scheme object.

---

create_cooccurrence_matrix

Create a co-occurrence matrix

Description

This function creates a co-occurrence matrix based on one or more coded sources. Optionally, it plots a heatmap, simply by calling the [stats::heatmap()](#) function on that matrix.

Usage

```
create_cooccurrence_matrix(
  x,
  codes = x$convenience$codingLeaves,
  plotHeatmap = FALSE
)
```

Arguments

x	The parsed source(s) as provided by rock::parse_source or rock::parse_sources.
codes	The codes to include; by default, takes all codes.
plotHeatmap	Whether to plot the heatmap.

Value

The co-occurrence matrix; a matrix.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Parse a selection of example sources in that directory
parsedExamples <-
  rock::parse_sources(
    examplePath,
    regex = "(test|example)(.txt|.rock)"
  );

### Create cooccurrence matrix
rock::create_cooccurrence_matrix(parsedExamples);
```

---

css   *Create HTML fragment with CSS styling*

Description

Create HTML fragment with CSS styling

Usage

```
css(
  template = "default",
  includeBootstrap = rock::opts$get("includeBootstrap")
)
```

Arguments

template	The template to load; either the name of one of the ROCK templates (currently, only 'default' is available), or the path and filename of a CSS file.
includeBootstrap	
	Whether to include the default bootstrap CSS.

Value

A character vector with the HTML fragment.

---

doc_to_txt   *Convert a document (.docx, .pdf, .odt, .rtf, or .html) to a plain text file*

Description

This used to be a thin wrapper around `textreadr::read_document()` that also writes the result
to `output`, doing its best to correctly write UTF-8 (based on the approach recommended in this
blog post). However, `textreadr` was archived from CRAN. It now directly wraps the functions
that `textreadr` wraps: `pdftools::pdf_text()`, `striprtf::read_rtf`, and it uses `xml2` to import
`.docx` and `.odt` files, and `rvest` to import `.html` files, using the code from the `textreadr` package.

Usage

```
doc_to_txt(
  input,
  output = NULL,
  encoding = rock::opts$get("encoding"),
  newExt = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  silent = rock::opts$get("silent")
)
```

Arguments

input	The path to the input file.
output	The path and filename to write to. If this is a path to an existing directory (without a filename specified), the `input` filename will be used, and the extension will be replaced with `extension`.
encoding	The encoding to use when writing the text file.
newExt	The extension to append: only used if `output = NULL` and `newExt` is not `NULL`, in which case the output will be written to a file with the same name as `input` but with `newExt` as extension.
preventOverwriting	
	Whether to prevent overwriting existing files.
silent	Whether to the silent or chatty.

Value

The converted source, as a character vector.

Examples

```
### This example requires the {xml2} package
if (requireNamespace("xml2", quietly = TRUE)) {
  print(
    rock::doc_to_txt(
      input = system.file(
        "extdata/doc-to-test.docx", package="rock"
      )
    )
  );
}
```

---

exampleCodebook_1 *An very rudimentary example codebook specification*

Description

This is a simple and relatively short codebook specification.

Usage

```
exampleCodebook_1
```

Format

An example of a codebook specification

---

expand_attributes *Expand categorical attribute variables to a series of dichotomous variables*

Description

Expand categorical attribute variables to a series of dichotomous variables

Usage

```
expand_attributes(
  data,
  attributes,
  valueLabels = NULL,
  prefix = "",
  glue = "__",
  suffix = "",
  falseValue = 0,
  trueValue = 1,
  valueFirst = TRUE,
  append = TRUE
)
```

Arguments

`data`	The data frame, normally the `$qdt` data frame that exists in the object returned by a call to `parse_sources()`.
`attributes`	The name of the attribute(s) to expand.
`valueLabels`	It's possible to use different names for the created variables than the values of the attributes. This can be set with the `valueLabels` argument. If only one attribute is specified, pass a named vector for `valueLabels`, and if multiple attributes are specified, pass a named list of named vectors, where the name of each vector corresponds to an attribute passed in `attributes`. The names of the vector elements must correspond to the values of the attributes (see the example).
`prefix, suffix`	The prefix and suffix to add to the variables names that are returned.
`glue`	The glue to paste the first part ad the second part of the composite variable name together.
`falseValue, trueValue`	
	The values to set for rows that, respectively, do not match and do match an attribute value.
`valueFirst`	Whether to insert the attribute value first, or the attribute name, in the composite variable names.
`append`	Whether to append the columns to the supplied data frame or not.

Value

A data.frame

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Parse single example source
parsedExample <- rock::parse_source(exampleFile);

### Create a categorical attribute column
parsedExample$qdt$age_group <-
  c(rep(c("<18", "18-30", "31-60", ">60"),
        each=19),
    rep(c("<18", ">60"),
        time = c(3, 4)));

### Expand to four logical columns
parsedExample$qdt <-
  rock::expand_attributes(
    parsedExample$qdt,
```

```
    "age_group",
    valueLabels =
      c(
        "<18" = "youngest",
        "18-30" = "youngish",
        "31-60" = "oldish",
        ">60" = "oldest"
      ),
    valueFirst = FALSE
);

### Show some of the result
table(parsedExample$qdt$age_group,
      parsedExample$qdt$age_group__youngest);
table(parsedExample$qdt$age_group,
      parsedExample$qdt$age_group__oldish);
```

---

exportToHTML   *Exporting tables to HTML*

Description

This function exports data frames or matrices to HTML, sending output to one or more of the console, viewer, and one or more files.

Usage

```
exportToHTML(
  input,
  output = rock::opts$get("tableOutput"),
  tableOutputCSS = rock::opts$get("tableOutputCSS")
)
```

Arguments

input	Either a `data.frame`, `table`, or `matrix`, or a list with three elements: `pre`, `input`, and `post`. The `pre` and `post` are simply prepended and postpended to the HTML generated based on the `input$input` element.
output	The output: a character vector with one or more of `"console"` (the raw concatenated input, without conversion to HTML), `"viewer"`, which uses the RStudio viewer if available, and one or more filenames in existing directories.
tableOutputCSS	The CSS to use for the HTML table.

Value

Invisibly, the (potentially concatenated) `input` as character vector.

Examples

```
exportToHTML(mtcars[1:5, 1:5]);
```

---

export_codes_to_txt   *Export codes to a plain text file*

Description

These function can be used to convert one or more parsed sources to HTML, or to convert all sources to tabbed sections in Markdown.

Usage

```
export_codes_to_txt(
  input,
  output = NULL,
  codeTree = "fullyMergedCodeTrees",
  codingScheme = "codes",
  regex = ".*",
  onlyChildrenOf = NULL,
  leavesOnly = TRUE,
  includePath = TRUE,
  preventOverwriting = rock::opts$get(preventOverwriting),
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)
```

Arguments

input	An object of class `rock_parsedSource` (as resulting from a call to `parse_source`) or of class `rock_parsedSources` (as resulting from a call to `parse_sources`.
output	THe filename to write to.
codeTree	Codes from which code tree to export the codes. Valid options are `fullyMergedCodeTrees`, `extendedDeductiveCodeTrees`, `deductiveCodeTrees`, and `inductiveCodeTrees`.
codingScheme	With the ROCK, it's possible to use multiple coding scheme's in parallel. The ROCK default is called codes (using the double square brackets as code delimiters), but other delimiters can be used as well, and give a different name. Use codingScheme to specify which code tree you want to export, if you have multiple.
regex	An optional regular expression: only codes matching this regular expression will be selected.
onlyChildrenOf	A character vector of one or more regular expressions that specify codes within which to search. For example, if the code tree contains codes `parent1` and `parent2`, and each have a number of child codes, and `parent` is passed as `onlyChildrenOf`, only the codes within `parent` are selected.
leavesOnly	Whether to only write the leaves (i.e. codes that don't have children) or all codes in the code tree.

includePath	Whether to only return the code itself (e.g. code) or also include the path to the root (e.g. code1>code2>code).
preventOverwriting	
	Whether to prevent overwriting of output files.
encoding	The encoding to use when writing the exported source(s).
silent	Whether to suppress messages.

Value

A character vector.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Parse a selection of example sources in that directory
parsedExamples <-
  rock::parse_sources(
    examplePath,
    regex = "(test|example)(.txt|.rock)"
  );

### Show results of exporting the codes
rock::export_codes_to_txt(parsedExamples);

### Only show select a narrow set of codes
rock::export_codes_to_txt(
  parsedExamples,
  leavesOnly=TRUE,
  includePath=FALSE,
  onlyChildrenOf = "inductFather",
  regex="3|5"
);
```

---

export_mergedSourceDf_to_csv
Export a merged source data frame

Description

Export a merged source data frame

Usage

```
export_mergedSourceDf_to_csv(
  x,
  file,
  exportArgs = list(fileEncoding = rock::opts$get("encoding")),
  preventOverwriting = rock::opts$get("preventOverwriting"),
  silent = rock::opts$get("silent")
)

export_mergedSourceDf_to_csv2(
  x,
  file,
  exportArgs = list(fileEncoding = rock::opts$get("encoding")),
  preventOverwriting = rock::opts$get("preventOverwriting"),
  silent = rock::opts$get("silent")
)

export_mergedSourceDf_to_xlsx(
  x,
  file,
  exportArgs = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  silent = rock::opts$get("silent")
)

export_mergedSourceDf_to_sav(
  x,
  file,
  exportArgs = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  silent = rock::opts$get("silent")
)
```

Arguments

x	The object with parsed sources.
file	The file to export to.
exportArgs	Optionally, arguments to pass to the function to use to export.
preventOverwriting	
	Whether to prevent overwriting if the file already exists.
silent	Whether to be silent or chatty.

Value

Silently, the object with parsed sources.

---

export_to_html	*Export parsed sources to HTML or Markdown*

Description

These function can be used to convert one or more parsed sources to HTML, or to convert all sources to tabbed sections in Markdown.

Usage

```
export_to_html(
  input,
  output = NULL,
  template = "default",
  fragment = FALSE,
  preventOverwriting = rock::opts$get(preventOverwriting),
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)

export_to_markdown(
  input,
  heading = "Sources",
  headingLevel = 2,
  template = "default",
  silent = rock::opts$get(silent)
)
```

Arguments

input	An object of class rock_parsedSource (as resulting from a call to parse_source) or of class rock_parsedSources (as resulting from a call to parse_sources.
output	For export_to_html, either NULL to not write any files, or, if input is a single rock_parsedSource, the filename to write to, and if input is a rock_parsedSources object, the path to write to. This path will be created with a warning if it does not exist.
template	The template to load; either the name of one of the ROCK templates (currently, only 'default' is available), or the path and filename of a CSS file.
fragment	Whether to include the CSS and HTML tags (FALSE) or just return the fragment(s) with the source(s) (TRUE).
preventOverwriting	
	For export_to_html, whether to prevent overwriting of output files.
encoding	For export_to_html, the encoding to use when writing the exported source(s).
silent	Whether to suppress messages.
heading, headingLevel	
	For

Value

A character vector or a list of character vectors.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Parse a selection of example sources in that directory
parsedExamples <- rock::parse_sources(
  examplePath,
  regex = "(test|example)(.txt|.rock)"
);

### Export results to a temporary directory
tmpDir <- tempdir(check = TRUE);
prettySources <-
  export_to_html(input = parsedExamples,
                 output = tmpDir);

### Show first one
print(prettySources[[1]]);
```

---

extract_codings_by_coderId

Extract the codings by each coder using the coderId

Description

Extract the codings by each coder using the coderId

Usage

```
extract_codings_by_coderId(
  input,
  recursive = TRUE,
  filenameRegex = ".*",
  postponeDeductiveTreeBuilding = TRUE,
  ignoreOddDelimiters = FALSE,
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)
```

Arguments

`input`	The directory with the sources.
`recursive`	Whether to also process subdirectories.
`filenameRegex`	Only files matching this regular expression will be processed.
`postponeDeductiveTreeBuilding`	
	Whether to build deductive code trees, or only store YAML fragments.
`ignoreOddDelimiters`	
	Whether to throw an error when encountering an odd number of YAML delimiters.
`encoding`	The encoding of the files to read.
`silent`	Whether to be chatty or silent.

Value

An object with the read sources.

---

form_to_rmd_template   *Convert a (pre)registration form to an R Markdown template*

Description

This function creates an R Markdown template from a {preregr} (pre)registrations form specification. Pass it the URL to a Google Sheet holding the (pre)registration form specification (in {preregr} format), see the "Creating a form from a spreadsheet" vignette), the path to a file with a spreadsheet holding such a specification, or a loaded or imported {preregr} (pre)registration form.

Usage

```
form_to_rmd_template(
  x,
  file = NULL,
  title = NULL,
  author = NULL,
  date = "`r format(Sys.time(), \"%H:%M:%S on %Y-%m-%d %Z (UTC%z)\")`",
  output = "html_document",
  yaml = list(title = title, author = author, date = date, output = output),
  includeYAML = TRUE,
  chunkOpts = "echo=FALSE, results='hide'",
  justify = FALSE,
  headingLevel = 1,
  showSpecification = FALSE,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  silent = rock::opts$get("silent")
)
```

Arguments

x	The (pre)registration form (as produced by a call to `preregr::form_create()` or `preregr::import_from_html()`) or initialized `preregr` object (as produced by a call to `preregr::prereg_initialize()` or `preregr::import_from_html()`); or, for the printing method, the R Markdown template produced by a call to `preregr::form_to_rmd_template()`.
file	Optionally, a file to save the html to.
title	The title to specify in the template's YAML front matter.
author	The author to specify in the template's YAML front matter.
date	The date to specify in the template's YAML front matter.
output	The output format to specify in the template's YAML front matter.
yaml	It is also possible to specify the YAML front matter directly using this argument. If used, it overrides anything specified in `title`, `author`, `date` and `output`.
includeYAML	Whether to include the YAML front matter or omit it.
chunkOpts	The chunk options to set for the chunks in the template.
justify	Whether to use `preregr::prereg_specify()` as function for specifying the (pre)registration content (if `FALSE`), or `preregr::prereg_justify()` (if `TRUE`).
headingLevel	The level of the top-most heading to use (the title of the (pre)registration form).
showSpecification	
	Whether to show the specification in the Rmd output. When `FALSE`, the `preregr` option `silent` is set to `TRUE` at the start of the Rmd template; otherwise, it is set to `FALSE`.
preventOverwriting	
	Set to `FALSE` to override overwrite prevention.
silent	Whether to be silent or chatty.

Value

x, invisibly

Examples

```
preregr::form_create(
  title = "Example form",
  version = "0.1.0"
) |>
  preregr::form_to_rmd_template();
```

| generate_uids | *Generate utterance identifiers (UIDs)* |

Description

This function generates utterance identifiers.

Usage

```
generate_uids(x, origin = Sys.time())
```

Arguments

x   The number of identifiers te generate.

origin   The origin to use when generating the actual identifiers. These identifiers are the
              present UNIX timestamp (i.e. the number of seconds elapsed since the UNIX
              epoch, the first of january 1970), accurate to two decimal places (i.e. to centisec-
              onds), converted to the base 30 system using numericToBase30(). By default,
              the present time is used as origin, one one centisecond is added for every identi-
              fiers to generate. origin can be set to other values to work with different origins
              (of course, don't use this unless you understand very well what you're doing!).

Value

A vector of UIDs.

Examples

```
rock::generate_uids(5);

### Show how UIDs are the converted date/time
x <- rock::generate_uids(1);
x;
x_UID <- gsub(
  "\\[\\[uid=(.*)\\]\\]",
  "\\1",
  x
);
x_as_nr <- rock::base30toNumeric(x_UID);
x_as_timestamp <- x_as_nr / 100;
x_as_date <-
  as.POSIXct(
    x_as_timestamp,
    origin = "1970-01-01",
    tz = "UTC"
  );
x_as_date
```

generic_recoding   *Generic underlying recoding function*

Description

This function contains the general set of actions that are always used when recoding a source (e.g. check the input, document the justification, etc). Users should normally never call this function.

Usage

```
generic_recoding(
  input,
  codes,
  func,
  filenameRegex = ".*",
  filter = TRUE,
  output = NULL,
  outputPrefix = "",
  outputSuffix = "_recoded",
  decisionLabel = NULL,
  justification = NULL,
  justificationFile = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent"),
  ...
)
```

Arguments

input   One of 1) a character string specifying the path to a file with a source; 2) an object with a loaded source as produced by a call to [load_source()](); 3) a character string specifying the path to a directory containing one or more sources; 4) or an object with a list of loaded sources as produced by a call to [load_sources()]().

codes   The codes to process

func   The function to apply.

filenameRegex   Only process files matching this regular expression.

filter   Optionally, a filter to apply to specify a subset of the source(s) to process (see [get_source_filter()]()).

output   If specified, the coded source will be written here.

outputPrefix, outputSuffix

                  The prefix and suffix to add to the filenames when writing the processed files to disk, in case multiple sources are passed as input.

decisionLabel   A description of the (recoding) decision that was taken.

justification   The justification for this action.

justificationFile

> If specified, the justification is appended to this file. If not, it is saved to the `justifier::workspace()`. This can then be saved or displayed at the end of the R Markdown file or R script using `justifier::save_workspace()`.

preventOverwriting

> Whether to prevent overwriting existing files when writing the files to `output`.

encoding   The encoding to use.

silent   Whether to be chatty or quiet.

...   Other arguments to pass to `fnc`.

Value

Invisibly, the recoded source(s) or source(s) object.

---

get_childCodeIds   *Get the code identifiers a code's descendents*

Description

Get the code identifiers of all children, or all descendents (i.e. including grand-children, grand-grand-children, etc) of a code with a given identifier.

Usage

```
get_childCodeIds(
  x,
  parentCodeId,
  returnNodes = FALSE,
  includeParentCode = FALSE
)

get_descendentCodeIds(x, parentCodeId, includeParentCode = FALSE)
```

Arguments

x   The parsed sources object

parentCodeId   The code identifier of the parent code

returnNodes   For `get_childCodeIds()`, set this to `TRUE` to return a list of nodes, not just the code identifiers.

includeParentCode

> Whether to include the parent code identifier in the result

Value

A character vector with code identifiers (or a list of nodes)

---

get_dataframe_from_nested_list

Return all values from a nested list in a dataframe

Description

Return all values from a nested list in a dataframe

Usage

```
get_dataframe_from_nested_list(x, nestingIn = "children")
```

Arguments

x	The nested list
nestingIn	The name containing the nested lists

Value

A dataframe

Examples

```
nestedList <-
  list(
    id = "x",
    value = "value for x",
    children = list(
      list(
        id = "y",
        value = "value for y"
      ),
      list(
        id = "z",
        value = "value for z"
      )
    )
  );
str(nestedList);
get_dataframe_from_nested_list(nestedList);
```

---

get_source_filter *Create a filter to select utterances in a source*

Description

This function takes a character vector with regular expressions, a numeric vector with numeric indices, or a logical vector that is either as long as the source or has length 1; and then always returns a logical vector of the same length as the source.

Usage

```
get_source_filter(
  source,
  filter,
  ignore.case = TRUE,
  invert = FALSE,
  perl = TRUE,
  ...
)
```

Arguments

source	The source to produce the filter for.
filter	THe filtering criterion: a character vector with regular expressions, a numeric vector with numeric indices, or a logical vector that is either as long as the source or has length 1.
ignore.case	Whether to apply the regular expression case sensitively or not (see `base::grepl()`).
invert	Whether to invert the result or not (i.e. whether the filter specifies what you want to select (invert=FALSE) or what you don't want to select (invert=TRUE)).
perl	Whether the regular expression (if `filter` is a character vector) is a perl regular expression or not (see `base::grepl()`).
...	Any additional arguments are passed on to `base::grepl()`.

Value

A logical vector of the same length as the source.

get_state_transition_df

Get the state transition data frame

Description

Get the state transition data frame

Usage

```
get_state_transition_df(x)
```

Arguments

x   A state transition table as produced by a call to get_state_transition_table().

Value

A dataframe with columns fromState, toState, and nrOfTransitions.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "state-example-1.rock");

### Parse single example source
parsedExample <- rock::parse_source(exampleFile);

### Show the state transition probabilities
exampleTable <- rock::get_state_transition_table(
  parsedExample
);

exampleStateDf <- rock::get_state_transition_df(
  exampleTable
);
```

---

get_state_transition_dot

Get the state transition data frame

Description

Get the state transition data frame

Usage

```
get_state_transition_dot(x)
```

Arguments

x   A state transition table as produced by a call to get_state_transition_table().

Value

A dataframe with columns fromState, toState, and nrOfTransitions.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "state-example-1.rock");

### Parse single example source
parsedExample <- rock::parse_source(exampleFile);

### Show the state transition probabilities
exampleTable <- rock::get_state_transition_table(
  parsedExample
);

exampleStateDf <- rock::get_state_transition_df(
  exampleTable
);

exampleDotCode <- rock::get_state_transition_dot(
  exampleStateDf
);

DiagrammeR::grViz(exampleDotCode);
```

---

get_state_transition_table

Get the state transition table

Description

Get the state transition table

Usage

```
get_state_transition_table(x, classIdentifier = "state")
```

Arguments

x   A parsed source document as provided by [parse_source()](#).

classIdentifier

The identifier of the class that has the states to looks at.

Value

A table, with the 'from' states as rows and the 'to' states as columns

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "state-example-1.rock");

### Parse single example source
parsedExample <- rock::parse_source(exampleFile);

### Show the state transition probabilities
rock::get_state_transition_table(
  parsedExample
);
```

get_utterances_and_codes_from_source

Get utterances and codes from source

Description

This is a convenience function to use when displaying a source. It returns an object with the raw and clean utterances in a source, as well as the utterance identifiers and a list with vectors of the codes for each utterance.

Usage

```
get_utterances_and_codes_from_source(x, ...)
```

Arguments

x	Either the result of a call to parse_source(), or a path or text to pass to parse_source().
...	Arguments to parse_source(), which is called to parse the source.

Value

A list containing $utterances_raw, $utterances_clean, $uids$, $codeMatches, and $codesPerUtterance.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Parse single example source
res <-
  rock::get_utterances_and_codes_from_source(
    exampleFile
  );
```

---

get_vectors_from_nested_list

Return one or more values from a nested list in a list of vectors

---

Description

Return one or more values from a nested list in a list of vectors

Usage

```
get_vectors_from_nested_list(x, valuesIn = NULL, nestingIn = "children")
```

Arguments

x	The nested list
valuesIn	The names holding the values to return (in vectors)
nestingIn	The name containing the nested lists

Value

A list of vectors.

Examples

```
nestedList <-
  list(
    id = "x",
    value = "value for x",
    children = list(
      list(
        id = "y",
        value = "value for y"
      ),
      list(
        id = "z",
        value = "value for z"
      )
    )
  );
str(nestedList);
get_vectors_from_nested_list(
  nestedList,
  c("id", "value")
);
```

---

heading *Print a heading*

Description

This is just a convenience function to print a markdown or HTML heading at a given 'depth'.

Usage

```
heading(
  ...,
  headingLevel = rock::opts$get("defaultHeadingLevel"),
  output = "markdown",
  cat = TRUE
)
```

Arguments

`...`	The heading text: pasted together with no separator.
`headingLevel`	The level of the heading; the default can be set with e.g. `rock::opts$set(defaultHeadingLevel=1)`.
`output`	Whether to output to HTML (`"html"`) or markdown (anything else).
`cat`	Whether to cat (print) the heading or just invisibly return it.

Value

The heading, invisibly.

Examples

```
heading("Hello ", "World", headingLevel=5);
### This produces: "\n\n##### Hello World\n\n"
```

---

heatmap_basic *Generic convenience function to create a heatmap*

Description

Generic convenience function to create a heatmap

Usage

```
heatmap_basic(
  data,
  x,
  y,
  fill,
  xLab = x,
  yLab = y,
  fillLab = fill,
  plotTitle = "Heatmap",
  fillScale = ggplot2::scale_fill_viridis_c(),
  theme = ggplot2::theme_minimal()
)
```

Arguments

`data`	A data frame
`x, y, fill`	The variables (columns) in `data` to use for the x axis, y axis, and fill of the heatmap, respectively.
`xLab, yLab, fillLab`	
	The labels to use for the x axis, y axis, and fill, respectively
`plotTitle`	The plot title.
`fillScale`	The fill scale.
`theme`	The theme.

Value

The heatmap, as a ggplot2 object.

Examples

```
rock::heatmap_basic(mtcars, 'am', 'cyl', 'mpg');
```

---

inspect_coded_sources *Read sources from a directory, parse them, and show coded fragments and code tree*

Description

This function combines successive calls to `parse_sources()`, `collect_coded_fragments()` and `show_inductive_code_tree()`.

Usage

```
inspect_coded_sources(
  path,
  parse_args = list(extension = "rock|dct", regex = NULL, recursive = TRUE,
    ignoreOddDelimiters = FALSE, encoding = rock::opts$get("encoding"), silent =
    rock::opts$get("silent")),
  fragments_args = list(codes = ".*", context = 0),
  inductive_tree_args = list(codes = ".*", output = "both", headingLevel = 3),
  deductive_tree_args = list()
)
```

Arguments

path	The path containing the sources to parse and inspect.
parse_args	The arguments to pass to parse_sources().
fragments_args	The arguments to pass to collect_coded_fragments().
inductive_tree_args	
	The arguments to pass to show_inductive_code_tree().
deductive_tree_args	
	Not yet implemented.

Value

The parsedSources object.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Inspect a selection of example sources - this takes too long
### to test, so hence the 'donttest' directive.

rock::inspect_coded_sources(
  examplePath,
  parse_args = list(regex = "test(.txt|.rock)")
);
```

---

load_source   *Load a source from a file or a string*

Description

These functions load one or more source(s) from a file or a string and store it in memory for further processing. Note that you'll probably want to clean the sources first, using one of the clean_sources() functions, and you'll probably want to add utterance identifiers to each utterance using one of the prepending_uids() functions.

Usage

```
load_source(
  input,
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent"),
  rlWarn = rock::opts$get(rlWarn),
  diligentWarnings = rock::opts$get("diligentWarnings")
)

load_sources(
  input,
  filenameRegex = ".*",
  ignoreRegex = NULL,
  recursive = TRUE,
  full.names = FALSE,
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

Arguments

input	The filename or contents of the source for `load_source` and the directory containing the sources for `load_sources`.
encoding	The encoding of the file(s).
silent	Whether to be chatty or quiet.
rlWarn	Whether to let [readLines()](#) warn, e.g. if files do not end with a newline character.
diligentWarnings	
	Whether to display very diligent warnings.
filenameRegex	A regular expression to match against located files; only files matching this regular expression are processed.
ignoreRegex	Regular expression indicating which files to ignore. This is a perl-style regular expression (see [base::regex](#)).
recursive	Whether to search all subdirectories (`TRUE`) as well or not.
full.names	Whether to store source names as filenames only or whether to include paths.

Value

Invisibly, an R character vector of classes `rock_source` and `character`.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
```

```
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Parse single example source
loadedSource <- rock::load_source(exampleFile);
```

---

mask_source   *Masking sources*

Description

These functions can be used to mask a set of utterances or one or more sources.

Usage

```
mask_source(
  input,
  output = NULL,
  proportionToMask = 1,
  preventOverwriting = rock::opts$get(preventOverwriting),
  encoding = rock::opts$get(encoding),
  rlWarn = rock::opts$get(rlWarn),
  maskRegex = "[[:alnum:]]",
  maskChar = "X",
  perl = TRUE,
  silent = rock::opts$get(silent)
)

mask_sources(
  input,
  output,
  proportionToMask = 1,
  outputPrefix = "",
  outputSuffix = "_masked",
  maskRegex = "[[:alnum:]]",
  maskChar = "X",
  perl = TRUE,
  recursive = TRUE,
  filenameRegex = ".*",
  filenameReplacement = c("_PRIVATE_", "_public_"),
  preventOverwriting = rock::opts$get(preventOverwriting),
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)

mask_utterances(
  input,
```

```
    proportionToMask = 1,
    maskRegex = "[[:alnum:]]",
    maskChar = "X",
    perl = TRUE
)
```

Arguments

input	For mask_utterance, a character vector where each element is one utterance; for mask_source, either a character vector containing the text of the relevant source *or* a path to a file that contains the source text; for mask_sources, a path to a directory that contains the sources to mask.
output	For mask_source, if not NULL, this is the name (and path) of the file in which to save the processed source (if it *is* NULL, the result will be returned visibly). For mask_sources, output is mandatory and is the path to the directory where to store the processed sources. This path will be created with a warning if it does not exist. An exception is if "same" is specified - in that case, every file will be written to the same directory it was read from.
proportionToMask	
	The proportion of utterances to mask, from 0 (none) to 1 (all).
preventOverwriting	
	Whether to prevent overwriting of output files.
encoding	The encoding of the source(s).
rlWarn	Whether to let readLines() warn, e.g. if files do not end with a newline character.
maskRegex	A regular expresssion (regex) specifying the characters to mask (i.e. replace with the masking character).
maskChar	The character to replace the character to mask with.
perl	Whether the regular expression is a perl regex or not.
silent	Whether to suppress the warning about not editing the cleaned source.
outputPrefix, outputSuffix	
	The prefix and suffix to add to the filenames when writing the processed files to disk.
recursive	Whether to search all subdirectories (TRUE) as well or not.
filenameRegex	A regular expression to match against located files; only files matching this regular expression are processed.
filenameReplacement	
	A character vector with two elements that represent, respectively, the pattern and replacement arguments of the gsub() function. In other words, the first argument specifies a regular expression to search for in every processed filename, and the second argument specifies a regular expression that replaces any matches with the first argument. Set to NULL to not perform any replacement on the output file name.

Value

A character vector for mask_utterance and mask_source, or a list of character vectors, for mask_sources.

Examples

```
### Mask text but not the codes
rock::mask_utterances(
  paste0(
    "Lorem ipsum dolor sit amet, consectetur adipiscing ",
    "elit. [[expAttitude_expectation_73dnt5z1>earplugsFeelUnpleasant]]"
  )
)
```

---

match_consecutive_delimiters

Match the corresponding indices of (YAML) delimiters in a sequential list

---

Description

This is just a convenience function that takes a vector of deliminaters and returns a list of delimiter pairs.

Usage

```
match_consecutive_delimiters(
  x,
  errorOnInvalidX = FALSE,
  errorOnOdd = FALSE,
  onOddIgnoreFirst = FALSE
)
```

Arguments

x   The vector with delimiter indices

errorOnInvalidX

                Whether to return NA (if FALSE) or throw an error (if TRUE) when x is NULL, NA, or has less than 2 elements.

errorOnOdd   Whether to throw an error if the number of delimiter indices is odd.

onOddIgnoreFirst

                If the number of delimiter indices is odd and no error is thrown, whether to ignore the first (TRUE) or the last (FALSE) delimiter.

Value

A list where each element is a two-element vector with the two consecutive delimiters

Examples

```
rock::match_consecutive_delimiters(
  c(1, 3, 5, 10, 19, 25, 30, 70)
);

exampleText <- c(
  "some text",
  "delimiter",
  "more text",
  "delimiter",
  "filler text",
  "intentionally left blank",
  "delimiter",
  "final text",
  "delimiter"
);

rock::match_consecutive_delimiters(
  grep(
    "delimiter",
    exampleText
  )
);
```

---

merge_sources   *Merge source files by different coders*

Description

This function takes sets of sources and merges them using the utterance identifiers (UIDs) to match them.

Usage

```
merge_sources(
  input,
  output,
  outputPrefix = "",
  outputSuffix = "_merged",
  primarySourcesRegex = ".*",
  primarySourcesIgnoreRegex = outputSuffix,
  primarySourcesPath = input,
  recursive = TRUE,
  primarySourcesRecursive = recursive,
  filenameRegex = ".*",
  primarySourcesFileList = NULL,
  sourcesFileList = NULL,
  postponeDeductiveTreeBuilding = TRUE,
```

```
    ignoreOddDelimiters = FALSE,
    preventOverwriting = rock::opts$get(preventOverwriting),
    encoding = rock::opts$get(encoding),
    silent = rock::opts$get(silent),
    inheritSilence = FALSE
)
```

Arguments

input	The directory containing the input sources.
output	The path to the directory where to store the merged sources. This path will be created with a warning if it does not exist. An exception is if `"same"` is specified - in that case, every file will be written to the same directory it was read from.
outputPrefix, outputSuffix	
	A pre- and/or suffix to add to the filename when writing the merged sources (especially useful when writing them to the same directory).
primarySourcesRegex	
	A regular expression that specifies how to recognize the primary sources (i.e. the files used as the basis, to which the codes from other sources are added).
primarySourcesIgnoreRegex	
	A regular expression that specifies which files to ignore as primary files.
primarySourcesPath	
	The path containing the primary sources.
recursive, primarySourcesRecursive	
	Whether to read files from sub-directories (`TRUE`) or not.
filenameRegex	Only files matching this regular expression are read.
primarySourcesFileList, sourcesFileList	
	Alternatively to using regular expressions, lists of full paths and filenames to the primary sources and all sources to process can be specified using these arguments. If this is used, neither can be `NULL`.
postponeDeductiveTreeBuilding	
	Whether to imediately try to build the deductive tree(s) based on the information in this file (`FALSE`) or whether to skip that. Skipping this is useful if the full tree information is distributed over multiple files (in which case you should probably call `parse_sources` instead of `parse_source`).
ignoreOddDelimiters	
	If an odd number of YAML delimiters is encountered, whether this should result in an error (`FALSE`) or just be silently ignored (`TRUE`).
preventOverwriting	
	Whether to prevent overwriting existing files or not.
encoding	The encoding of the file to read (in `file`).
silent	Whether to provide (`FALSE`) or suppress (`TRUE`) more detailed progress updates.
inheritSilence	If not silent, whether to let functions called by `merge_sources` inherit that setting.

Value

Invisibly, a list of the parsed, primary, and merged sources.

---

number_as_xl_date   *Convert a number to a date using Excel's system*

Description

Convert a number to a date using Excel's system

Usage

```
number_as_xl_date(x)
```

Arguments

x   The number(s)

Value

The date(s)

Examples

```
preregr::number_as_xl_date(44113);
```

---

opts   *Options for the rock package*

Description

The `rock::opts` object contains three functions to set, get, and reset options used by the rock package. Use `rock::opts$set` to set options, `rock::opts$get` to get options, or `rock::opts$reset` to reset specific or all options to their default values.

Usage

```
opts
```

Format

An object of class `list` of length 4.

Details

It is normally not necessary to get or set rock options. The defaults implement the Reproducible Open Coding Kit (ROCK) standard, and deviating from these defaults therefore means the processed sources and codes are not compatible and cannot be processed by other software that implements the ROCK. Still, in some cases this degree of customization might be desirable.

The following arguments can be passed:

... For `rock::opts$set`, the dots can be used to specify the options to set, in the format `option = value`, for example, `utteranceMarker = "\n"`. For `rock::opts$reset`, a list of options to be reset can be passed.

option For `rock::opts$set`, the name of the option to set.

default For `rock::opts$get`, the default value to return if the option has not been manually specified.

Some of the options that can be set (see `rock::opts$defaults` for the full list):

codeRegexes A named character vector with one or more regular expressions that specify how to extract the codes (that were used to code the sources). These regular expressions *must* each contain one capturing group to capture the codes.

idRegexes A named character vector with one or more regular expressions that specify how to extract the different types of identifiers. These regular expressions *must* each contain one capturing group to capture the identifiers.

sectionRegexes A named character vector with one or more regular expressions that specify how to extract the different types of sections.

autoGenerateIds The names of the `idRegexes` that, if missing, should receive autogenerated identifiers (which consist of 'autogenerated_' followed by an incrementing number).

noCodes This regular expression is matched with all codes after they have been extracted using the `codeRegexes` regular expression (i.e. they're matched against the codes themselves without, for example, the square brackets in the default code regex). Any codes matching this `noCodes` regular expression will be **ignored**, i.e., removed from the list of codes.

inductiveCodingHierarchyMarker For inductive coding, this marker is used to indicate hierarchical relationships between codes. The code at the left hand side of this marker will be considered the parent code of the code on the right hand side. More than two levels can be specified in one code (for example, if the `inductiveCodingHierarchyMarker` is '>', the code `grandparent>child>grandchild` would indicate codes at three levels.

attributeContainers The name of YAML fragments containing case attributes (e.g. metadata, demographic variables, quantitative data about cases, etc).

codesContainers The name of YAML fragments containing (parts of) deductive coding trees.

delimiterRegEx The regular expression that is used to extract the YAML fragments.

codeDelimiters A character vector of two elements specifying the opening and closing delimiters of codes (conform the default ROCK convention, two square brackets). The square brackets will be escaped; other characters will not, but will be used as-is.

ignoreRegex The regular expression that is used to delete lines before any other processing. This can be used to enable adding comments to sources, which are then ignored during analysis.

includeBootstrap Whether to include the default bootstrap CSS.

utteranceMarker How to specify breaks between utterances in the source(s). The ROCK convention is to use a newline (\\n).

coderId A regular expression specifying the coder identifier, specified similarly to the codeRegexes.

idForOmittedCoderIds The identifier to use for utterances that do not have a coder id (i.e. utterance that occur in a source that does not specify a coder id, or above the line where a coder id is specified).

Examples

```
### Get the default utteranceMarker
rock::opts$get(utteranceMarker);

### Set it to a custom version, so that every line starts with a pipe
rock::opts$set(utteranceMarker = "\n|");

### Check that it worked
rock::opts$get(utteranceMarker);

### Reset this option to its default value
rock::opts$reset(utteranceMarker);

### Check that the reset worked, too
rock::opts$get(utteranceMarker);
```

---

parsed_sources_to_ena_network
                          Create an ENA network out of one or more parsed sources

---

Description

Create an ENA network out of one or more parsed sources

Usage

```
parsed_sources_to_ena_network(
  x,
  unitCols,
  conversationCols = "originalSource",
  codes = x$convenience$codingLeaves,
  metadata = x$convenience$attributesVars
)
```

Arguments

x	The parsed source(s) as provided by `rock::parse_source` or `rock::parse_sources`.
unitCols	The columns that together define units (e.g. utterances in each source that belong together, for example because they're about the same topic).
conversationCols	
	The columns that together define conversations (e.g. separate sources, but can be something else, as well).
codes	The codes to include; by default, takes all codes.
metadata	The columns in the merged source dataframe that contain the metadata. By default, takes all read metadata.

Value

The result of a call to `rENA::ena.plot.network()`, if that is installed.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Parse a selection of example sources in that directory
parsedExamples <-
  rock::parse_sources(
    examplePath,
    regex = "(test|example)(.txt|.rock)"
  );

### Add something to indicate which units belong together; normally,
### these would probably be indicated using one of the identifier,
### for example the stanza identifiers, the sid's
nChunks <- nrow(parsedExamples$mergedSourceDf) %/% 10;
parsedExamples$mergedSourceDf$units <-
 c(rep(1:nChunks, each=10), rep(max(nChunks), nrow(parsedExamples$mergedSourceDf) - (10*nChunks)));

### Generate ENA plot

enaPlot <-
  rock::parsed_sources_to_ena_network(parsedExamples,
                                      unitCols='units');

### Show the resulting plot
print(enaPlot);
```

---

parse_source   *Parsing sources*

Description

These function parse one (parse_source) or more (parse_sources) sources and the contained
identifiers, sections, and codes.

Usage

```
parse_source(
  text,
  file,
  utteranceLabelRegexes = NULL,
  ignoreOddDelimiters = FALSE,
  checkClassInstanceIds = rock::opts$get(checkClassInstanceIds),
  postponeDeductiveTreeBuilding = FALSE,
  filesWithYAML = NULL,
  removeSectionBreakRows = rock::opts$get("removeSectionBreakRows"),
  removeIdentifierRows = rock::opts$get("removeIdentifierRows"),
  removeEmptyRows = rock::opts$get("removeEmptyRows"),
  rlWarn = rock::opts$get("rlWarn"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)

## S3 method for class 'rock_parsedSource'
print(x, prefix = "### ", ...)

parse_sources(
  path,
  extension = "rock|dct",
  regex = NULL,
  recursive = TRUE,
  removeSectionBreakRows = rock::opts$get("removeSectionBreakRows"),
  removeIdentifierRows = rock::opts$get("removeIdentifierRows"),
  removeEmptyRows = rock::opts$get("removeEmptyRows"),
  ignoreOddDelimiters = FALSE,
  checkClassInstanceIds = rock::opts$get(checkClassInstanceIds),
  mergeInductiveTrees = FALSE,
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)

## S3 method for class 'rock_parsedSources'
print(x, prefix = "### ", ...)
```

```
## S3 method for class 'rock_parsedSources'
plot(x, ...)
```

Arguments

text, file   As text or file, you can specify a file to read with encoding encoding, which will then be read using [base::readLines()](). If the argument is named text, whether it is the path to an existing file is checked first, and if it is, that file is read. If the argument is named file, and it does not point to an existing file, an error is produced (useful if calling from other functions). A text should be a character vector where every element is a line of the original source (like provided by [base::readLines()]()); although if a character vector of one element *and* including at least one newline character (\\n) is provided as text, it is split at the newline characters using [base::strsplit()](). Basically, this behavior means that the first argument can be either a character vector or the path to a file; and if you're specifying a file and you want to be certain that an error is thrown if it doesn't exist, make sure to name it file.

utteranceLabelRegexes

Optionally, a list with two-element vectors to preprocess utterances before they are stored as labels (these 'utterance perl regular expression!

ignoreOddDelimiters

If an odd number of YAML delimiters is encountered, whether this should result in an error (FALSE) or just be silently ignored (TRUE).

checkClassInstanceIds

Whether to check for the occurrence of class instance identifiers specified in the attributes.

postponeDeductiveTreeBuilding

Whether to imediately try to build the deductive tree(s) based on the information in this file (FALSE) or whether to skip that. Skipping this is useful if the full tree information is distributed over multiple files (in which case you should probably call parse_sources instead of parse_source).

filesWithYAML   Any additional files to process to look for YAML fragments.

removeSectionBreakRows, removeIdentifierRows, removeEmptyRows

Whether to remove from the QDT, respectively: rows containing section breaks; rows containing only (class instance) identifiers; and empty rows.

rlWarn   Whether to let [readLines()]() warn, e.g. if files do not end with a newline character.

encoding   The encoding of the file to read (in file).

silent   Whether to provide (FALSE) or suppress (TRUE) more detailed progress updates.

x   The object to print.

prefix   The prefix to use before the 'headings' of the printed result.

...   Any additional arguments are passed on to the default print method.

path   The path containing the files to read.

extension   The extension of the files to read; files with other extensions will be ignored. Multiple extensions can be separated by a pipe (|).

regex   Instead of specifing an extension, it's also possible to specify a regular expression; only files matching this regular expression are read. If specified, `regex` takes precedece over `extension`,

recursive   Whether to also process subdirectories (TRUE) or not (FALSE).

mergeInductiveTrees

                   Merge multiple inductive code trees into one; this functionality is currently not yet implemented.

Value

For `rock::parse_source()`, an object of class `rock_parsedSource`; for `rock::parse_sources()`, an object of class `rock_parsedSources`. These objects contain the original source(s) as well as the final data frame with utterances and codes, as well as the code structures.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Parse single example source
parsedExample <- rock::parse_source(exampleFile);

### Show inductive code tree for the codes
### extracted with the regular expression specified with
### the name 'codes':
parsedExample$inductiveCodeTrees$codes;

### If you want `rock` to be chatty, use:
parsedExample <- rock::parse_source(exampleFile,
                                    silent=FALSE);

### Parse as selection of example sources in that directory
parsedExamples <-
  rock::parse_sources(
    examplePath,
    regex = "(test|example)(.txt|.rock)"
  );

### Show combined inductive code tree for the codes
### extracted with the regular expression specified with
### the name 'codes':
parsedExamples$inductiveCodeTrees$codes;

### Show a souce coded with the Qualitative Network Approach
qnaExample <-
  rock::parse_source(
```

```
    file.path(
      examplePath,
      "network-example-1.rock"
    )
  );
```

---

parse_source_by_coderId

Parsing sources separately for each coder

Description

Parsing sources separately for each coder

Usage

```
parse_source_by_coderId(
  input,
  ignoreOddDelimiters = FALSE,
  postponeDeductiveTreeBuilding = TRUE,
  rlWarn = rock::opts$get(rlWarn),
  encoding = "UTF-8",
  silent = TRUE
)

parse_sources_by_coderId(
  input,
  recursive = TRUE,
  filenameRegex = ".*",
  ignoreOddDelimiters = FALSE,
  postponeDeductiveTreeBuilding = TRUE,
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)
```

Arguments

input
: For `parse_source_by_coderId`, either a character vector containing the text of the relevant source *or* a path to a file that contains the source text; for `parse_sources_by_coderId`, a path to a directory that contains the sources to parse.

ignoreOddDelimiters
: If an odd number of YAML delimiters is encountered, whether this should result in an error (`FALSE`) or just be silently ignored (`TRUE`).

postponeDeductiveTreeBuilding
: Whether to imediately try to build the deductive tree(s) based on the information in this file (`FALSE`) or whether to skip that. Skipping this is useful if the full tree

	information is distributed over multiple files (in which case you should probably call parse_sources instead of parse_source).
rlWarn	Whether to let readLines() warn, e.g. if files do not end with a newline character.
encoding	The encoding of the file to read (in file).
silent	Whether to provide (FALSE) or suppress (TRUE) more detailed progress updates.
recursive	Whether to search all subdirectories (TRUE) as well or not.
filenameRegex	A regular expression to match against located files; only files matching this regular expression are processed.

Value

For rock::parse_source_by_coderId(), an object of class rock_parsedSource; for rock::parse_sources_by_coderId
an object of class rock_parsedSources. These objects contain the original source(s) as well as the
final data frame with utterances and codes, as well as the code structures.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Parse single example source
parsedExample <- rock::parse_source_by_coderId(exampleFile);
```

---

prepend_ids_to_source   *Prepending unique utterance identifiers*

Description

This function prepends unique utterance identifiers to each utterance (line) in a source. Note that
you'll probably want to clean the sources using clean_sources() first.

Usage

```
prepend_ids_to_source(
  input,
  output = NULL,
  origin = Sys.time(),
  rlWarn = rock::opts$get(rlWarn),
  preventOverwriting = rock::opts$get(preventOverwriting),
  encoding = rock::opts$get(encoding),
```

```
  silent = rock::opts$get(silent)
)

prepend_ids_to_sources(
  input,
  output = NULL,
  outputPrefix = "",
  outputSuffix = "_withUIDs",
  origin = Sys.time(),
  preventOverwriting = rock::opts$get(preventOverwriting),
  encoding = rock::opts$get(encoding),
  silent = rock::opts$get(silent)
)
```

Arguments

input	The filename or contents of the source for prepend_ids_to_source and the directory containing the sources for prepend_ids_to_sources.
output	The filename where to write the resulting file for prepend_ids_to_source and the directory where to write the resulting files for prepend_ids_to_sources
origin	The time to use for the first identifier.
rlWarn	Whether to let readLines() warn, e.g. if files do not end with a newline character.
preventOverwriting	
	Whether to overwrite existing files (FALSE) or prevent that from happening (TRUE).
encoding	The encoding of the file(s).
silent	Whether to be chatty or quiet.
outputPrefix, outputSuffix	
	The prefix and suffix to add to the filenames when writing the processed files to disk.

Value

The source with prepended uids, either invisible (if output if specified) or visibly (if not).

Examples

```
### Simple example
rock::prepend_ids_to_source(
  "brief\nexample\nsource"
);

### Example including fake YAML fragments
longerExampleText <-
  c(
    "---",
    "First YAML fragment",
```

```
  "---",
  "So this is an utterance (i.e. outside of YAML)",
  "This, too.",
  "---",
  "Second fragment",
  "---",
  "Another real utterance outside of YAML",
  "Another one outside",
  "Last 'real utterance'"
);

rock::prepend_ids_to_source(
  longerExampleText
);
```

---

prereg_initialize   *Initialize a (pre)registration*

Description

To initialize a (pre)registration, pass the URL to a Google Sheet holding the (pre)registration form specification (in {preregr} format), see the "Creating a form from a spreadsheet" vignette), the path to a file with a spreadsheet holding such a specification, or a loaded or imported {preregr} (pre)registration form.

Usage

```
prereg_initialize(x, initialText = "Unspecified")
```

Arguments

x	The (pre)registration form specification, as a URL to a Google Sheet or online file or as the path to a locally stored file.
initialText	The text to initialize every field with.

Details

For an introduction to working with {preregr} (pre)registrations, see the "Specifying preregistration content" vignette.

Value

The empty (pre)registration specification.

Examples

```
rock::prereg_initialize(
  "preregQE_v0_95"
);
```

---

print.rock_graphList   *Plot the graphs in a list of graphs*

Description

Plot the graphs in a list of graphs

Usage

```
## S3 method for class 'rock_graphList'
print(x, ...)
```

Arguments

x   The list of graphs

...   Any other arguments are passed to [DiagrammeR::render_graph()](#).

Value

x, invisibly

---

qna_to_tlm   *Convert a QNA network to Linear Topic Map format*

Description

The Linear Topic Map format, LTM (<https://ontopia.net/download/ltm.html>), allows specification of networks in a human-readable format.

Usage

```
qna_to_tlm(
  x,
  topicmapId = "rock_qna_topicmap",
  topicmapTitle = "A ROCK QNA Topic Map"
)
```

Arguments

x   The parsed source object (as produced by [parse_source()](#)), or an object holding multiple parsed sources (as produced by [parse_sources()](#)).

topicmapId, topicmapTitle
                 The topic map's identifier and title.

Value

If x is a single parsed source: a character vector holding the Linear Topic Map specification; or, if multiple network coding schemes were used in parallel, each in a list. If x contains multiple parseds sources, a list of such objects (i.e., a list of vectors, or a list of lists of vectors).

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Read a souce coded with the Qualitative Network Approach
qnaExample <-
  rock::parse_source(
    file.path(
      examplePath,
      "network-example-1.rock"
    )
  );

### Convert and show the topic map
cat(
  rock::qna_to_tlm(
    qnaExample
  ),
  sep="\n"
);
```

---

rbind_dfs   *Simple alternative for rbind.fill or bind_rows*

Description

Simple alternative for rbind.fill or bind_rows

Usage

```
rbind_dfs(x, y, clearRowNames = TRUE)
```

Arguments

x	One dataframe
y	Another dataframe
clearRowNames	Whether to clear row names (to avoid duplication)

Value

The merged dataframe

Examples

```
rbind_dfs(Orange, mtcars);
```

---

rbind_df_list	*Bind lots of dataframes together rowwise*

Description

Bind lots of dataframes together rowwise

Usage

```
rbind_df_list(x)
```

Arguments

x   A list of dataframes

Value

A dataframe

Examples

```
rbind_df_list(list(Orange, mtcars, ChickWeight));
```

---

read_spreadsheet	*Convenience function to read spreadsheet-like files*

Description

Currently reads spreadsheets from Google Sheets or from `xlsx`, `csv`, or `sav` files.

Usage

```
read_spreadsheet(
  x,
  sheet = NULL,
  columnDictionary = NULL,
  localBackup = NULL,
  exportGoogleSheet = FALSE,
  flattenSingleDf = FALSE,
  xlsxPkg = c("rw_xl", "openxlsx", "XLConnect"),
  failQuietly = FALSE,
  silent = rock::opts$get("silent")
)
```

Arguments

x	The URL or path to a file.
sheet	Optionally, the name(s) of the worksheet(s) to select.
columnDictionary	
	Optionally, a dictionary with column names to check for presence. A named list of vectors.
localBackup	If not NULL, a valid filename to write a local backup to.
exportGoogleSheet	
	If x is a URL to a Google Sheet, instead of using the googlesheets4 package to download the data, by passing exportGoogleSheet=TRUE, an export link will be produced and the data will be downloaded as Excel spreadsheet.
flattenSingleDf	
	Whether to return the result as a data frame if only one data frame is returned as a result.
xlsxPkg	Which package to use to work with Excel spreadsheets.
failQuietly	Whether to give an error when x is not a valid URL or existing file, or just return NULL invisibly.
silent	Whether to be silent or chatty.

Value

A list of dataframes, or, if only one data frame was loaded and flattenSingleDf is TRUE, a data frame.

Examples

```
### This requires an internet connection!
## Not run:
read_spreadsheet(
  paste0(
    "https://docs.google.com/",
    "spreadsheets/d/",
    "1bHDzpCu4CwEa5_3_q_9vH2691XPhCS3e4Aj_HLhw_U8"
  )
);

## End(Not run)
```

---

recode_addChildCodes   *Add child codes under a parent code*

Description

This function conditionally adds new child codes under a code. Where recode_split() removes the original code (splitting it into the new codes), this function retains the original, adding the new codes as sub-codes.

Usage

```
recode_addChildCodes(
  input,
  codes,
  childCodes,
  filter = TRUE,
  output = NULL,
  filenameRegex = ".*",
  outputPrefix = "",
  outputSuffix = "_rcAdded",
  decisionLabel = NULL,
  justification = NULL,
  justificationFile = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

Arguments

input	One of 1) a character string specifying the path to a file with a source; 2) an object with a loaded source as produced by a call to `load_source()`; 3) a character string specifying the path to a directory containing one or more sources; 4) or an object with a list of loaded sources as produced by a call to `load_sources()`.
codes	A single character value with the code to add the child codes to.
childCodes	A named list with specifying when to add which child code. Each element of this list is a filtering criterion that will be passed on to `get_source_filter()` to create the actual filter that will be applied. The name of each element is the code that will be applied to utterances matching that filter. When calling recode_addChildCodes() for a single source, instead of passing the filtering criterion, it is also possible to pass a filter (i.e. the result of the call to `get_source_filter()`), which allows more finegrained control. Note that these 'child code filters' and the corresponding codes are processed sequentially in the order specified in childCodes. Any utterances coded with the code specified in codes that do not match with any of the 'child code filters' specified as the childCodes elements will remain unchanged. To create a catch-all ('else') category, pass ".*" or TRUE as a filter (see the example).
filter	Optionally, a filter to apply to specify a subset of the source(s) to process (see `get_source_filter()`).
output	If specified, the recoded source(s) will be written here.
filenameRegex	Only process files matching this regular expression.
outputPrefix, outputSuffix	
	The prefix and suffix to add to the filenames when writing the processed files to disk, in case multiple sources are passed as input.
decisionLabel	A description of the (recoding) decision that was taken.
justification	The justification for this action.

justificationFile

> If specified, the justification is appended to this file. If not, it is saved to the
> justifier::workspace(). This can then be saved or displayed at the end of
> the R Markdown file or R script using justifier::save_workspace().

preventOverwriting

> Whether to prevent overwriting existing files when writing the files to output.

encoding   The encoding to use.

silent   Whether to be chatty or quiet.

Value

Invisibly, the changed source(s) or source(s) object.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Load example source
loadedExampleSource <- rock::load_source(exampleFile);

### Split a code into two codes, showing progress (the backticks are
### used to be able to specify a name that starts with an underscore)
recoded_source <-
  rock::recode_addChildCodes(
    loadedExampleSource,
    codes="childCode1",
    childCodes = list(
      `_and_` = " and ",
      `_book_` = "book",
      `_else_` = TRUE
    ),
    silent=FALSE
  );
```

---

recode_delete   *Remove one or more codes*

Description

These functions remove one or more codes from a source, and make it easy to justify that decision.

Usage

```
recode_delete(
  input,
  codes,
  filter = TRUE,
  output = NULL,
  filenameRegex = ".*",
  outputPrefix = "",
  outputSuffix = "_rcDeleted",
  childrenReplaceParents = TRUE,
  recursiveDeletion = FALSE,
  decisionLabel = NULL,
  justification = NULL,
  justificationFile = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

Arguments

input	One of 1) a character string specifying the path to a file with a source; 2) an object with a loaded source as produced by a call to load_source(); 3) a character string specifying the path to a directory containing one or more sources; 4) or an object with a list of loaded sources as produced by a call to load_sources().
codes	A character vector with codes to remove.
filter	Optionally, a filter to apply to specify a subset of the source(s) to process (see get_source_filter()).
output	If specified, the recoded source(s) will be written here.
filenameRegex	Only process files matching this regular expression.
outputPrefix, outputSuffix	
	The prefix and suffix to add to the filenames when writing the processed files to disk, in case multiple sources are passed as input.
childrenReplaceParents	
	Whether children should be deleted (FALSE) or take their parent code's place (TRUE). This is ignored if recursiveDeletion=TRUE, in which case children are always deleted.
recursiveDeletion	
	Whether to also delete a code's parents (TRUE), if they have no other children, and keep doing this until the root is reached, or whether to leave parent codes alone (FALSE). This takes precedence over childrenReplaceParents.
decisionLabel	A description of the (recoding) decision that was taken.
justification	The justification for this action.
justificationFile	
	If specified, the justification is appended to this file. If not, it is saved to the justifier::workspace(). This can then be saved or displayed at the end of the R Markdown file or R script using justifier::save_workspace().

preventOverwriting

                  Whether to prevent overwriting existing files when writing the files to output.

encoding   The encoding to use.

silent   Whether to be chatty or quiet.

Value

Invisibly, the recoded source(s) or source(s) object.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Load example source
loadedExample <- rock::load_source(exampleFile);

### Delete two codes, moving children to the codes' parents
recoded_source <-
  rock::recode_delete(
    loadedExample,
    codes=c("childCode2", "childCode1"),
    silent=FALSE
  );

### Process an entire directory
list_of_recoded_sources <-
  rock::recode_delete(
    examplePath,
    codes=c("childCode2", "childCode1"),
    silent=FALSE
  );
```

---

recode_merge   *Merge two or more codes*

Description

This function merges two or more codes into one.

Usage

```
recode_merge(
  input,
  codes,
  mergeToCode,
  filter = TRUE,
  output = NULL,
  filenameRegex = ".*",
  outputPrefix = "",
  outputSuffix = "_rcMerged",
  decisionLabel = NULL,
  justification = NULL,
  justificationFile = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

Arguments

input	One of 1) a character string specifying the path to a file with a source; 2) an object with a loaded source as produced by a call to [load_source()](); 3) a character string specifying the path to a directory containing one or more sources; 4) or an object with a list of loaded sources as produced by a call to [load_sources()]().
codes	A character vector with the codes to merge.
mergeToCode	A single character vector with the merged code.
filter	Optionally, a filter to apply to specify a subset of the source(s) to process (see [get_source_filter()]()).
output	If specified, the recoded source(s) will be written here.
filenameRegex	Only process files matching this regular expression.
outputPrefix, outputSuffix	
	The prefix and suffix to add to the filenames when writing the processed files to disk, in case multiple sources are passed as input.
decisionLabel	A description of the (recoding) decision that was taken.
justification	The justification for this action.
justificationFile	
	If specified, the justification is appended to this file. If not, it is saved to the `justifier::workspace()`. This can then be saved or displayed at the end of the R Markdown file or R script using `justifier::save_workspace()`.
preventOverwriting	
	Whether to prevent overwriting existing files when writing the files to `output`.
encoding	The encoding to use.
silent	Whether to be chatty or quiet.

Value

Invisibly, the changed source(s) or source(s) object.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Load example source
loadedExample <- rock::load_source(exampleFile);

### Move two codes to a new parent, showing progress
recoded_source <-
  rock::recode_merge(
    loadedExample,
    codes=c("childCode2", "grandchildCode2"),
    mergeToCode="mergedCode",
    silent=FALSE
  );
```

---

recode_move   *Move one or more codes to a different parent*

Description

These functions move a code to a different parent (and therefore, ancestry) in one or more sources.

Usage

```
recode_move(
  input,
  codes,
  newAncestry,
  filter = TRUE,
  output = NULL,
  filenameRegex = ".*",
  outputPrefix = "",
  outputSuffix = "_rcMoved",
  decisionLabel = NULL,
  justification = NULL,
  justificationFile = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
```

```
    silent = rock::opts$get("silent")
)
```

Arguments

`input`	One of 1) a character string specifying the path to a file with a source; 2) an object with a loaded source as produced by a call to `load_source()`; 3) a character string specifying the path to a directory containing one or more sources; 4) or an object with a list of loaded sources as produced by a call to `load_sources()`.
`codes`	A character vector with codes to move.
`newAncestry`	The new parent code, optionally including the partial or full ancestry (i.e. the path of parent codes all the way up to the root).
`filter`	Optionally, a filter to apply to specify a subset of the source(s) to process (see `get_source_filter()`).
`output`	If specified, the recoded source(s) will be written here.
`filenameRegex`	Only process files matching this regular expression.
`outputPrefix, outputSuffix`	
	The prefix and suffix to add to the filenames when writing the processed files to disk, in case multiple sources are passed as input.
`decisionLabel`	A description of the (recoding) decision that was taken.
`justification`	The justification for this action.
`justificationFile`	
	If specified, the justification is appended to this file. If not, it is saved to the `justifier::workspace()`. This can then be saved or displayed at the end of the R Markdown file or R script using `justifier::save_workspace()`.
`preventOverwriting`	
	Whether to prevent overwriting existing files when writing the files to `output`.
`encoding`	The encoding to use.
`silent`	Whether to be chatty or quiet.

Value

Invisibly, the changed source(s) or source(s) object.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Load example source
loadedExample <- rock::load_source(exampleFile);
```

```
### Move two codes to a new parent, showing progress
recoded_source <-
  rock::recode_move(
    loadedExample,
    codes=c("childCode2", "childCode1"),
    newAncestry = "parentCode2",
    silent=FALSE
  );
```

---

recode_rename | *Rename one or more codes*

Description

These functions rename one or more codes in one or more sources.

Usage

```
recode_rename(
  input,
  codes,
  filter = TRUE,
  output = NULL,
  filenameRegex = ".*",
  outputPrefix = "",
  outputSuffix = "_rcRenamed",
  decisionLabel = NULL,
  justification = NULL,
  justificationFile = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

Arguments

input	One of 1) a character string specifying the path to a file with a source; 2) an object with a loaded source as produced by a call to load_source(); 3) a character string specifying the path to a directory containing one or more sources; 4) or an object with a list of loaded sources as produced by a call to load_sources().
codes	A named character vector with codes to rename. Each element should be the new code, and the element's name should be the old code (so e.g. codes = c(oldcode1 = 'newcode1', oldcode2 = 'newcode2')).
filter	Optionally, a filter to apply to specify a subset of the source(s) to process (see get_source_filter()).
output	If specified, the recoded source(s) will be written here.
filenameRegex	Only process files matching this regular expression.

outputPrefix, outputSuffix

> The prefix and suffix to add to the filenames when writing the processed files to disk, in case multiple sources are passed as input.

decisionLabel   A description of the (recoding) decision that was taken.

justification   The justification for this action.

justificationFile

> If specified, the justification is appended to this file. If not, it is saved to the `justifier::workspace()`. This can then be saved or displayed at the end of the R Markdown file or R script using `justifier::save_workspace()`.

preventOverwriting

> Whether to prevent overwriting existing files when writing the files to `output`.

encoding   The encoding to use.

silent   Whether to be chatty or quiet.

Value

Invisibly, the changed source(s) or source(s) object.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Load example source
loadedExample <- rock::load_source(exampleFile);

### Move two codes to a new parent, showing progress
recoded_source <-
  rock::recode_rename(
    loadedExample,
    codes=c(childCode2 = "grownUpCode2",
            grandchildCode2 = "almostChildCode2"),
    silent=FALSE
  );
```

---

recode_split   *Split a code into multiple codes*

Description

This function conditionally splits a code into multiple codes. Note that you may want to use [recode_addChildCodes()](#) instead to not lose the original coding.

Usage

```
recode_split(
  input,
  codes,
  splitToCodes,
  filter = TRUE,
  output = NULL,
  filenameRegex = ".*",
  outputPrefix = "",
  outputSuffix = "_recoded",
  decisionLabel = NULL,
  justification = NULL,
  justificationFile = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

Arguments

input	One of 1) a character string specifying the path to a file with a source; 2) an object with a loaded source as produced by a call to [load_source()]; 3) a character string specifying the path to a directory containing one or more sources; 4) or an object with a list of loaded sources as produced by a call to [load_sources()].
codes	A single character value with the code to split.
splitToCodes	A named list with specifying when to split to which new code. Each element of this list is a filtering criterion that will be passed on to [get_source_filter()] to create the actual filter that will be applied. The name of each element is the code that will be applied to utterances matching that filter. When calling recode_split() for a single source, instead of passing the filtering criterion, it is also possible to pass a filter (i.e. the result of the call to [get_source_filter()]), which allows more finegrained control. Note that these split filters and the corresponding codes are processed sequentially in the order specified in splitToCodes. This means that once an utterance that was coded with codes has been matched to one of these 'split filters' (and so, recoded with the corresponding 'split code', i.e., with the name of that split filter in splitToCodes), it will not be recoded again even if it also matches with other split filters down the line. Any utterances coded with the code to split up (i.e. specified in codes) that do not match with any of the split filters specified as the splitToCodes elements will not be recoded and so remain coded with codes. To create a catch-all ('else') category, pass ".*" or TRUE as a filter (see the example).
filter	Optionally, a filter to apply to specify a subset of the source(s) to process (see [get_source_filter()]).
output	If specified, the recoded source(s) will be written here.
filenameRegex	Only process files matching this regular expression.

outputPrefix, outputSuffix

> The prefix and suffix to add to the filenames when writing the processed files to disk, in case multiple sources are passed as input.

decisionLabel   A description of the (recoding) decision that was taken.

justification   The justification for this action.

justificationFile

> If specified, the justification is appended to this file. If not, it is saved to the justifier::workspace(). This can then be saved or displayed at the end of the R Markdown file or R script using justifier::save_workspace().

preventOverwriting

> Whether to prevent overwriting existing files when writing the files to output.

encoding   The encoding to use.

silent   Whether to be chatty or quiet.

Value

Invisibly, the changed source(s) or source(s) object.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Load example source
loadedExample <- rock::load_source(exampleFile);

### Split a code into two codes, showing progress
recoded_source <-
  rock::recode_split(
    loadedExample,
    codes="childCode1",
    splitToCodes = list(
      and_REPLACED = " and ",
      book_REPLACED = "book",
      else_REPLACED = TRUE
    ),
    silent=FALSE
  );
```

---

repeatStr   *Repeat a string a number of times*

Description

Repeat a string a number of times

Usage

```
repeatStr(n = 1, str = " ")
```

Arguments

n, str   Normally, respectively the frequency with which to repeat the string and the
                string to repeat; but the order of the inputs can be switched as well.

Value

A character vector of length 1.

Examples

```
### 10 spaces:
repStr(10);

### Three euro symbols:
repStr("\u20ac", 3);
```

---

resultsOverview_allCodedFragments
                          Show all coded fragments

Description

Show all coded fragments

Usage

```
resultsOverview_allCodedFragments(
  x,
  root = "codes",
  context = 0,
  heading = NULL,
  headingLevel = 2,
  add_html_tags = TRUE,
  cleanUtterances = FALSE,
```

```
    output = NULL,
    outputViewer = "viewer",
    template = "default",
    includeCSS = TRUE,
    includeBootstrap = rock::opts$get("includeBootstrap"),
    preventOverwriting = rock::opts$get(preventOverwriting),
    silent = rock::opts$get(silent)
)
```

Arguments

x	The parsed source(s) as provided by `rock::parse_source` or `rock::parse_sources`.
root	The root code
context	How many utterances before and after the target utterances to include in the fragments. If two values, the first is the number of utterances before, and the second, the number of utterances after the target utterances.
heading	Optionally, a title to include in the output. The title will be prefixed with `headingLevel` hashes (#), and the codes with `headingLevel+1` hashes. If `NULL` (the default), a heading will be generated that includes the collected codes if those are five or less. If a character value is specified, that will be used. To omit a heading, set to anything that is not `NULL` or a character vector (e.g. `FALSE`). If no heading is used, the code prefix will be `headingLevel` hashes, instead of `headingLevel+1` hashes.
headingLevel	The number of hashes to insert before the headings.
add_html_tags	Whether to add HTML tags to the result.
cleanUtterances	
	Whether to use the clean or the raw utterances when constructing the fragments (the raw versions contain all codes). Note that this should be set to `FALSE` to have `add_html_tags` be of the most use.
output	Here, a path and filename can be provided where the result will be written. If provided, the result will be returned invisibly.
outputViewer	If showing output, where to show the output: in the console (`outputViewer='console'`) or in the viewer (`outputViewer='viewer'`), e.g. the RStudio viewer. You'll usually want the latter when outputting HTML, and otherwise the former. Set to `FALSE` to not output anything to the console or the viewer.
template	The template to load; either the name of one of the ROCK templates (currently, only 'default' is available), or the path and filename of a CSS file.
includeCSS	Whether to include the ROCK CSS in the returned HTML.
includeBootstrap	
	Whether to include the default bootstrap CSS.
preventOverwriting	
	Whether to prevent overwriting of output files.
silent	Whether to provide (`FALSE`) or suppress (`TRUE`) more detailed progress updates.

Value

Invisibly, the coded fragments in a character vector.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(
    examplePath, "example-1.rock"
  );

### Parse single example source
parsedExample <-
  rock::parse_source(
    exampleFile
  );

### Show organised coded fragments in Markdown
cat(
  rock::resultsOverview_allCodedFragments(
    parsedExample
  )
);
```

---

rock   *rock: A Reproducible Open Coding Kit*

Description

This package implements an open standard for working with qualitative data, as such, it has two parts: a file format/convention and this R package that facilitates working with .rock files.

The ROCK File Format

The .rock files are plain text files where a number of conventions are used to add metadata. Normally these are the following conventions:

- The smallest 'codeable unit' is called an utterance, and utterances are separated by newline characters (i.e. every line of the file is an utterance);

- Codes are in between double square brackets: [[code1]] and [[code2]];

- Hierarchy in inductive code trees can be indicated using the greater than sign (>): [[parent1>child1]];

- Utterances can have unique identifiers called 'utterance identifiers' or 'UIDs', which are unique short alphanumeric strings placed in between double square brackets after 'uid:', e.g. [[uid:73xk2q07]];

- Deductive code trees can be specified using YAML

The rock **R Package Functions**

The most important functions are parse_source() to parse one source and parse_sources() to parse multiple sources simultaneously. clean_source() and clean_sources() can be used to clean sources, and prepend_ids_to_source() and prepend_ids_to_sources() can be used to quickly generate UIDs and prepend them to each utterance in a source.

For analysis, create_cooccurrence_matrix(), collapse_occurrences(), and collect_coded_fragments() can be used.

---

root_from_codePaths   *Get the roots from a vector with code paths*

Description

Get the roots from a vector with code paths

Usage

```
root_from_codePaths(x)
```

Arguments

x   A vector of code paths.

Value

A vector with the root of each element.

Examples

```
root_from_codePaths(
  c("codes>reason>parent_feels",
    "codes>reason>child_feels")
);
```

---

rpe_create_source_with_items
                          Create a source with items to code for Response Process Evaluation

---

Description

This function creates a plain text file, a .rock source, that can be coded when conducting Response Process Evaluation.

Usage

```
rpe_create_source_with_items(
  data,
  iterationId,
  batchId,
  populationId,
  itemVarNames,
  metaquestionIdentifiers,
  metaquestionVarNames,
  itemContents,
  metaquestionContents,
  coderId,
  caseIds = NULL,
  outputFile = NULL,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

Arguments

data	A (wide) data frame containing at least the participants' answers to the items and to the meta questions (but optionally, the iteration, batch, and population).
iterationId, batchId, populationId	
	If the iteration, batch, and population identifiers are contained in the data frame passed as `data`, the variable names holding that information for each participant; otherwise, either a single value or a vector of length `nrow(data)` that contains that information for each participant.
itemVarNames	The variable names with the participants' responses to the items, in a named character vector, with each element's name being the item's identifier, and each element the variable name in `data` holding the participants' responses to the item.
metaquestionIdentifiers	
	A named list of unnamed character vectors, with each character vector element specifying the identifier of a meta question, and each list element (i.e. the name of each character vector) specifying the item identifier that the meta questions in the corresponding character vector belong to.
metaquestionVarNames	
	The variable names with the participants' responses to the meta questions, in a named character vector, with each element's name being the meta question's identifier, and each element the variable name in `data` holding the participants' responses to the meta question.
itemContents	A named character vector with each item's content, with the values being the content and the names the item identifiers.
metaquestionContents	
	A named character vector with each meta question's content, with the values being the content and the names the meta question identifiers.

coderId	The identifier of the coder that will code this source.
caseIds	The variable name with the participants' case identifiers (i.e. a unique identifier for each participant).
outputFile	Optionally, a file to write the source to.
preventOverwriting	Whether to overwrite existing files (FALSE) or prevent that from happening (TRUE).
encoding	The encoding to use when writing the source(s).
silent	Whether to the silent (TRUE) or chatty (FALSE).

Value

The created source, as a character vector (invisibly);

---

save_workspace	*Save your justifications to a file*

Description

When conducting analyses, you make many choices that ideally, you document and justify. This function saves stored justifications to a file.

Usage

```
save_workspace(
  file = rock::opts$get("justificationFile"),
  encoding = rock::opts$get("encoding"),
  append = FALSE,
  preventOverwriting = rock::opts$get("preventOverwriting"),
  silent = rock::opts$get("silent")
)
```

Arguments

file	If specified, the file to export the justification to.
encoding	The encoding to use when writing the file.
append	Whether to append to the file, or replace its contents.
preventOverwriting	Whether to prevent overwriting an existing file.
silent	Whether to be silent or chatty.

Value

The result of a call to `justifier::export_justification()`.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Load example source
loadedExample <- rock::load_source(exampleFile);

### Split a code into two codes, showing progress (the backticks are
### used to be able to specify a name that starts with an underscore)
recoded_source <-
  rock::recode_split(
    loadedExample,
    codes="childCode1",
    splitToCodes = list(
      `_and_` = " and ",
      `_book_` = "book",
      `_else_` = TRUE
    ),
    silent=FALSE,
    justification = "Because this seems like a good idea"
  );

### Save this workspace to a file
temporaryFilename <- tempfile();
rock::save_workspace(file = temporaryFilename);
```

show_attribute_table   *Show a table with all attributes in the RStudio viewer and/or console*

Description

Show a table with all attributes in the RStudio viewer and/or console

Usage

```
show_attribute_table(
  x,
  output = rock::opts$get("tableOutput"),
  tableOutputCSS = rock::opts$get("tableOutputCSS")
)
```

Arguments

x   A `rock_parsedSources` object (the result of a call to `rock::parse_sources`).

output   The output: a character vector with one or more of `"console"` (the raw concate-
                  nated input, without conversion to HTML), `"viewer"`, which uses the RStudio
                  viewer if available, and one or more filenames in existing directories.

tableOutputCSS   The CSS to use for the HTML table.

Value

x, invisibly, unless being knitted into R Markdown, in which case a knitr::asis_output()-
wrapped character vector is returned.

---

show_fullyMergedCodeTrees

Show the fully merged code tree(s)

Description

Show the fully merged code tree(s)

Usage

```
show_fullyMergedCodeTrees(x)
```

Arguments

x   A parsed source(s) object.

Value

The result of a call to DiagrammeR::render_graph().

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Load example source
loadedExample <- rock::parse_source(exampleFile);

### Show merged code tree
show_fullyMergedCodeTrees(loadedExample);
```

show_inductive_code_tree
                        Show the inductive code tree(s)

Description

This function shows one or more inductive code trees.

Usage

```
show_inductive_code_tree(
  x,
  codes = ".*",
  output = "both",
  headingLevel = 3,
  nodeStyle = list(shape = "box", fontname = "Arial"),
  edgeStyle = list(arrowhead = "none"),
  graphStyle = list(rankdir = "LR")
)
```

Arguments

x	A `rock_parsedSources` object (the result of a call to `rock::parse_sources`).
codes	A regular expression: only code trees from codes coded with a coding pattern with this name will be shown.
output	Whether to show the code tree in the console (`text`), as a plot (`plot`), or both (`both`).
headingLevel	The level of the heading to insert when showing the code tree as text.
nodeStyle, edgeStyle, graphStyle	
	Arguments to pass on to, respectively, `data.tree::SetNodeStyle()`, `data.tree::SetEdgeStyle()`, and `data.tree::SetGraphStyle()`.

Value

x, invisibly, unless being knitted into R Markdown, in which case a `knitr::asis_output()`-wrapped character vector is returned.

---

split_long_lines *Split long lines*

Description

This function splits long lines at a given number of characters, keeping words intact. It's basically a wrapper around `strwrap()`.

Usage

```
split_long_lines(
  x,
  length = 60,
  splitString = rock::opts$get("utteranceMarker")
)
```

Arguments

x	The string (e.g. a source)
length	The maximum length
splitString	The character to use to split lines.

Value

A character vector.

Examples

```
cat(
  rock::split_long_lines(
    paste0(
      "Lorem ipsum dolor sit amet, consectetur adipiscing elit. ",
      "Vestibulum et dictum urna. Donec neque nunc, lacinia vitae ",
      "varius vitae, pretium quis nibh. Aliquam pulvinar, lacus ",
      "sed varius vulputate, justo nibh blandit quam, ",
      "nec sollicitudin velit augue eget erat."
    )
  )
);
```

---

stripCodePathRoot *Strip the root from a code path*

Description

This function strips the root (just the first element) from a code path, using the codeTreeMarker stored in the opts object as marker.

Usage

```
stripCodePathRoot(x)
```

Arguments

x   A vector of code paths.

Value

The modified vector of code paths.

Examples

```
stripCodePathRoot("codes>reason>parent_feels");
```

---

syncing_df_compress *Compress a vector or data frame*

Description

Compress a vector or data frame

Usage

```
syncing_df_compress(
  x,
  newLength,
  sep = " ",
  compressFun = NULL,
  compressFunPart = NULL,
  silent = rock::opts$get("silent")
)

syncing_vector_compress(
  x,
  newLength,
  sep = " ",
```

```
  compressFun = NULL,
  compressFunPart = NULL,
  silent = rock::opts$get("silent")
)
```

Arguments

x	The vector or data frame
newLength	The new length (or number of rows for a data frame)
sep	When not specifying compressFun and compressFunPart, the paste function is used to combine elements, and in that case, sep is passed to paste as separator.
compressFun	If specified, when compressing streams, instead of pasting elements together using separator sep, the vectors are passed to function compressFun, which must accept a vector (to compress) and a single integer (with the desired resulting length of the vector).
compressFunPart	
	A function to apply to the segments that are automatically created; this can be passed instead of compressFun.
silent	Whether to be silent or chatty.

Value

The compressed vector or data frame

Examples

```
rock::syncing_vector_compress(
  1:10,
  3
);

rock::syncing_df_compress(
  mtcars[, 1:4],
  6
);

rock::syncing_df_compress(
  mtcars[, 1:4],
  6,
  compressFunPart = mean
);
```

syncing_df_expand   *Expand a vector or data frame*

Description

Expand a vector or data frame

Usage

```
syncing_df_expand(
  x,
  newLength,
  fill = TRUE,
  expandFun = NULL,
  silent = rock::opts$get("silent")
)

syncing_vector_expand(
  x,
  newLength,
  fill = TRUE,
  expandFun = NULL,
  silent = rock::opts$get("silent")
)
```

Arguments

x	The vector or data frame
newLength	The new length (or number of rows for a data frame)
fill	When expanding streams, whether to duplicate elements to fill the resulting vector. Ignored if fillFun is specified.
expandFun	If specified, when expanding streams, instead of potentially filling the new larger vector with elements (if fill is TRUE), the vectors are passed to function expandFun, which must accept a vector (to compress) and a single integer (with the desired resulting length of the vector).
silent	Whether to be silent or chatty.

Value

The expanded vector

Examples

```
rock::syncing_vector_expand(letters[1:10], 15);
rock::syncing_vector_expand(letters[1:10], 15, fill=FALSE);
```

---

sync_streams *Synchronize multiple streams*

Description

This function maps the codes from multiple streams onto a primary stream.

Usage

```
sync_streams(
  x,
  primaryStream,
  columns = NULL,
  anchorsCol = rock::opts$get("anchorsCol"),
  sourceId = rock::opts$get("sourceId"),
  streamId = rock::opts$get("streamId"),
  prependStreamIdToColName = FALSE,
  appendStreamIdToColName = FALSE,
  sep = " ",
  fill = TRUE,
  compressFun = NULL,
  compressFunPart = NULL,
  expandFun = NULL,
  colNameGlue = rock::opts$get("colNameGlue"),
  silent = rock::opts$get("silent")
)
```

Arguments

x	The object with the parsed sources.
primaryStream	The identifier of the primary stream.
columns	The names of the column(s) to synchronize.
anchorsCol	The column containing the anchors.
sourceId	The column containing the source identifiers.
streamId	The column containing the stream identifiers.
prependStreamIdToColName, appendStreamIdToColName	
	Whether to append or prepend the stream identifier before merging the dataframes together.
sep	When not specifying compressFun and compressFunPart, the paste function is used to combine elements, and in that case, sep is passed to paste as separator.
fill	When expanding streams, whether to duplicate elements to fill the resulting vector. Ignored if fillFun is specified.

compressFun   If specified, when compressing streams, instead of pasting elements together us-
                ing separator sep, the vectors are passed to function compressFun, which must
                accept a vector (to compress) and a single integer (with the desired resulting
                length of the vector).

compressFunPart
                A function to apply to the segments that are automatically created; this can be
                passed instead of compressFun.

expandFun   If specified, when expanding streams, instead of potentially filling the new larger
                vector with elements (if fill is TRUE), the vectors are passed to function expandFun,
                which must accept a vector (to compress) and a single integer (with the desired
                resulting length of the vector).

colNameGlue   When appending or prepending stream identifiers, the character(s) to use as
                "glue" or separator.

silent   Whether to be silent (TRUE) or chatty (FALSE).

Value

The object with parsd sources, x, with the synchronization results added in the $syncResults
subobject.

Examples

```
### Get a directory with example sources
examplePath <-
  file.path(
    system.file(package="rock"),
    'extdata',
    'streams'
  );

### Parse the sources
parsedSources <- rock::parse_sources(
  examplePath
);

### Add a dataframe, syncing all streams to primary stream !
parsedSources <- rock::sync_streams(
  parsedSources,
  primaryStream = "streamA",
  columns = c("Code1", "Code2", "Code3"),
  prependStreamIdToColName = TRUE
);

### Look at two examples
parsedSources$syncResults$mergedSourceDf[
  ,
  c("streamB_Code3", "streamC_Code1")
];
```

---

sync_vector *Sync (expand or compress) a vector*

Description

Sync (expand or compress) a vector

Usage

```
sync_vector(
  x,
  newLength,
  sep = " ",
  fill = TRUE,
  compressFun = NULL,
  expandFun = NULL,
  compressFunPart = NULL,
  silent = rock::opts$get("silent")
)
```

Arguments

x	The vector
newLength	The new length
sep	When not specifying `compressFun` and `compressFunPart`, the `paste` function is used to combine elements, and in that case, `sep` is passed to `paste` as separator.
fill	When expanding streams, whether to duplicate elements to fill the resulting vector. Ignored if `fillFun` is specified.
compressFun	If specified, when compressing streams, instead of pasting elements together using separator `sep`, the vectors are passed to function `compressFun`, which must accept a vector (to compress) and a single integer (with the desired resulting length of the vector).
expandFun	If specified, when expanding streams, instead of potentially filling the new larger vector with elements (if `fill` is TRUE), the vectors are passed to function `expandFun`, which must accept a vector (to compress) and a single integer (with the desired resulting length of the vector).
compressFunPart	
	A function to apply to the segments that are automatically created; this can be passed instead of `compressFun`.
silent	Whether to be silent or chatty.

Value

The synced vector

Examples

```
rock::sync_vector(letters[1:10], 15);
rock::sync_vector(letters[1:10], 5);
```

---

template_ci_heatmap_1_to_pdf

Create a templated report for cognitive interviews

Description

Use this function to export a templated report for cognitive interviews. To embed it in an R Markdown file, use !!! CREATE rock::knit_codebook() !!!

Usage

```
template_ci_heatmap_1_to_pdf(
  x,
  file,
  title = "Cognitive Interview: Heatmap and Coded Fragments",
  author = NULL,
  caption = "Heatmap",
  headingLevel = 1,
  silent = rock::opts$get("silent")
)
```

Arguments

x	The codebook object (as produced by a call to [parse_sources()]().
file	The filename to save the codebook to.
title	The title to use.
author	The author to specify in the PDF.
caption	The caption for the heatmap.
headingLevel	The level of the top-most headings.
silent	Whether to be silent or chatty.

Value

x, invisibly

Examples

```
### Use a temporary file to write to
tmpFile <- tempfile(fileext = ".pdf");

### Load an example CI
examplePath <- file.path(system.file(package="rock"), 'extdata');
parsedCI <- parse_source(file.path(examplePath,
                                   "ci_example_1.rock"));

rock::template_ci_heatmap_1_to_pdf(
  parsedCI,
  file = tmpFile
);
```

---

template_codebook_to_pdf

Convert a codebook specification to PDF

Description

Use this function to export your codebook specification to a PDF file. To embed it in an R Markdown file, use !!! CREATE rock::knit_codebook() !!!

Usage

```
template_codebook_to_pdf(
  x,
  file,
  author = NULL,
  headingLevel = 1,
  silent = rock::opts$get("silent")
)
```

Arguments

x	The codebook object (as produced by a call to `codebook_fromSpreadsheet()`).
file	The filename to save the codebook to.
author	The author to specify in the PDF.
headingLevel	The level of the top-most headings.
silent	Whether to be silent or chatty.

Value

x, invisibly

Examples

```
### Use a temporary file to write to
tmpFile <- tempfile(fileext = ".pdf");

### Load an example codebook
data("exampleCodebook_1", package = "rock");

rock::template_codebook_to_pdf(
  exampleCodebook_1,
  file = tmpFile
);
```

---

vecTxt   *Easily parse a vector into a character value*

Description

Easily parse a vector into a character value

Usage

```
vecTxt(
  vector,
  delimiter = ", ",
  useQuote = "",
  firstDelimiter = NULL,
  lastDelimiter = " & ",
  firstElements = 0,
  lastElements = 1,
  lastHasPrecedence = TRUE
)

vecTxtQ(vector, useQuote = "'", ...)
```

Arguments

vector	The vector to process.
delimiter, firstDelimiter, lastDelimiter	
	The delimiters to use for respectively the middle, first firstElements, and last lastElements elements.
useQuote	This character string is pre- and appended to all elements; so use this to quote all elements (useQuote="'"), doublequote all elements (useQuote='"'), or anything else (e.g. useQuote='|'). The only difference between vecTxt and vecTxtQ is that the latter by default quotes the elements.

firstElements, lastElements

> The number of elements for which to use the first respective last delimiters

lastHasPrecedence

> If the vector is very short, it's possible that the sum of firstElements and lastElements is larger than the vector length. In that case, downwardly adjust the number of elements to separate with the first delimiter (TRUE) or the number of elements to separate with the last delimiter (FALSE)?

...   Any addition arguments to vecTxtQ are passed on to vecTxt.

Value

A character vector of length 1.

Examples

```
vecTxtQ(names(mtcars));
```

---

wrapVector   *Wrap all elements in a vector*

Description

Wrap all elements in a vector

Usage

```
wrapVector(x, width = 0.9 * getOption("width"), sep = "\n", ...)
```

Arguments

x	The character vector
width	The number of
sep	The glue with which to combine the new lines
...	Other arguments are passed to [strwrap()]().

Value

A character vector

Examples

```
res <- wrapVector(
  c(
    "This is a sentence ready for wrapping",
    "So is this one, although it's a bit longer"
  ),
  width = 10
);

print(res);
cat(res, sep="\n");
```

---

write_source   *Write a source to a file*

Description

These functions write one or more source(s) from memory (as loaded by load_source() or load_sources())
to a file.

Usage

```
write_source(
  x,
  output,
  encoding = rock::opts$get("encoding"),
  preventOverwriting = rock::opts$get("preventOverwriting"),
  silent = rock::opts$get("silent")
)

write_sources(
  x,
  output,
  filenamePrefix = "",
  filenameSuffix = "_written",
  encoding = rock::opts$get("encoding"),
  silent = rock::opts$get("silent")
)
```

Arguments

x	The source(s).
output	The filename (for rock::write_source()) or path (for rock::write_sources()) to write to.
encoding	The encoding to use.

preventOverwriting

> Whether to prevent against overwriting of the file(s) to write. Set to `FALSE` to overwrite.

silent   Whether to be chatty or quiet.

filenamePrefix, filenameSuffix

> Optional prefixes or suffixes to pre- or append to the filenames when writing the files.

Value

Invisibly, the input (x), to enable chaining in pipes.

Examples

```
### Get path to example source
examplePath <-
  system.file("extdata", package="rock");

### Get a path to one example file
exampleFile <-
  file.path(examplePath, "example-1.rock");

### Get a temporary file to write to
tempFile <- tempfile(fileext = ".rock")

### Pipe chain to load the example source; add a code;
### and write the result to disk
loadedSource <-

  rock::load_source(exampleFile) |>

  rock::code_source(c("Lorem Ipsum" = "lorumIpsum")) |>

  rock::write_source(tempFile);
```

---

yaml_delimiter_indices

Get indices of YAML delimiters

Description

Get indices of YAML delimiters

Usage

```
yaml_delimiter_indices(x)
```

Arguments

x   The character vector.

Value

A numeric vector.

Examples

```
yaml_delimiter_indices(
  c("not here",
    "---",
    "above this one",
    "but nothing here",
    "below this one, too",
    "---")
);
### [1] 2 6
```

Index
